Inventories and library catalogs: Upon the owner’s death, estate and house inventories were prepared that included art and furniture among other collectibles. Following this age-old practice, lists of book collections were first produced in manuscript versions. Early inventories are frequently organized in the order of rooms, according to the shelves and cabinets where books were kept. Arrangements of books in libraries were important elements in the process of creating a collection, and locations were subsequently recorded in catalogs. Sometimes lists and catalogs were organized by physical sizes, possibly relating to their storage or shelving orders, and booklists bear headings for octavos, folios, and portfolios. Within subject categorizations (such as history, religion, travel, festivals), early catalogs describe books briefly by authors and catch titles. Inconveniently for current researchers, the full form of a bibliographical citation (e.g., author, title, place, publisher, and date) by which books are identified according to current practice was almost never used in the early modern period. Therefore, it is often very difficult to identify specific copies or editions without further historical context or knowledge of the physical features of volumes, such as authors’ signatures, bookplates, or bindings. Collocating the collector’s printed works on paper, book catalogs often included prints and maps. Rather than single sheets, both maps and prints were frequently bound into albums for purposes of carriage and storage. Indeed, in the context of early modern collections, portfolios or albums of prints looked like books, although they lacked bibliographical features such as title pages. Given the brief mentions in early inventories and catalogs, it is often difficult to identify items exactly without the aid of further information from biographical, bibliographical, or historical sources.

According to their date of purchase, handwritten library catalogs were entered in ledger books in accession order. Fortunately, some meticulous bibliophiles did include details of their acquisitions, noting where, from whom, and how much the book costs. Parallel to the utility of booksellers’ and dealers’ catalogs that advertised books, when discovered, such documentary archives of collecting activity are mines of information that detail provenance, illuminating the history of book production and circulation. When a private library reached critical mass, collectors occasionally prepared owner’s catalogs of their collections and had them privately printed. These were not intended for sale but rather for bibliophilic purposes, recognizing the collector’s efforts, disseminating information about the collection, and publishing the collector’s own scholarship and comments. Elaborating on the early lists and publications of private rare book collections and early museums, in later centuries, more comprehensive catalogs of libraries and collections of books on specialized subjects were produced. Beyond the utility of their

bibliographic content, these described assemblages of books owned by a collector or held by an institution, and thus they are sometimes useful for determinations of provenance.

Auction sale catalogs and dealers' catalogs: Since the sixteenth century, auctions and dealers' sales have mediated the transfer of books among other collectibles, such as art and antiques, from former owners and estates to new ones. Using inventories or catalogs of collections as their basis, auction sale and dealers' catalogs provide valuable documentation on the contents of libraries and private collections, and specifics on individual books. For provenance, it is especially desirable to find dealers' and collectors' copies of catalogs interleaved with extra paper sheets inserted with notes giving the names of buyers and sale prices. Dealers and collectors routinely marked up their auction catalogs with information about the condition or physical characteristics of the book offered. All types of book inventories and catalogs can be studied not merely as lists but also as authentications of books' presence. They can indicate rarity or the availability of copies for readers. More generally, catalogs can provide an overarching view of the book business, the market for past publications, and genres of collecting.

THE USES AND VALUE OF PROVENANCE

Authentication: Most importantly, precise documentation of a rare book's history helps to establish that it is an authentic object, not a spurious work or facsimile. Careful examination of the material and collation of elements provides evidence of the work's integrity. Occasionally, incidents of war and theft, coupled with greed, conspire to obliterate books' provenance. This blurring of history opens doors for forgeries and fakes whose appearance is accompanied by a fictitious provenance. New owners do not realize the true identities of the works until they embark on research, seek to sell the book, and consult experts such as librarians, curators, or dealers. Ironically, in such cases, although the subject and content of a rare book are quite clear, its loss of provenance can amount to a decontextualized state of biblio-amnesia, like a person found wandering who has forgotten his name and address. On the positive side, books have long lives and can easily traverse national borders and cultural boundaries, passing from readers on to collectors through the centuries. For scholarship, however, the significance of a rare book is enhanced considerably by comprehension of its social meanings and contexts.

Association: For some collectors of art and books, the ability to link a particular work to its author, to a well-known patron, to an eminent collector, or to a prominent historic institution is a primary interest that has made certain books valuable and highly collectible. Book dealers and auction houses reliably stress "good

provenance," indicating that the rare book comes from a famous collection, such as those seen in current citations that track the diaspora of books emanating from the numerous sales of Sir Thomas Phillipps's collections in the nineteenth century. In other association copies, the volume was signed or annotated by a celebrity or a scholar. Noteworthy associations can become the reasons for present-day collectors' pursuits. Occasionally, association becomes the basis upon which a collection or a scholarly project is developed. Collectors like the Los Angeles doctor Elmer Belt sought to reconstruct the components of Leonardo da Vinci's library for the collection now held by UCLA, although it was not possible to do so with the specific volumes. In his scholarly quest of Horace Walpole's bibliographical milieu, Professor Wilmarth Sheldon Lewis at Yale University re-collected the collector's books and manuscripts, seeking volumes and related materials for the Lewis Walpole Library at Yale University, formerly owned by the eighteenth-century author and collector Walpole at Strawberry Hill in England. Conveying the aura of past collecting and taste, so-called association copies convey the pedigree of the collector along with the physical presentation of their rare books. Thus, present owners and libraries also associate themselves with a distinguished lineage of ownership and history of taste.

Book history: Past provenance research has focused on the history of a particular volume for purposes of ascertaining integrity and authentication. Viewed broadly, provenance research can also inform the history of collecting by identifying copies associated with specific readers, scholars, libraries, religious orders, and educational institutions. Inventories and catalogs can assist in identifying single copies and the contents of libraries. Similarly, information gathered in the course of provenance research itself provides data for constructing the history of scholarship and research techniques. It provides responses to specific questions such as "To what books and editions did historic figures have access?" and furnishing facts for histories of reading, research techniques and writing, and literary taste.

CATALOGING PROVENANCE INFORMATION

Until recently, information on previous owners of rare books was infrequently and somewhat erratically included in both dealers' catalogs and sales catalogs, as well as library catalog records. More often it was found in dealers' archives and in libraries' local files, recording physical characteristics of books such as heraldry, bindings, monograms, or embellishments such as fore-edge painting. The 1980s was a watershed for interest in provenance of rare books. Roger Stoddard introduced the topic visually in the innovative 1984 Houghton Library exhibition at Harvard University, *Marks in Books, Illustrated and Explained*. Published in 1985, the large format catalog was "devoted

to those mysterious traces left in books by printer, binders, booksellers, librarians, and collectors.” Stoddard’s explanations are a useful guide to interpreting the often cryptic marks for purposes of identification of owners and readers of books.

In the last three decades, more detailed descriptions of specific copies and editions of rare books in bibliographic databases and in online book trade resources have made substantial contributions to the information now widely available on provenance. The advent of machine-readable cataloging and the proliferation and population of online catalogs not only afforded immediate access to bibliographic data but also provided a convenient venue for tracking ownership in specific volumes. Librarians and scholars realized that searches for provenance information, if data were entered in specific fields and in standard formats, could yield promising amounts of information on individual copies, rarity, past owners, and others who had documented relationships with particular books. Along with two other thesauri on rare publications and historical evidence (Printing and Publishing Evidence, 1986, and Binding Evidence, 1988), the ALA/ACRL Rare Books and Manuscripts Section Standards Committee published Provenance Evidence in 1988 (and it is now available online). These thesauri are intended to be used dynamically by catalogers for terms relating to evidence of provenance, and they contain a useful list of possibilities where provenance in rare books can be discovered.

Most helpfully, the term is “interpreted in its broadest sense to refer not only to former owners in the legal sense, but also to any who may have had temporary custody of the material (such as auction houses or library borrowers) and have left their mark in some way on it.”

In 1997, the Bibliographical Society of America sponsored “Marks in Books,” a conference for European and American researchers at Yale University that considered a range of perspectives on the uses of provenance information and the recording and organization of relevant information. Contributions to the conference were published the same year in the society’s papers. Among these diverse reports on research projects, Paul Needham’s article “Index Possessorum Incunabulorum” presents two simple rules gleaned from his records of provenance. The first and main principle is that “Unindexed provenance is lost provenance.” The second is “Identification of ownerships should be based on definable and classifiable evidence.” Present-day research and cataloging of provenance follow these two general but highly useful guidelines.

Reflecting recent developments in twenty-first-century book history, the Consortium of European Research Libraries (CERL) has put considerable effort into developing the Heritage of the Printed Book Database. Its records of rare books frequently include provenance information, and the CERL home page has a helpful link to its own resources on provenance. The CERL Thesaurus includes provenance records from a number of old and

important German institutions as well as other European libraries. The CERL website also has a Provenance Information section, and some database records now include a digitized image of the ownership marks.

Recently, researchers from the Kislak Center for Special Collections, Rare Books, and Manuscripts at the University of Pennsylvania initiated the Provenance Online Project (POP). Digital images of provenance evidence contained in books, such as inscriptions, labels, bookplates, bindings, and other physical attributes indicating ownership, are available together with bibliographic and descriptive metadata about the books. POP is intended to create a collaborative international workspace and communication space to which librarians, researchers, and collectors can contribute information about the provenance images contained in POP. The goal is to capture and construct identifications of persons who can be associated with specific provenance marks, thus connecting individual copies of books and past owners. POP will ultimately create a network of provenance evidence and bibliographic information. Sparked by an initial group of 1200 images, the project’s unique approach makes visual data easily accessible and enables an open community of users to contribute and exchange information. Although the database initially focused on works from the early modern period, the project is increasingly open to documenting books from any period. In addition, POP is currently expanding beyond Penn’s collections to include images from other libraries’ collections. POP is an innovative resource that demonstrates the growing significance of provenance evidence for research, which takes in book history and material culture, informing the study of past libraries, the uses of texts, and the cultural and geographic groups whose recorded history resides in books.

LEGAL IMPLICATIONS OF PROVENANCE

Insofar as provenance information provides documentation on books’ past owners, their countries of residence, and the time span during which they owned the books, there are overlaps and intersections with national and international laws concerned with export and import. Accurate provenance information can be helpful for the determination of rightful ownership in instances of contention. According to the 1970 UNESCO Convention on the Means of Prohibiting and Preventing the Illicit Import, Export, and Transfer of Ownership of Cultural Property, rare books are included under the category of cultural property. Presently, the European Union defines a rare book as one that is more than 100 years old and valued at more than €50,000 (cf. Consolidated Text produced by the CONSLEG system of the Office for Official Publications of the European communities 1993L0007–July 30, 2001). If a rare book of this age and above this value not presently owned in the United States is acquired by a U.S.

collector or library, it must have an export license when it leaves the European country where it was sold. In addition, the U.S. Customs Service views rare books as cultural property [cf. "Rare manuscripts and incunabula, old books, documents and publications of special interest (historic, artistic, scientific, literary, etc.) singly or in collections" in Works of Art, Collector's Pieces, Antiques, and Other Cultural Property: An Informed Compliance Publication (February 2001); see also <http://www.unesco.org/culture> and <http://www.unidroit.org> for the 1995 UNIDROIT Convention on stolen or illegally exported cultural objects (not yet signed by the United States)]. Therefore, rare books entering the United States from abroad must have import documentation describing the item with the date of publication, price paid, and the country from which it was exported. Because of legal requirements for accuracy, all such information is of great use for identifying specific copies, owners, and institutional holders. In addition, security is enhanced by the detailed identifications of books in private and public collections. In cases of very rare books known in only a few copies, this can assist in establishing the authenticity of the volume. Similarly, although no documentation is usually required for books that have been in the United States for more than 5 years, it is very useful to extend the documentation of ownership back as far as possible in case there are questions concerning ownership similar to those asked about titles to any type of property. Throughout history, in times of war and oppression, looting and theft were widespread. Books frequently became booty or were seized by victors; thus, the entire contents of libraries and private collections were displaced. Likewise in times of peace, along with artworks, books are frequently pawns on political game boards and in legal debates concerning patrimony, cultural restoration, and ongoing attempts to preserve cultural artifacts from wanton destruction.

CONCLUSION: PROVENANCE AND BOOK HISTORY

Traditional rare book collecting has focused on a canon of important books or types (such as herbals and atlases) that chronicles the Western intellectual tradition, well described by bibliographies such as *Printing and the Mind of Man*. Volumes such as Shakespeare's *First Folio*, the *Nuremberg Chronicle*, Vesalius's *Anatomy*, and Newton's *Principia* have been highly collectible for centuries. This focus on a book's subject, particularly a book seen as a seminal work or turning point, provided secure avenues for collecting. More recently, historians and social and literary scholars have turned to studies of individual books as physical objects or artifacts. In this vein, provenance research can be used to identify a sequence of owners and readers who owned and used the books and their social contexts. These clusters of data provide substantial

evidence for rewritings of history that spotlight minor but revealing figures and shed light on less well-known contexts of book use (e.g., Carlo Ginzburg's tale of the sixteenth-century peasant's reading referenced in *The Cheese and the Worms*). Founded in history, the study of books' provenance itself creates innovative perspectives that define new genres hitherto seen as unimportant, describing environments of texts' availability, their communities of reading, and reasons for retention, often outlining less elevated versions of book collecting than were seen in country houses or royal libraries. Studies of particular libraries and collectors not only tell about the sources on which further research and book production is based but also supply a portrait of the world of knowledge in certain times and places. To date, provenance studies have not given much attention to non-American or non-European books and collectors. The increasingly global focus of advanced research in history, literature, and bibliography points toward a new avenue for scholarship that will shed light on cultural practices and cross-cultural exchanges in book history.

Katharine J. Phenix

Northglenn Branch, Rangeview Library District, Northglenn, Colorado, U.S.A.

Abstract

Public librarians are the community's cultural support as providers of lifelong learning, reading, information provision, and a vibrant public sphere for people of all ages. Public librarians provide access to books and all varieties of media to meet the needs of people for education, information, and personal development. This entry focuses on public librarianship as it is practiced in the United States with a brief history of the field's development in two parts: beginnings to 1966 when the field used a national service model and 1966 to the present with a community-based focus. The education, certification, and working conditions of public librarians are reviewed. The philosophical and ethical worldview of practice with a human rights ethos is described. Finally, current (2009) issues in public librarianship are stated.

INTRODUCTION

The *Public Library Manifesto* as set forth by the International Federation of Library Associations and Institutions (IFLA) defines the public library as the local gateway to knowledge, which provides a basic condition for lifelong learning, independent decision-making, and cultural development of the individual and social groups.^[1] Public librarianship as practiced in the twenty-first century is the occupation that provides access to books and all varieties of media to meet the needs of people for education, information, and personal development. This entry will focus on public librarianship as practiced in the United States, but the reader should be aware of the many varieties of public library practice due to the different level of public library development worldwide. At the time of this writing the Public Libraries Section, Standing Committee 2007–2009 of the International Federation of Library Associations and Institutions was comprised of representatives from 20 nations: Canada, Chile, China, Colombia, the Czech Republic, Denmark, Estonia, Finland, Germany, France, Iceland, Malaysia, Nigeria, Norway, the Russian Federation, South Africa, Spain, Sweden, the United Kingdom, the United States, and Uruguay.^[2] The composition of this global committee demonstrates the great variety of nations that support public libraries today. We show here the development of the public library profession in the United States.

THE DEVELOPMENT OF U.S. PUBLIC LIBRARIANSHIP TO 1966

Tax-supported public libraries were established in the United States in mid-nineteenth century New England.^[3] The documentation that provided the foundation for the Boston Public Library in 1852 demonstrates the earliest summary of the intended practice of public librarianship with a focus on developing the collection; support of learning beyond formal schooling; and the intellectual advancement of the whole community.^[4]

Looking back on a century of library development, library historians Ditzion (1947)^[5] and Shera (1949)^[6] attributed the founding of public libraries to idealism and a societal commitment to education, while later historians such as Harris (1973),^[7] Garrison (1979),^[8] and Wiegand (1989),^[9] took into consideration the element of societal control as crafted by the male gentry elite. As is true with much history, public librarianship was initially narrated through the biographies of men. Biographies of founders of the profession such as Justin Winsor (Boston Public Library, 1867–1877) or William Frederick Poole (Cincinnati Public Library, 1869–1873, Chicago Public Library, 1873–1887) were the backdrop to understanding the field of public librarianship during the first century of service.

But from the vantage point of the twenty-first century, the growth of public librarianship following the establishment of the American Library Association in 1876 is now

more broadly understood in the context of a more progressive and humanitarian service style that owes much to the participation of women. Women comprise the majority of workers in public libraries—about 80% of public library workers are women. The historical evolution of the role of women in the field must be viewed as a reflection of the role of women in the larger society. It was not until the work of Weibel,^[10] Maack,^[11] and Hildenbrand^[12] that the historical library past vis-à-vis women's central role began to be reclaimed. And it is only in the recent decades that the history of public librarianship has come to be understood against the backdrop of race, gender, and class as so cogently analyzed by Pawley.^[13]

Many factors combined to increase the number of libraries established in the United States from 1876 to 1966. Prominent were 1) philanthropy including that of Andrew Carnegie; 2) the creation of new libraries often at the urging of women's clubs; 3) the establishment of state library commissions; 4) laws enabling tax-supported public libraries; and 5) national level legislation such as the Library Services Act (LSA, 1956). The LSA was designed to support rural library services. Successor legislation, the Library Services and Construction Act (LSCA, 1966), included support for all public libraries, and funded construction as well as services.^[3,14–16]

As libraries began to be established in communities across the United States the scope of public librarianship as an occupation expanded. In addition to the administration, development and organization of collections specializations emerged. Three specializations that developed between 1876 and 1966 were adult education and services, service to youth, and service to special groups.

Adult education and service: The American Library Association was linked closely with the adult education movement in the first decades of the twentieth century. During the 1920s Learned's report to the Carnegie Corporation, *The American Public Library and the Diffusion of Knowledge*, and the ALA Commission on the Library and Adult Education report, *Libraries and Adult Education* provided philosophical rationales for the public library as an extension of public education.^[3,17–20] In 1934 John Chancellor was appointed to the ALA headquarters staff to initiate a 10-year assessment of adult education and public libraries. Public librarians developed skills and techniques to accomplish adult education through readers' advisory, services to organizations, and establishment of discussion groups. With funding from the Ford Foundation, the ALA set up an Office for Adult Education from 1951 to 1961 for political education and Great Books discussion.^[3,21,22] The role of public librarians as adult educators laid the basis for the ongoing support of public libraries as major contributors to lifelong learning and the preservation of cultural heritage. By the 1960s these ideas were challenged as librarians moved to community-based service provision.

Serving Youth: Public librarians serving youth have played an essential role in library development. While men dominated the administration of public libraries because of the public library's initial association with scholarship—a male sphere—a dedicated group of female librarians worked to develop books, magazines, and libraries for young people. Vandergrift has written the history of the first women who fought to establish and to expand service to young people in libraries, while developing a national and international presence for their philosophy and practices. Those interested in children's work in libraries came together in the Children's Librarians Club of ALA in 1900, which then became the Section for Library Work with Children. It was not until 1951 when the American Association of School Librarians (AASL) separated from what was then the Division of Libraries for Children and Young People that the missions of the two types of institutions became distinctly different.^[23] Minerva Sanders, Lutie E. Stearns, Caroline Hewins, Anne Carroll Moore, and Effie Louise Power were pioneers of youth services in public libraries and their biographies provide insight into the development of services to children and young adults in the twentieth century.

Serving Immigrants and Minorities: Public librarians have also worked diligently to assist immigrants and minorities as a central part of their mission and librarians have developed expertise in working with underserved groups. In 1918 the American Library Association established the Committee on Work with the Foreign Born to address the needs of immigrants for library services, but also to assist with "Americanization."^[24] This assimilation movement gradually became less of a rationale as librarians expanded their focus to work with people within the context of the adult education movement.^[25]

Because the U.S. southern states did not permit African-Americans to use public libraries segregated facilities were established in some cities such as Charlotte, North Carolina; Houston, Texas; and Memphis, Tennessee. But very few libraries surveyed in 1922 employed African Americans or made special effort to serve this community. Although there were some notable exceptions such as the Harlem branch of the New York Public Library, few African-Americans had library services until the New Deal initiatives of the 1930s under President Franklin Roosevelt. By 1941 only four states had integrated library services for all.^[26–29]

The Public Library Inquiry: "The Public Library Inquiry," a research and report initiative, shaped the way public librarianship was viewed as a profession following the Second World War. The publication of the series of volumes that comprised the "Public Library Inquiry" took place from 1947 to 1952 and are viewed by Raber as a professional legitimizing project and an exercise in identity creation that relied on public librarians viewing themselves as sustainers of democracy.^[30]

The emphasis on the need to serve opinion leaders based on the assumption they constituted the library's "natural" and most likely audience—an assumption not entirely wrong—because they were educated and more likely to be readers as reported by the "Public Library Inquiry" authors became part of the long conversation throughout the 1950s that caused librarians to reconsider their practice and expand their methods of providing service to all people.^[31]

COMMUNITY-BASED PUBLIC LIBRARIANSHIP—1966 TO THE TWENTY-FIRST CENTURY

In the 1960s widespread recognition grew that U.S. society was split into a nation of rich and poor—that there was, indeed a "Other America." The "War on Poverty" declared by Lyndon B. Johnson in his State of the Union speech on January 8, 1964 affected the future of public library service and caused members of the American Library Association to launch a series of initiatives that responded to the reality of poverty and marginalization. The Social Responsibilities Round Table was begun within the ALA and a Coordinating Committee on Library Service to the Disadvantaged established. These new units within the national association provided context for public librarians' growing realization that the 1966 *Standards for Public Library Systems* did not clearly address the needs of all people.^[32] The 1966 *Standards* were unacceptable to the field for many different reasons; including their perceived irrelevancy to emerging "modern" and evidenced-based management methods, i.e., output-driven effectiveness measures related to local conditions and goals. The 1966 *Standards* and the three prior sets of standards that had been issued by U.S. public librarians in 1933, 1943, and 1956 had defined public library services and staffing from a national perspective. After 1966 the Public Library Association launched a review of goals that resulted in a paradigmatic shift in the practice of public librarianship in the United States.^[3]

Instead of top-down national standards public librarianship shifted to a planning model that sought input from library users. After 1966 public librarians no longer based service development on external guidelines, but worked collaboratively with their communities to analyze, set objectives, make decisions, and evaluate achievements. Pungitore has studied this innovation which resulted in community-based public librarianship based on the needs of the people rather than the standards formed by experts.^[33] The core documents that were the foundation for the planning model of public library services were issued in two phases: 1) "Planning and Role Setting for Public Libraries" (1980–1995) based on *A Strategy for Public Library Change*,^[34] and 2) the "New Planning for Results" approach (1995–present) based on the premise that resource allocation

decisions must be subordinate to and driven by the library's service priorities.^[35] This signaled a major change of public librarianship's and the public librarian's identity; from humanitarian/scholarly to bureaucratic/manager practitioner. For lack of a better word, this represented a "paradigm" shift, although clearly the two identities still exist as opposing points of tension within librarianship's identity.

The practice of public librarianship in the twenty-first century United States as conceived by those involved in the development of the Public Library Association's "New Planning for Results" model is about managing change. The 2008 guide, *Strategic Planning for Results*, identified 18 service responses that were selected by public librarians through several years of meetings and interactive discussion. These 18 service responses will guide the practice of public librarianship in the United States for the next decade.^[36,37] Each response defines a different specialization for public librarianship such as youth services, adult services, information technology, programming, community service, literacy educator, information services, collection development, and career guidance and planning.

The service responses set forth in *Strategic Planning for Results* are

1. "Be an Informed Citizen: Local, National and World Affairs."
2. "Build Successful Enterprises: Business and Non-profit Support."
3. "Celebrate Diversity: Cultural Awareness."
4. "Connect to the Online World: Public Internet Access."
5. "Create Young Readers: Early Literacy."
6. "Discover Your Roots: Genealogy and Local History."
7. "Express Creativity: Create and Share Content."
8. "Get Facts Fast: Ready Reference."
9. "Know Your Community: Community Resources and Services."
10. "Learn to Read and Write: Adults, Teens and Family Literature."
11. "Make Career Choices: Job and Career Development."
12. "Make Informed Decisions: Health, Wealth and Other Life Choices."
13. "Satisfy Curiosity: Lifelong Learning."
14. "Stimulate Imagination: Reading, Viewing and Listening for Pleasure."
15. "Succeed in School: Homework Help."
16. "Understand How to Find, Evaluate, and Use Information: Information Fluency."
17. "Visit a Comfortable Place: Physical and Virtual Spaces."
18. "Welcome to the United States: Services for New Immigrants."

In addition to this strategic planning model based on responses as promoted and developed at the national level, over 20 individual states have defined library services through state association standards.^[38] Some states such as Wisconsin and Florida tie staffing to the state administrative code or statutes. An understanding of the working conditions of public librarianship requires reference to specific state standards and/or local level ordinances and civil service regulations as well as the national approach as outlined in the Public Library Association's *Strategic Planning for Results*.^[37]

EDUCATION, CERTIFICATION, AND WORKING CONDITIONS OF PUBLIC LIBRARY WORKERS

The "librarian" designation generally refers to individuals who hold the master's degree in library and information science from a program accredited by the American Library Association. Public libraries in the United States employed 140,000 paid full-time-equivalent (FTE) staff and "librarians" (staff with the credential from an accredited program) accounted for 33% of that total in the most recent government report (2008). Other library workers include library technicians, library assistants, clerks, and shelvees. These individuals worked at 9,208 public libraries (administrative entities) in the 50 states and the District of Columbia with 16,592 service stationary points (central libraries, branches) and 819 bookmobiles. They managed multiple materials in different formats as public libraries hold 807.2 million print materials, 42.6 million audio materials, and 43.9 million video materials, in their collections. They served people of all ages during 1.4 billion library visits—4.8 per capita. Serving youth was a special focus as circulation of material to children was 728.1 million items and 57.6 million children attended programs at public libraries. Provision of access to technology was a key service as 334 million uses were made at 196,000 Internet terminals available in public libraries nationwide.^[39]

In 2005 the American Library Association-Allied Professional Association (ALA-APA) launched the Certified Public Library Administrator (CPLA) program, a voluntary post-MLS certification program for public librarians with 3 years or more of supervisory experience. The CPLA certification is intended to further professional education and development so that public librarians can move to a higher level of practical professional experience; improve career opportunities; demonstrate that the certified person has acquired a nationally and professionally recognized body of knowledge and expertise in public library administration; and improve the quality of library service through the provision of practical knowledge and skills essential to successful library management.^[40]

The salaries of U.S. public librarians can be reviewed on the "Library Salary Database" maintained by the ALA-

APA. The 2007 median salaries for public librarians in 2007 were: Directors: \$77,200; Associate Directors: \$74,942; Department Heads: \$60,327; Librarians who do not supervise: \$47,772, and beginning public librarians: \$41,334.^[41]

There is no national union for public librarians. Instead local public libraries affiliate with unions like AFSCME (Boston Public Library, Brooklyn Public Library, Milwaukee Public Library, Los Angeles Public Library), SEIU (San Francisco Public Library, Orange County Florida), and various other unions such as the Civil Service Employee Association, United Public Employees of California, and the National Association of Government Employees.^[42] Collective bargaining may be the library alone or in collaboration with a larger employee union. Union librarians earned an average of over 29% more than nonunion librarians in 2006.^[43]

General advancement of the welfare of public librarians is addressed by national association such as the Public Library Association, and the ALA-APA as well as by local chapters/state associations that have annual workshops and programs for librarian development. The Public Library Association 2008 conference, for example, included the program, "How to Work Positively and Constructively in a Unionized Environment."

HUMAN RIGHTS: THE ETHICAL AND PHILOSOPHICAL WORLDVIEW OF PUBLIC LIBRARIANS IN THE TWENTY-FIRST CENTURY

Public librarians have developed philosophical and ethical statements and documents that guide daily practice. While there is little documentation as to underlying philosophies in these various guidelines and statements, we know that the profession has drawn from a variety of traditions of justice as ancient as the Code of Hammurabi (1780 B.C.) right on up to the *Universal Declaration of Human Rights* (1948) and subsequent treaties.

Many of librarianship's key statements and guidelines such as the *Code of Ethics of the American Library Association* and *Library Bill of Rights (LBR)* are shared by all librarians. The *LBR* was adopted in its current form by the Council of the American Library Association on June 18th, 1948 and is Policy 53.1 of the *ALA Policy Manual*.^[44] In 1961 the *LBR* was amended to include civil rights to ensure library rights are not denied because of race, religion, national origin, or political views. In 1980 and again in 1996, ALA reaffirmed these rights to persons of all ages. The final section on access in the *LBR* states: "A person's right to use a library should not be denied or abridged because of origin, age, background, or views."

In 1971 the American Library Association Office of Intellectual Freedom collected Interpretations of the *Library Bill of Rights*. Political, social and technological

history is reflected in these statements and a review demonstrates the convergence of technology and defense of freedom to read. For example, the 1951 statement against labeling arose during the McCarthy era to discourage labeling materials as subversive. It was revised in 1990 to address concerns regarding audiovisual rating guides (53.1.7). Contemporary pressures to limit intellectual freedom and human rights are reflected in statements about infringement of access through electronic filtering (53.1.16), invasion of privacy, which requires a distinction from confidentiality, and recognition of economic barriers (53.1.14).^[45]

In 1991 the American Library Association endorsed the *Universal Right to Freedom of Expression* as set forth in the *Universal Declaration of Human Rights*, adopted by the United Nations General Assembly: "Everyone has the right to freedom of opinion and expression; this right includes freedom to hold opinions without interference and to seek, receive and impart information and ideas through any media and regardless of frontiers."

The Preamble to the *Universal Declaration* states that "...recognition of the inherent dignity and of the equal and inalienable rights of all members of the human family is the foundation of freedom, justice, and peace in the world...and...the advent of a world in which human beings shall enjoy freedom of speech and belief and freedom from fear and want has been proclaimed as the highest aspiration of the common people."

In 1997 the American Library Association passed the "Resolution on IFLA, Human Rights and Freedom of Expression" which committed the association to support of human rights and freedom of expression. Human rights values permeate library policies. As public librarians carry on their work it is inspirational to keep in mind the history of human rights advocacy, and note the work of librarians as essential to the commitment to foster an open society, a public space in the library where democracy lives.^[46-48]

In the philosophical and ethical assessment of the field, *Librarianship and Human Rights: A Twenty-first Century Guide*, Samek has challenged librarians to act on human rights resolutions as a foundation for practice.^[49] In keeping with this 21st mandate for public librarianship we provide three examples that illustrate the way public librarians serve human rights.^[50] Increasingly the challenges and ethical situations public librarians face are given guidance by a human rights orientation for service.

Privacy

(UDHR, Article 12: No one shall be subjected to arbitrary interference with his privacy, family, home or correspondence, nor to attacks upon his honour and reputation. Everyone has the right to the protection of the law against such interference or attacks.)

Connecticut public librarians Peter Chase, George Christian, Janet Nocek, and Barbara Bailey in the *Doe v. Gonzales* case challenged the constitutionality of the nondisclosure provisions of the National Security Letters issued by the government under the USA Patriot Act in terrorist or other investigations. They won.^[51]

People with Disabilities

(UDHR. Article 21: Everyone has the right of equal access to public service in his country.)

The Americans with Disabilities Act Assembly, a representational group administered by the Association of Specialized and Cooperative Library Agencies (ASCLA), a division of the American Library Association, developed the ALA Policy on "Library Services for People with Disabilities" that notes, "Libraries play a catalytic role in the lives of people with disabilities by facilitating their full participation in society. Libraries should use strategies based upon the principles of universal design to ensure that library policy, resources, and services meet the needs of all people."^[52] Recognition that all people have a right to equal access to public service is underscored by public librarianship's commitment to universal libraries. Additionally, services such as the National Library Service for the Blind and Physically Handicapped require collaboration with librarians in community public libraries to activate service.^[53]

Immigrants, People of Color

(UDHR. Article 2: Everyone is entitled to all the rights and freedoms set forth in this Declaration, without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status.)

Public librarians have made great effort to work creatively with people of all backgrounds to deliver fair and equitable service. Library workers reflected on their role in the twenty-first century at the Joint Conference of Librarians of Color (JCLC) in October 2006. This transformative event connected librarians to over-arching societal issues and concerns such as war, economic injustice, environmental challenges, poverty, and racism. The event was a collaboration of the American Indian Library Association, the Asian/Pacific American Librarians Association, the Black Caucus of the American Library Association, the Chinese-American Librarians Association, and REFORMA (National Association to Promote Library Services to the Spanish Speaking). The participants shared experiences, best practices, research, and theory. They made new connections, and built and strengthened coalitions.^[54]

In 2008 the report, *Serving Non-English Speakers in U.S. Public Libraries*, the first national study to consider the range of library services and programs developed for

non-English speakers, including effectiveness of services, barriers to library use, most frequently used services and most successful library programs by language served was released. Researchers found that the most frequently used services by non-English speakers were special language collections (68.9%) and special programming (39.6%), including language-specific story hours and cultural programming.^[55]

THE FUTURE OF PUBLIC LIBRARIANSHIP

As we wrote this entry we discussed the ideas in the air for public librarians in this winter 2009. Because public librarianship is ever changing in reflection of the nature of the communities served and because of the evolution of new technologies there is no static representation that we can use to describe the future. After attending the Public Library Association conference^[56] in spring 2008 the topics that demonstrate the range of concerns that public librarians address today include community as in "One Book, One City";^[57] adult and youth summer reading programs; cultural programming for libraries;^[58] roving reference; serving homeless people;^[59] electronic collections replacing paper; funding in times of fiscal austerity; political advocacy for library support; virtual reference;^[60] fostering civic engagement; LEED certification for green libraries;^[61] the economic impact of public libraries;^[62] and the impact of new technologies; family places and early literacy environments in library space; home library services; and community services Web sites.

Public librarianship ranges from service in small communities where the library worker might take on multiple tasks from budgeting to story-telling to more focused service in large systems and highly specialized practice in local history, genealogy, service to different language users, or web development. The range of a public librarian's possible practice is as diverse as the communities where people live. Some public librarians will practice in sparsely populated rural counties, others in cities; in suburban communities; and still others on bookmobiles that take books and materials to people where they live. Regardless of the site of service public librarians act as the community's cultural support as advocates and providers of resources for lifelong learning, reading, information and the full-range of human capabilities.

Public Libraries *[ELIS Classic]*

Barbara H. Clubb

Ottawa Public Library, Ottawa, Ontario, Canada

Abstract

This entry provides an introduction to public libraries throughout the world including an overview of the mission, roles, services, governance, legal and financial framework, collections, human resources, facilities, marketing and performance measurement. The trends, challenges, issues, and future of public libraries are also discussed. The entry is written from the perspective of informing a new library school student, legislators and decision makers, and/or someone looking to find basic information about the purpose and role of public libraries worldwide.

INTRODUCTION

The institution known universally as the public library is defined by the IFLA/UNESCO Public Library Manifesto as a local gateway to knowledge. It is an institution which provides a basic condition for lifelong learning, independent decision-making and cultural development of the individual and social groups.^[1] It does this primarily through the provision of organized collections of books, documents, audio visual and other electronic and digital media, and related programs and services. Public libraries are a worldwide phenomenon and have existed in various forms for centuries. They occur in a variety of societies, in differing cultures and at different stages of development. Though no one body or institution is responsible for keeping global public library statistics it is estimated that there are over 251,324 public library locations worldwide including main libraries and branches. The United States and Canada respectively have 16,543^[2] and 3100 public library buildings. Although the varied contexts in which public libraries operate inevitably result in differences in the services they provide and the way those services are delivered, public libraries the world over have many characteristics in common and all work toward making a contribution to the improvement of the lives of the citizens they serve and the societies in which they operate.

Since its inception the modern public library has been designed and aspired to be the local center of and access to information and ultimately knowledge. This initially was largely through the medium of print but libraries have always provided access to media in its multiple formats and that now includes digital content. Since their early days public libraries have also played multiple social roles (although book purveying has been a primary role). Public library services are usually provided free (or for a small charge) on the basis of supporting equality of access for all, regardless of age, race, sex or sexual preference, religion, nationality, language or social status or mental or physical

ability. They are funded primarily by local government, but often with assistance from regional/provincial, federal government authorities and established and increasingly supported by mandatory or permissive legislation.^[3]

PURPOSE OF THE PUBLIC LIBRARY

The primary purposes of the public library are to provide facilities, resources, and services in a variety of media (print, audio, visual, electronic/digital) to meet the needs of individuals and groups for both formal and informal education, as well as for information and personal development which includes recreation and leisure. Public libraries have an important role in the development and maintenance of an open and democratic society by giving the individual access to a wide and varied range of knowledge, ideas, and opinions.^[4] Public libraries are considered by many (but not all) citizens and parent governing bodies as essential or core public services which support civic engagement and economic development and which enhance the quality of life in a community.^[5]

The IFLA/UNESCO Public Library Manifesto and Guidelines which were designed and redeveloped over the last 60 years to apply to public libraries worldwide, provide a succinct list of key missions or roles for the modern public library (Table 1). These roles relate to information, literacy, education, culture, and leisure. Of course cultural and political differences between states have significant implications for libraries and the actual meaning of these roles do vary. These key mission statements include creating and strengthening reading habits in children from an early age; supporting both individual and self-conducted education as well as formal education; providing opportunities for personal creative development; stimulating the imagination and creativity of children and young people, promoting awareness of cultural heritage, appreciation of the arts, scientific achievements and

Table 1 Mission and global ends Statements of Markham Public Library, Canada

The Markham Public Library (Markham, Ontario, Canada) is an example of a library that has developed a Mission, Vision and supporting Global ends policies

Vision: *Markham Public Library-the Place where Markham's communities come together to imagine, learn and grow.*

Mission: *We enrich the lives and empower people by providing a spectrum of resources and services that delight our diverse community. You will feel empowered at your library.*

Source: <http://www.markhampubliclibrary.ca/about/mission.asp>

Global Ends Policy: *The Markham Public Library exists to that people who live, work or study in Markham have lifelong, universal and equitable access to the information, and resources that support and contribute to an enriched community.*

- *The community is informed*
- *The community is inspired*
- *The community is empowered*
- *The community is linked*

Source: http://www.markhampubliclibrary.ca/docs/policies/board_policies.pdf

innovation; fostering inter-cultural dialogue and favoring cultural diversity; supporting the oral tradition; ensuring access for citizens to all sorts of community information, providing adequate information services to local enterprises, associations and interest groups; facilitating the development of information and computer literacy skills; and supporting and participating in literacy activities and programs for all age groups, and initiating such activities if necessary.^[1]

Public libraries around the world have interpreted the IFLA Manifesto and Guidelines in different ways:

- In Singapore the stated mission of the National Library Board is to be “an inspiring beacon of lifelong learning, bringing knowledge alive, sparking imagination, and creating possibility for a vibrant and creative Singapore.”^[6]
- In South Africa, where many people particularly in rural areas have inadequate living space and no electricity to enable them to study, public libraries give a high priority to providing the basic facilities, light, tables, and chairs for their users to read and study^[4] (Fig. 1).
- In the Barcelona province in Spain, some library services give support to distance learning students from the Open University in Catalonia.^[4]
- In the state of Queensland, Australia, public libraries provide homework resources and support to upper primary and secondary school children through organized homework clubs in libraries. Electronic homework support is also available.^[7]

In many respects the mandate and role of public libraries has remained timeless and universal throughout the years. However, in the last 30 years, public libraries as public institutions whether in developed countries or developing countries have experienced more change in terms of technology, format, approaches to customer service and democratization than in the previous 200 years. These changes are continuing into the twenty-first century at an accelerated and intensified pace as information and media goes increasingly digital and the way people use public libraries and their perceptions of public libraries continue to evolve.^[8,9] These changing expectations have been

Fig. 1 Mpumalanga Township Library, Kwa-zulu Natal Province, South Africa.

Source: From Barbara Clubb (author).

documented in a number of studies about the perception and use of public libraries. In the OCLC study, *The Perceptions of Libraries and Information Resources*, researchers found that while libraries continue to be trusted information providers, users were not aware of the e-resources of the library, that the library brand (i.e., books) is dated, that users want more self-service and seamless access, and that libraries appear to be losing mindshare of the information-seeking public.^[10] The study *Long Overdue* reported that public libraries get high marks from citizens for service, that computers and Internet access are priority service elements, that there is clear demand for more convenient hours and more service for teens, and that while there is strong community support for libraries, the public is generally unaware of how financially vulnerable libraries are becoming and finally that library representatives need to speak up and reach out if public libraries are to survive and thrive.^[11]

New Roles for Public Libraries

In 2007 the Public Library Association, a division of the American Library Association completed a study to look at the unique roles of American public libraries and their core services today and into the future. The result has been the articulation of 18 new service responses for American public libraries services focusing on citizen outcomes:

- Be informed citizens: local, national, and world affairs.
- Build successful enterprises: business and non-profit support.
- Celebrate diversity: cultural awareness.
- Connect to the online world: public Internet access.
- Create young readers: early literacy.
- Discover your roots: genealogy and local history.
- Express creativity: create and share content.
- Get facts fast: ready reference.
- Know your community: community resources and services.
- Learn to read and write: adult, teen, and family literacy.
- Make career choices: job and career development.
- Make informed decisions: health, wealth, and other life choices.
- Satisfy curiosity: lifelong learning.
- Stimulate the imagination: reading viewing and listening for pleasure.
- Succeed in school: homework help.
- Understand how to find, evaluate, and use information: information fluency.
- Visit a comfortable place: physical and virtual spaces.
- Welcome to newcomers: services for new immigrants.

While these responses echo the IFLA/UNESCO Manifesto and Guidelines, they provide a more precise

definition of service as well as a more clearly stated relationship between the library and its customer within its political and civic environments. They also reflect the new environment in which many public libraries operate particularly with regard to rapidly changing technology and fiscal realities. For instance there is clear emphasis on the library's role to provide public Internet access and to help patrons use information technology and become fluent with new information. In this way, the Public Library Association (PLA) has performed a valuable service and provided a new tool for public libraries worldwide.^[9]

LEGAL AND FINANCIAL FRAMEWORK OF PUBLIC LIBRARIES

To support the level of service proposed by the IFLA/UNESCO Manifesto and the concepts in the new PLA Public Library Responses, strong legislation and sustained funding is essential. Around the world there are a vast array of models which delineate the relationship between the public library and their governing and funding authorities. Depending on the country, the provinces, regions, states, or municipalities are either in whole or in part responsible for service. Usually it is the local municipal unit but often (e.g., some provinces in Canada) two or more levels of government provide a combination of sustained and special purpose funding. In some countries (e.g., Argentina) libraries are required to seek sustained funding from nongovernmental organizations, agencies and/or individuals. Even in developed countries, public libraries are becoming increasingly aggressive and sophisticated in their non-tax fund-raising activities largely from necessity as tax bases are stressed and service demands increase. In North America most public libraries are governed by appointed or elected boards. This is not common in the rest of the world.

The most important instrument for public library development is legislation at either the national and/or state/provincial level combined with provincial and/or national information policies, standards and guidelines. Public library legislation and related regulations vary greatly from country to country and within countries from state to state and region to region. Legislation can be simple or complex, mandatory or permissive, dictatorial or encouraging. Some examples of this variation include:

- Mexico and Venezuela have specific public library legislation whereas in Colombia and Brazil, legislation only includes references to public libraries.
- The Finnish Library Act of 1998, largely regarded as a model piece of legislation, stipulates that the public library should be provided by the municipality, either independently or in cooperation with other public libraries, that public libraries should cooperate with

other types of libraries and that the library should evaluate the library and information services that it provides.

- In Armenia, local authorities have responsibility for the financing and maintenance of public libraries. The Law on Local Self-Government, 1966, defines their obligations for maintaining and developing public libraries.

In addition to specific library legislation, the modern public library must respond increasingly to and/or be compliant with other legislation related to such issues as copyright, financial management, data protection, services for persons with disabilities, pay equity, health and safety, global trade negotiations, intellectual freedom, environmental protection and increasing requirements to develop environmentally supportive or “green” policies, practices and facilities.^[4]

ELEMENTS OF THE PUBLIC LIBRARY

The IFLA/UNESCO Manifesto and the related Guidelines for Development provide a clear framework for understanding and defining public library service no matter what the local context. This entry has already touched upon role and purpose as well as the legal and financial framework. Within this organizational framework major elements of public library service include: meeting the needs of the users; collection development and access; the development of the library’s human resources; the marketing of public libraries and their services and the physical facility—or library as place.

Meeting User Needs

Those responsible for public libraries have always recognized that they must know the size and characteristics of the current and potential user base, understand what these groups want from their public library, anticipate emerging needs, and make services and collections as accessible as possible. Needs assessments done by almost every public library finds that people want more books and resources, better hours, more and faster computers, and more parking (where public transportation is not available). More specific areas of need identified refer to serving people at all ages and stages of life as well as individuals and groups with special needs and institutions within the wider community network.^[4] Because resources are always scarce, libraries have to carefully collect and analyze data that clearly identifies the needs and assists the library in putting them in a priority order that makes best sense in that particular community. Sometimes needs are deliberately underserved or not served at all because of resource

constraints or because another community agency has been able or has the mandate to address the needs. For example in a new community with many children, pre-school programs and materials might be the library’s highest priority, where a high seniors population would dictate different priorities in another community. In some locales assessing needs can be a simple enquiry to the community. In other instances, public libraries are using a wide range of research and information-seeking strategies to develop both qualitative and quantitative approaches to studying and planning for their community needs. This approach moves libraries away from strictly quantitative standards which may be inappropriate for an individual community. Quantitative standards may not be relevant to services or evaluation of their effectiveness yet still be politically important in the effort to raise or maintain revenue.

Once users needs have been identified, public libraries then have to plan to provide services to satisfy those needs often while eliminating or narrowing other areas of activity. In general the services include: loans of books and other media, provision of materials for use in the library, reference and information services, access to the public Internet and related technology, readers advisory services, information about the community, user education—in particular literacy including computer literacy, outreach services to those unable to physically access the library facilities, and a selection of materials, programs, and events for various age and ability groups.

Materials and Services for Children

Materials and services for children are a mainstay of the modern public library in all parts of the world. Libraries have embraced the role of helping children discover and experience the joy of reading and adapting to other media. They also work intensively with parents and caregivers as co-conspirators in the development of a literate youth population. Responding to these trends in 2008, the Danish Library Authority issued a report which recommended radical changes in the approach to library services for children. It is an encapsulation of how children’s library services are responding to the complex digital world in which so many of our children live. The recommendations (translated from the Danish) take the form of 10 commandments and include: 1) New competencies create new activities in the library; 2) The library space must create surprise and inspiration; 3) Libraries must develop their net services (libraries create new frameworks and facilities by exploiting social technologies and using staff as hosts and resources in virtual networks for children); 4) Children play in the library; 5) The library gives children reading experiences and reading skills; 6) Create assets in new forms of cooperation between the school library and the public library; 7) The library creates community feeling—also for those

outside (meaning children with special needs, handicapped, socially vulnerable and children with ethnic backgrounds other than Danish); 8) The library supports learning and cultural development; 9) The library must reach out to children; and 10) The library's management focuses on children.^[12]

The range of programming for children in public libraries is rich with examples which illustrate the new Danish thinking. In Bucharest, Rumania, the city library offers summer programs, run by volunteers, aimed at children from 11 to 14 whose parents are at work. In Singapore, more than 40 children's libraries for children under 10 have been established in cooperation with grass roots organizations. These have over the years made way for larger public libraries complete with library services for children. During the war in Croatia, a step-by-step reading program was organized in Zagreb public library to aid the psycho-social recovery of children and adolescents through reading and literacy.^[4] In Ottawa, Canada, the public library provides back-packs of high quality and popular children's materials for busy parents to grab on their way out the door of the library. In Fujian, China, the Xiamen Public Children's Library has established the Apple Tree Library aiming to promote English language competency. One of the newest service concepts is seen in the Library of 100 Talents in Heerhugowaard, the Netherlands. "In this library, the children are the librarians. The organization of the library reflects the way that children use information, create new contexts, and share this with other children. More than 250 children participated in the library's design; the multimedia collection is presented in a number of 'islands' of things to do: nature, the living room, me and the world and dreams." The Library is a successful attempt to move the library to be both linguistic and nonlinguistic in the discovery and learning experiences it offers its young clients.^[13] Increasingly public

libraries are creating early childhood learning and literacy centers in their children's departments. For instance these are being developed by the Toronto Public Library as substantial areas, as branches are renovated and have been trademarked as KidsStop™ (Fig. 2). This approach is built on research that proves that the higher the literacy rates in children and the earlier children are exposed to a positive reading and learning environment, the better chances they have for positive life-outcomes in such key areas as health, employment, and participation in the justice system.^[14,15]

Materials and Services for Teens

Materials and services for teens have always been an important part of public library offerings. However, now many public libraries, such as the Jacksonville Public Library in Florida, United States, are placing increasing focus on the creation of separate physical teen spaces or teen zones (Fig. 3), specialized materials both print and digital, teen programming, and in particular the introduction of video/computer gaming as a form of both teaching, learning and building literacy and new social skills in young people.

In Hamburg, Germany, young adults help to select and buy media stock for the young adults' library in a project called EXIT. They select media reflecting their own cultural background and have organized and gained sponsorship for their own Internet café. In Singapore, a library aimed at people years 18–35 was established in the heart of the shopping area. Focus groups helped to define the profile of the collection and design the "library@orchard" which has been immensely popular and received 1.4 million visits per year. (It is currently closed for relocation in 2010.) In Queensland, Australia, public library staff

receive specialist training in working with young adults. The training covers customer service, programming ideas, and how to run teenage advisory groups and homework clubs.

Services and Materials for Adults

Services and materials for adults in public libraries support lifelong learning, literacy, employment, health, recreation and reading, small business, literature and culture, settlement services, citizenship, civic engagement, and the strengthening of democracy. Again it is critical that the local library carefully analyze its community to determine the best place to invest limited resources and identify where networking with other institutions can leverage more service offerings for their clients.

Many public libraries support lifelong learning working with schools and other educational institutions to help students in both formal and informal educational settings. This often takes the form of support for literacy by supplying resources and facilities for students and trainers or actually being the primary provider of literacy programs themselves. In other libraries it means supporting distance education programs or providing invigilation services. For instance, the South Dublin County Library Service, Ireland provides self-learning facilities for adults, including computer-based learning and audio- and video-based language-learning materials.^[4] The new central library in Salt Lake City welcomes all comers providing classes in English as a second language, meditation and Braille. Organizations such as Weight Watchers, to the Royal Court of the Golden Spike Empire, to No More Homeless Pets, have used the building for their meetings. Other groups such as Single Moms, the Utah Socialists and a group that reads to their dogs are also users of the library.^[16]

Services for New-Comers, Immigrants, the Socially Excluded and Diverse Populations

Service for newcomers is not a new offering for many public libraries but increasing globalization and movement among countries has made this a new or higher service imperative for many public libraries particularly in countries that are experiencing high levels of immigration such as the United States, Canada, Australia, Great Britain, the Scandinavian and Benelux countries, and Germany. In the United States, the immigrant population has grown to 33.5 million or 12% of the population.^[17] In Canada, according to the 2006 Census, one in five (19.8%) residents were born outside of Canada. Most newcomers settle in large urban centers. For example the Canadian metropolitan area of greater Toronto has a population of more than 5 million of which 45% were born in another country.^[18]

Services for immigrants particularly in North America go back to library philanthropist Andrew Carnegie's desire to fund libraries as a place for immigrant self-education. For example, in 1910 the Minneapolis (United States) Public Library created a reading room for the unemployed most of whom were immigrants and in 1915 the Hibbing, Minnesota (United States) Public Library operated a library bus that served a clientele which included populations of Finnish, Irish, and Serbian immigrants.^[19] Currently services range from collections in multiple languages, bilingual or multilingual staff, multilingual and newcomer sections of library Web sites (with both text and video) as well as library publications, computer services and training for newcomers often in a variety of languages, language and literacy training programs, multilingual conversation programs and book clubs, foreign language and bilingual workshops including book groups and literacy tutoring, heritage day celebrations,

specialized outreach and program partnerships with a wide range of ethno-cultural organizations. Some examples include:

- In Nuremberg, Germany, there is a significant Russian immigrant population. The library provides print and audio visual material in Russian, language courses and books about Germany, specialized materials about career training and re-qualification. It also employs Russian speaking public service and technical services staff.^[20]
- In Ottawa, Canada, the library Web site features a welcome to the library video in 17 different languages to supplement library settlement services in 9 of the 33 branch locations.^[21]
- Public libraries also develop programs to foster inter-cultural harmony and understanding. In the public library in Malmo, Sweden and in some libraries in the United Kingdom and Canada, patrons can use the “living library” to borrow a living person for a 30 min chat. Two of the most popular individuals “borrowed” are immigrants such as a veiled Muslim woman and an imam.
- In Denmark, the growing number of immigrants and refugees is a relatively new experience for public libraries.^[22] A major public library response published by the Danish Library Centre for Integration has been the creation, maintenance, and updating of FINFO a Web portal that gives local, national, and global information in the 11 most frequently used languages in Denmark.^[23] The purpose of FINFO is to support integration of the minorities into Danish society.^[24]
- In Queens, New York (United States), the public library has partnered with the Mayor’s Office for Immigrant Affairs to provide computers and assistance for customers who wish to fill out the application for the Diversity (Green Card) Visa Lottery.

Susan Burke’s research on public library resources used by immigrant households^[25] found that newcomers were “less likely to use non-English language materials, attend library programs, for help finding a job or to search for information than the literature suggests. They were most likely to borrow books, tapes, and CDs, not specifically those in languages other than English, to pursue hobbies and entertainment, and use the library for educational pursuits.” This suggests that the public library needs to carefully evaluate their newcomer services to ensure that they are reaching and meeting the needs of that specific target group.

In 2008, The Intergovernmental Council for UNESCO’s “Information for All Programme,” endorsed the IFLA/UNESCO Multicultural Library Manifesto.^[26] This is a useful tool for public libraries to work with multicultural issues on the local, national, and international level. The three major pillars of the Manifesto states

that: libraries can play an important role in our globalized and multicultural world; respect for the diversity of cultures, tolerance, dialogue, and cooperation are among the best guarantees for international peace and security; and libraries promote and preserve cultural and linguistic heritage. This new Manifesto complements the IFLA/UNESCO Public Library Manifesto, the IFLA/UNESCO School Library Manifesto and the IFLA Internet Manifesto. It is also supported by the Guidelines for Libraries Serving Multicultural Populations.^[27]

Services to diverse populations also take the form of many types of outreach programs including services to prisons, homeless and battered spouse shelters and residences, low-income communities, hospitals and persons confined to their homes for reasons of age or infirmity or both.^[28] Libraries also provide on-site shelter and support for homeless and indigent populations and are often partners with social service agencies. This is particularly the case in large urban central libraries and branches in inner-city areas. Other libraries have developed specialties at specific branches which could include African-American history, genealogy and Aboriginal author, and oral history programs. Four major public libraries in Canada have recently concluded a multiyear project and produced a tool-kit called “Working Together” to assist libraries in reaching out to marginalized populations. More sophisticated market segmentation of communities is also revealing that the upwardly mobile middle and upper middle classes are also often underserved.^[29]

Resource Collections

Collections are at the heart of all public libraries. They are never big enough or good enough. In 2008, there are several key external and internal issues and trends that are affecting collection management and the ability to provide client-focused service. The first of these is population including growth, continuing shifts from rural to urban centers and changing demographics. Demographic shifts, combined with limited budget increases, the relentless emergence of new formats and the increasing use of library collections mean that there could be fewer library materials for future users. In many developed countries like Germany and Sweden, an aging population, falling birth rates and new patterns of immigration are increasingly placing new and different demands on public library collections.

News media and many forms of entertainment continue to influence sales and demand for particular titles in a wide range of formats. Curiously, some libraries report that while there is an insatiable demand for new titles there is also sustaining customer interest in older publications at a time when publishers trend toward maintaining limited backlists. This can be attributed to the “long tail” effect where increased aggregation of titles and speedy access to the databases leads the library user away from best sellers

and to the rest of what is available further afield.^[30] It could also reflect the desire to find more, older works by authors (particularly novels) whose new or current works they have just discovered.

Social networks such as Facebook, Myspace, and Flickr are also having an influence on collections and services. Library customers of all ages, but particularly the young, use the Internet to stay tuned and connected. The February 19, 2007 issue of *Publishers Weekly* noted that,

With kids now spending more time on the computer than they do in front of the TV or the printed page, publishers are trying to reach them where they live through online marketing campaigns, utilizing blogs, podcasts, instant messaging, video-sharing and social networking sites like MySpace which is a regular destination for 55% of teens according to a recent PEW survey.^[31]

The history of public libraries shows that libraries have always, since their early days provided media in all its multiple formats. (p. 1)^[32] Today, there is increasingly rapid change in all audio and visual formats. Library budgets must allocate larger percentages to film, television, and other performances available on an increasing variety of media formats, and the selection is becoming broader. In addition, DVD collections are increasingly reflecting libraries' expansion to world languages to better service newcomers to the community. The DVD has replaced the video as the format of choice for library users. Many library leaders and collection specialists believe that the DVD will soon give way to a faster, more compressed digital format.

Libraries are also registering usage declines in certain other and earlier formats. Many libraries have completely withdrawn their video-cassette collections and book tape collections are no longer being developed. For now CDs have become the format of choice for audio visual resources within the marketplace and within the library. This includes book CDs, downloadable audio books playable on computers, MP3 devices, and IPODs. In public libraries this is being expanded to music and video products. Digital rights management is coming more to the fore as producers work through the challenges of downloading and file sharing. Specialized resources for the print disabled are increasingly provided to libraries and clients using the Digital Accessible Information System (DAISY) format.

The growing range of resources in digital form is increasingly extending the Library's reach into the community providing registered customers with more convenient access to information and recreational materials. The majority of library catalogs have long been available via remote access on an almost 24/7 basis. Many libraries anticipate that electronic media will eventually become the norm for the delivery of spoken word and video

resources to customers and that these e-resources will replace books on tape, books CDs, MPS3 audio books, videos and DVDs. Electronic media is predicted to be the format of choice for language learning, test preparation, and career planning. E-book devices are becoming cheaper and easier to use. E-learning will increase. Best of all, unlike physical items, Web-based electronic products require no physical shelf space.

Public libraries are increasingly treating their collections of e-resources as another branch. Many public libraries subscribe to dozens if not hundreds of electronic databases. These are often provided through consortia or national, state, regional, or provincial licensing schemes. Library Web sites are being redesigned to draw the user in and keep them there. This is evident in the Vaughan Public Library's teen zone,^[33] the Ottawa Public Library's Kids Site^[21] and the Cleveland Public Library's island in Second Life virtual reality.^[34] Other e-initiatives include online book clubs, online training, offerings such as NewspaperDirect PressDisplay which provides same day access to more than 230 newspapers from around the world with the text in the language of origin. As more vendors respond to new public needs, such digital resources as Home Repair Reference Centre, Small Engine Repair are becoming increasingly available in digital form.

The continuing migration from print to digital, especially in the area of reference tools, means that public libraries' print reference collections are now declining significantly particularly. In many library branches the print reference collection takes up no more than a few shelves.

However there is still the pull of print as Mattern states in *The New Downtown Library: Designing with Communities*:

There is a materiality to particular media and artifacts and experiences that cannot be reproduced in a digital environment. There must be a place for this material knowledge—a place where people can feel the heft of a book, smell the ink of a newly printed magazine, turn gingerly the brittle pages of a worn manuscript, or dig through collections of yellowed historical photographs. (p. ix)^[32]

And of course there must be a place where someone can go to get a book and settle in to read if she so desires.

Human Resources

The four pillars of public library services are books, buildings, bytes and bodies or in common parlance, materials, buildings, technology and staff, and other elements of human capital. The human resource element of the budget is usually the largest (between 60% and 80%+). Staff are required to lead, direct, manage, and plan for the future of the service, advocate for funding and resources, collect

and organize the services and programs, provide direct services such as circulation and information services, function as the intermediary between the users and the resources and technology available, reach out to the unserved, develop service partnerships, work with professional colleagues of other systems and associations to plan for, leverage and advocate for service and funding improvements over larger units of service and governments. This is largely driven by the desire to provide as equitable a service to as many citizens as possible.

Categories of staff found in public libraries normally include directors and managers, qualified librarians, library assistants, technical staff and/or paraprofessionals, specialist staff, and a wide variety of support staff. Employees are either full time or part time in a variety of permanent, term, temporary, or casual status categories. Most public library workers are not unionized but most workers in large and/or urban library systems are either unionized or part of a staff association.

The public library workforce is currently under severe pressure. As public library service has become more complex so have the requirements for the skills and qualities of those working in them. Library service now requires confident, outgoing individuals at all levels of the organization who can communicate effectively with patrons, community groups, politicians, and fellow workers; understand and interpret their needs; and work effectively within a climate of cultural, ethnic and intergenerational diversity. Increasingly library staff are required to be innovative, flexible, entrepreneurial, imaginative and visionary, work as part of a team, and be able to respond to rapid change in both methods of service and professional practice. They are asked to be knowledgeable about building and maintaining facilities, computers, printers, photocopiers, scanners, digital environments, and social software while simultaneously developing and applying skills that some might see more appropriately assigned to a psychologist or social worker. And they work in institutions where only a few years ago the primary (but not only) reward system was too often driven by following the rules and getting the books back on the shelves. All public libraries are being asked to do more with less and to exploit technology to become more efficient and effective.

Libraries, like most public service institutions are now being charged with developing their workforce to reflect the community it services in terms of ethno-cultural and linguistic diversity. This is happening at a time when the library workforce is aging, there are insufficient recruits to fill all the vacancies, wages are not always competitive, there is increasing difficulty in attracting professional librarians into the managerial ranks and an often blurred distinction between professionals and paraprofessionals.

One of the major challenges of the public library director is to provide an environment where staff have continuing opportunities for growth and development particularly in the areas of technology, networking, supervision,

management and leadership skills development, budgeting and opportunities for special projects that provide an appropriate level of professional engagement. The IFLA Guidelines suggests that between 0.5% and 1.0% of the total library budget should be designated for training.^[4]

Marketing the Service

Almost every public library needs assessments including the recent OCLC report on perceptions of libraries reveal that regardless of what new and innovative offerings libraries provide, the vast majority of users and potential users think of their public library as a place to get books and that they are unaware of the vast resources and connections available to them.^[10] At the same time the *Long Overdue* study on public and leadership attitudes toward libraries reported that in America at least, people believe that their libraries are an important part of a healthy community; that libraries spend money well; that libraries need to provide information free of charge; that they expect a good supply of current books, reference materials, convenient hours, knowledgeable staff, and spaces for children and teenagers. Libraries are supported and given high marks for services by users but most users are unaware of the needs and pressures that libraries face in maintaining these services.^[11] This was reinforced by the OCLC study *From Funding to Awareness* which reported that for many public libraries the need to grow awareness and mindshare is intensifying^[35] as annual operating budgets fail to keep pace with the services and resources needed to meet the library's mission. The study reinforced that this lack of awareness is leading to reduced budgets staff, hours, and services in spite of increased circulation, library visits, and Internet use. The findings suggested that there is sufficient but latent support for increased library funding but that a large-scale library support campaign using brand segmentation and marketing is urgently needed. A further finding identified that the majority of elected officials while appreciative of the values and services of the public library and librarians are reluctant to support a tax increase for local services, including the public library.^[35]

The IFLA Guidelines for public libraries state that libraries must continually promote their offerings to the public.^[4] This requires a strategic vision plus communications, marketing and promotion policy, plans and strategies to tell the library story and engage both the user and potential user. Libraries worldwide have used an array of strategies including Web sites, print, electronic, and commercial media; displays and exhibits; friends of libraries and library foundations; celebrations of events, individuals and milestones; public speaking events; targeted activities to engage elected officials at the local, state and national levels; special campaigns such as one-city/one-book, library sign-ups and the use of well-known persons

such as actors, astronauts, and authors to help link the library to the community.

Often staff, trustees (where they exist) and library friends and advocates receive special communications and media training to help them deliver the library message in a convincing and professional way to councils, groups, individuals, and potential funders. This activity is intensified at budget time but the most successful libraries employ these strategies on an ongoing basis. However, all studies indicate that these efforts are still not sufficient to get the message across or sustain the support needed.

Library as Place

Notwithstanding the above, public libraries continue to be regarded by many as relevant, vital public institutions (whether or not survey respondents use them). Now new forces are requiring and shaping library design and drawing users back. These forces include the proliferation of new media, the integration of non-media activities, new hours, the introduction of commercial elements such as coffee houses and other retail outlets, and the new view of libraries as economic generators as well as hubs of urban revitalization.

The library building is as much a part of public library service as the resources and the staff within. Increasingly, in many parts of the world the public library is becoming a third community place—apart from home and school or home and church—a community gathering place where there is no pressure to buy, consume, or perform as well as a place that provides encouragement for exploration, discovery, connection, and civility. Library space is becoming more and more important when so many other activities and services are increasingly offered in virtual form. From China, to Columbia to Australia to Slovenia to South Africa, new and beautifully designed libraries are becoming facilities of service, community congregation and human engagement, and a focus of civic pride.

When planning a library facility, the library staff, governing and funding bodies consider provisions for the range of functions of the library, the size of the library, designated spaces or zones, accessibility, way finding, ambience, information and computer technology, food services, meeting room space, heritage, genealogy, and archival functions.^[4] Increasingly attention has to be paid to environmental sustainability and adhering to LEED (Leadership in Energy and Environmental Design) or equivalent standards, proximity or integration with public transportation hubs, group project and study space, catering facilities, prayer, meditation or quiet rooms, archival and heritage functional space, special and/or flexible spaces for groups such as newcomers, teens, children and seniors, and services for the alternately abled. In addition, the general public is increasingly being invited to participate in the planning and funding of these important

civic spaces which they pay for through their tax dollars or their participation in fund-raising and advocacy efforts.

At the same time, the ever adaptable public library still brings service to the people in many other forms. And so the concept of library as place also includes, bookmobiles, donkey libraries in Zimbabwe, camel library services in Kenya, subway and garden market library kiosks in Chile and floating libraries or library book boats in such diverse countries as Thailand and Norway. And making a debut are DIY (do-it-yourself) electronic kiosks libraries such as those in Roanoke, Virginia (United States), which are being located in community centers, transit stations, and commercial shopping malls as a way of extending service and keeping costs down in tight economic times. In these types of facilities, library staff are sometimes available through remote electronic access and the kiosks are restocked by non-public staff. But, everything that comes around, goes around. Allen Lane, founder of Penguin paperbacks, first established a “Penguincubator” in the mid-1930s in London, England—a slot machine that dispensed his paperbacks for a small fee of six pence—the price of a packet of cigarettes.^[36]

In *The Library as Place*, Buschman and Leckie provide a collection of 14 original articles documenting the library as a place of immense cultural, symbolic, and intellectual meaning for users whether they are seeking pleasure, scholarship, or both.^[37]

New Central Libraries

In the last 20 years, the building of significant new iconic central and/or national libraries has surged across the globe reinforcing the concept of third place beyond home, school, and work. The result has been such striking facilities as the Seattle Public Library by Rem Koolhaas (Fig. 4), the new Singapore National Library (Fig. 5), the Grande Bibliothèque du Québec in Montreal by John Patkau (Fig. 6) as well as his renovation of the Winnipeg Public Library (Fig. 7), the Mitterand Library in Paris, the Amsterdam Public Library by Jo Coenen (Fig. 8), the Jacksonville Central Library in northern Florida, the Vancouver (Fig. 9) and Salt Lake City (Fig. 10) public libraries by Moshe Safdie and the Shanghai Library (Fig. 11) which with 83,000 m² is one of the 10 largest libraries in the world. In many situations including Seattle, Vancouver, Singapore, Jacksonville, and the Harold Washington Library Center in Chicago, the building of the central library has been part of a major redevelopment of existing branch libraries as well as the introduction of new service points throughout the city.

In building these massive facilities, library planners are having to balance the need for access while ensuring security, the provision of both public and commercial space, providing universal access within budget constraints, and an economical and efficient building.

Notwithstanding the many significant central facilities that have been erected, the approval and funding process is often very difficult, challenging and always political. Many citizens, whether they are users or not, fear the

reduction or elimination of beloved branch facilities in favor of a large downtown library. Sometimes the library capital scheme is bundled with other less attractive public sector projects. Some citizens and elected officials have concerns about the relevance of a large, expensive downtown facility in an increasingly digitized, decentralized, and privatized culture.^[32] And a new downtown facility, indeed the whole library system always has to compete with other public service priorities such as police, schools, fire, and public housing. In many American cities, a major library project has to be put to a public vote. Once political and public approval is obtained most cities use an architectural competition to select its design team however the use of public-private partnerships is increasing and this sometimes affects the selection of architectural and design professionals. New central libraries must always be integrated into the life of the community whether there is a vibrant downtown to be nourished or the facility is part of a broader effort to revive life downtown.

MEASUREMENT AND EVALUATION OF PUBLIC LIBRARIES

Performance Measurement

Performance measurement has been used in libraries for many years. Originally libraries, library organizations and legislative bodies developed state, national, and international standards. In 1973 and 1977 IFLA issued *Standards for Public Libraries* which contained a range of quantitative standards including the recommended size of collection, size of administrative unit, opening hours, staffing levels and building standards. But beginning in 1986, IFLA took a different approach recognizing that worldwide resources and needs differed so significantly that there could be no common standards for service. Still

libraries, especially those in developing countries repeatedly asked for some type of levels or standards to assist them in their planning and development and in particular supporting the concepts of that public library services are provided without charge and without censorship. Therefore in developing the latest Guidelines for Development the planners decided to produce a set of guidelines with some standards that could be relevant at various points in a library's development, and to leave the development of specialist areas to the special sections of IFLA.^[4]

Measuring the performance of libraries is increasingly a combination of quantitative and qualitative approaches. Measurement normally begins with identifying performance indicators to measure the resource input, as well as outputs or what is achieved as a result of the activity or service being carried out. For example, a lending service requires books and other resources, staff, space, delivery services, computers, and other equipment that can all be assigned a numeric and financial value. The output of this service could be described as the total number of books circulated, the cost per capita expended on resources, the number of first time check-outs and the number of renewals, the number of card-holders or users per capita, etc. Inputs and outputs are usually compared within an institution to determine changes over time and how effective the service is. They can also be benchmarked with results from other libraries of similar size and characteristics. These statistics are often required as a condition of funding from a parent body. They are often used to illustrate the role of the library in the community or to make a case for increased funding and support. State and national agencies and organizations usually provide statistical gathering support to individual libraries.

Increasingly libraries are being called on to provide detailed reports and statistics that present more and more qualitative assessment of library performance and to measure the outcomes or impact that a library has in addition to inputs and outputs. Some of the major qualitative indicators used by public libraries include results of user satisfaction surveys. For instance, many Canadian public libraries hire independent firms and/or use computerized survey instruments to obtain occasional or ongoing customer satisfaction ratings. On a municipal level, the city government often includes libraries in surveys of citizen satisfaction with a variety of municipal services. On a national level in Canada the "Citizens First" survey conducted every 4 years, measures a wide range of federal, provincial, and municipal services in both the private and public sectors.^[38] The goal is to track improvement overtime. Repeatedly, public libraries have topped the list in service satisfaction usually exceeded only by the fire departments. Other quantitative measures have included prizes, honors, and awards won by the library and its staff and board; results of the library in citywide assessments of city departments making effective use of technology; the role of the library in scoring a city as a learning or smart

city. So important is the concept of consumer-centric service that one library administrator has even gone so far as to propose counting customer smiles per hour (on an occasional basis) as a proxy measure for customer satisfaction.

A new planning, measurement and political tool called *A Library's Contribution to Your Community* published by the Southern Ontario Library Services in Canada helps library boards and administrators measure their library's social and economic contributions to their community and society. It guides users through the development of a contribution strategy including selecting relevant library outcomes from among six contributions and 20 benefits through collecting and interpreting data and constructing the argument. The benefits include elements such as life-long learning, support for individuals in the education system, reading and numeracy skills, English as a second language, cultural awareness, information services to local business, tourism, career development, and search for employment. The contributions identified include: education and learning, literacy, culture and recreation, business and the economy, personal support and community development.^[39] Rubin's publication *Demonstrating Results: Using Outcome Measurement in Your Library* (2006) is the sixth in a series of "results" publications that provide an integrated approach to planning, resource allocation outcome measurement and excellence that is defined locally rather than through a series of universal or national or state standards.^[40]

The Value of Public Libraries

Identifying the economic role that public libraries play in communities is becoming more and more crucial to the funding, support and existence of libraries. Library authorities are now using tools from economics and political science to demonstrate, both qualitatively and quantitatively, the value of the public library to the community it serves.^[41] While many of the studies are American, contributions also come from Canada, Hungary, and Great Britain. One of the most well-known economic impact studies is *The Seattle Public Library Central Library: Economic Benefits Assessment 2007*. The study included surveys and interviews with users, visitors, business owners, tourism operators and confirmed that the new central library which opened in 2004, was functioning as a highly effective gateway to public space and tourist destination and that it was a significant contributor to Seattle's economy, a catalyst for downtown revitalization and development and a new icon for the city. In particular, the study found that the new central library was associated with \$16 million in net new spending outside of the library in its first year of operations.^[42]

Increasingly citizens and political leaders are seeing that not only can new central libraries, like those in Vancouver, Denver, Vienna, Turin, Amsterdam, and Shanghai, demonstrate civic commitment to information, ideas, knowledge, and growth, but they can also be drivers of

economic vitality, contribute to community character and liveability, and enhance the image and identity of the whole city area.

The seminal study by Griffith, King, and Harrington, *Taxpayer Return on Investment in Florida Public Libraries*, used a variety of approaches to assess taxpayer return on investment (ROI) in the state of Florida. The study showed substantial returns exceeding taxpayer investment and that over all public libraries return U.S. \$6.75 for every U.S. \$1.00 invested from all sources (federal, state, local, and other) and that the total impact of Florida's public libraries on the state economy was \$6 billion/year. This impact included non-library job creation, increased gross regional product and income or wage increases.^[43] Similarly, one of the earliest ROI studies of the St. Louis Public Library concluded that the users received \$4.38 in benefits for every tax dollar spent.^[44] A variety of other studies indicate that an overall ROI figure of between 3 and 6 is likely to result although there can be significant variation depending on the key factors relating to community needs, the actual services provided by the library and the evaluation methods used.

TRENDS AND CHALLENGES IN PUBLIC LIBRARY SERVICE

In 2008, in spite of dire predictions by some about the demise of the public library and the stiff competition offered by digitization in particular Google and the Internet, students and others are continuing to use public libraries in greater and greater numbers both physically and virtually. And with the near collapse of the global economic framework in the fall of 2008, it is likely, based on past experience in economic downturns, that public libraries will be busier than ever for the next few years.

Virtual Use

More and more frequently, patrons are accessing public-library services from remote locations. In a recent survey, more than half of American adults said they had visited a local public library in the past 12 months. And a survey conducted in 2006 by KRC Research and Consulting reported that 12% of the 1000 people interviewed "visited" their local library by phone and 12% visited by computer. Among those who visited by phone or computer 41% did so to renew a borrowed item, 48% to consult a librarian for help, 45% to check the library's online catalog and 42% to use other resources on the library's Web page.^[45]

Gaming in Public Libraries

A new phenomenon in many public libraries is the introduction of computer or video gaming. This type of youth programming featuring such games as Guitar Hero and

Dance, Dance Revolution, was first initiated to attract teen-aged clients born in the age of the Internet and quite comfortable with conducting much of their lives in the virtual world. While this type of activity in libraries is not without its detractors, computer or video gaming is now used increasingly in intergenerational programming in libraries and other institutions such as seniors centers and long-term care facilities. In June 2008, the Verizon Foundation, the philanthropic arm of Verizon Communications, announced a \$1 million grant to the American Library Association to study how gaming can be used to improve problem-solving and literacy skills.^[46] Nicholson's study of the role of gaming states that 77% of libraries contacted have formal gaming programs ranging from video games to board games and other more traditional games like puzzles. Gaming he suggests, is a form of story telling and an activity that captures the imagination and creates a comfortable and inviting environment to encourage participants of all ages to enjoy spending time in the library.^[47]

Technology and Access in the Public Library

Nothing has impacted on the role of the public library in the community more significantly in the last 20 years than the introduction of free public Internet access. This new service has changed staff roles and training, allocation of funding, design of facilities, and debates about intellectual freedom and censorship. Since 2006 the American Library Association has issued two major studies on public library funding and technology. Findings can apply to public libraries across the globe. The key highlights conclude that libraries play a strategic role in providing free access to networked information and related telecommunications services and that demand is increasing particularly for access to e-government, lifelong learning, and employment seeking. But the studies also document that funding for public technology access is volatile especially for small libraries; staffing levels to support access is not keeping pace with patron demand; the need for increased bandwidth is becoming critical given the types of information patrons are seeking; library online services (e.g., homework resources, e-books, audio and video, gaming) are growing dramatically but have corresponding impact on the library's public services and technology infrastructure. And finally, the reports' findings include that many library buildings, already inadequate in terms of space and infrastructure cannot support additional public access computers and technology infrastructure.^[48]

This situation is in the context of the major report findings including: funding remains flat for many public libraries; staffing is at a standstill (inadequate staffing topped the list of library concerns); staff training needs outpace supply; ICT (information and communications technology) support is lagging whether supplied internally by the library or externally by another level of government; and connection speed is increasingly insufficient.

Internet services show double digit growth in the availability of a range of resources in five key online areas: audio content, video content, homework help, e-book availability, and digitized special collections. Buildings and infrastructure are being further stretched given that the majority of library buildings are 25–50 years old and 40% of library buildings are estimated to be in only fair to poor condition. While online services are growing everywhere and libraries are facing a growing strain to keep up with user demand for public access computing.

In keeping with the need to actively involve the user in public library service, more and more libraries are looking at and experimenting with using social software such as blogs, RRS feeds (really simple syndication), wikis, photo-sharing applications, chat reference, and electronic discussion forums. This is an example of Library 2.0, a term that is used to characterize the strategies that libraries should use to position themselves as relevant in a digital future.^[49]

Bibliocommons is a new social discovery tool being developed for libraries by a Toronto (Canada) based company with support from two Canadian provinces and with strong potential to replace all user-facing functionality of the library online catalog and allowing for faceted searching, easier user commenting and tagging. It is being created to respond to the new inter-active world and to provide a platform for richer connections between users, content, and community. This is one development trend to watch closely.^[50]

Public Library Funding

From a sample of 29 countries, the OCLC 2003 Environmental Scan estimated that library spending worldwide is approximately \$31 billion/annum. This figure is approximate and likely understated as many countries such as China and Brazil do not regularly collect or report library expenditures.^[16] While usage rates both physical and electronic continue to rise in public libraries, in general, financial support lags.^[43] In most countries the majority of funding for public library services comes from the local level of government. Depending on the legal framework for library services, senior levels of government provide sustaining funding often to support resource development and sharing, and well as special grant funding often to stimulate and strengthen specific service responses e.g., literacy, service to business, public Internet access.

Without suitable and consistent levels of funding over the long-term, it is not possible to develop policies for service provision and make the most effective use of available resources.^[4] Inadequate funding can result in a new library building without adequate funds to maintain it; collections with insufficient funds for new materials; computer systems and equipment not being replaced or upgraded. Most public libraries rely primarily on taxation at the local level. Additional sources of income include

donations from private funding bodies or individuals; commercial activities e.g., book-sales; user fees; special related services e.g., photocopying and computer printing; sponsorships from and partnerships with other organizations e.g., Citizenship and Health departments; and lottery funds. Increasingly libraries are establishing their own separate charitable foundations to professionalize their fund-raising efforts and establishing formal friends of the library groups to both raise money and advocate for better funding from the parent body. Finally, to stretch the available funds most public libraries belong to one or more consortia or resource sharing schemes.

One of librarianship's oldest beliefs is that access to information should be free as a basic right of citizenship. The *IFLA/UNESCO Guidelines* state: "the public library shall in principle be free of charge."^[4] Library membership in most countries is free with some special and supplementary services having associated fees. However in some countries small membership fees are permitted, e.g., Singapore; the province of Alberta, Canada. Many libraries, while not charging for membership, have found creative ways of increasing revenue with a variety of charges to users for such services as faster access to best sellers, printing and photocopying, replacement of lost membership fees, some types of business information services. A number of researchers such as Butterworth have demonstrated that many of these types of fees, but not all, can have a negative impact on borrowing and overall usage of the library, especially if they are combined with a real or perceived decline in service.^[51] However, there is also evidence to indicate that it may not be the amount of money that libraries can raise with fees for service but the fact that they are trying to contribute to the operation of the library and easing the load on the primary tax base that is important.

Usually and especially in times of fiscal recession and constraint which is the situation in many parts of the world at the time of this writing, libraries are viewed as soft services and as targets for budget reductions particularly as replace funders and legislators may believe that the public library could be replaced by Google.

The 2008 OCLC report (*From Awareness to Funding*) studied funding to public libraries in the United States. It documented that while local taxpayers in the United States provided over U.S. \$9 billion in 2004 to support the operations of their public libraries, in general library annual operating funds are not keeping pace with services and operations to meet their mission and that in 2005 over one-third of U.S. public libraries were operating with budgets that are declining and that many more were operating with budgets that are slightly ahead of inflation but significantly behind the current inflation rates for employee benefits, energy and materials. The result is that many libraries are being forced to reduce staff, cut hours, and reduce community services. The study demonstrated that it was possible to apply the latest marketing and advocacy

techniques so successfully used in other venues to create funding awareness, drive action and ultimately increase funding for public libraries; that it was possible to position libraries along other critical hard services like fire and police; and that a national campaign could make a difference in funding. The study's findings strongly suggest that there is sufficient, but latent support for increased funding among the voting public in America. The study further suggested that the funding situation will not self-correct unless there is a major campaign to communicate the value of the public library to the public to funding sources to ensure they are considered for funding. This includes building market segmentation; identifying the drivers of library funding; understanding attitudes toward libraries and library funding among the most likely supporters and creating messaging to motivate the most likely supporters to action. The idea is that this would result in the creation of a brand which would make the library relevant for the twenty-first century; instill a sense of urgency and activate a community conversation about how the library is a vital part of the community's infrastructure and future. One of the most important findings was that positive perceptions of the librarian are highly related to support and that passionate librarians who are involved in the community make a major difference to a voter's willingness to fund the public library.^[33]

In 2007, the American Library Association and the Bill and Melinda Gates Foundation joined forces to study public library funding and with particular emphasis on access to technology. The study revealed that public library infrastructure (staffing, space, and bandwidth) are stretched to capacity. Almost 73% of libraries reported that are the only source of free access to computers and the Internet in their communities; the funding sources to support this access is volatile; staffing levels are not keeping pace with patron demand and, while many libraries reported increased connection speeds to support use, the vast majority reported their wireless and desktop computers share the same network thus diminishing the effective speed of access to the Internet at the workstation. The study also reported that public access Internet services (including homework resources, e-books, audio and video) grew dramatically in the year since the previous study on the same topic and that many library buildings, inadequate in terms of space and infrastructure cannot support addition public access computers and technology infrastructure. Looking at funding over a 9-year period from 1996 to 2005 revealed that the average increase in operating funds was 4% but that there are decreases in both library expenditures and a shift of expenditures away from print collections and staff to other expenditures such as technology, utilities, and building maintenance. A trend to supporting staff salaries from soft funding such as fees, finds and special grants grew. For smaller libraries the shift of local revenue away from funding telecommunications, together with a growing reliance on soft funding

sources and state and federal support for these expenditures was also documented in the survey.^[46]

CONCLUSION

The second decade of the twenty-first century will be very challenging for public libraries. The pressures will continue to come from the relentless march of technology, the competition and the opportunity of the Internet, the googlization of the world and the impact of social networking, the effects of the global recession on government and library budgets, the competition for well-trained, talented and representative staff, the demand of staff to have a balanced lifestyle, new copyright legislation, growing low literacy rates, the need to replace and redevelop aging infrastructure, the drive for libraries to become increasingly entrepreneurial while at the same time maintain a presence as an open, supportive public knowledge institution. Earlier encyclopedia articles on public libraries have all articulated the same concerns. However, public libraries have continually faced challenges of similar magnitudes and they have always come through with vitality, resiliency, and innovation. With history behind them and the support of their associations and advocates beside them they will continue do so. We are people of the book.

BIOGRAPHICAL NOTE

Barbara Clubb is the City Librarian and CEO of the Ottawa Public Library in the city of Ottawa, Ontario, Canada. Ottawa is the capital of Canada and has a population of more than 900,000.

Ms Clubb is a past president of the Canadian Library Association, past Chair of the IFLA Public Libraries Section and a current member of the IFLA Metropolitan Libraries Section Standing Committee. She is the 2009 winner of the ALA/PLA Allie Beth Martin Award for demonstrating a range and depth of knowledge about books and other materials and a distinguished ability to share that knowledge. She is also the recipient of the 2009 Outstanding Service to Librarianship awarded by the Canadian Library Association.

American Library Association, Chicago, Illinois, U.S.A.

Abstract

From its beginning in 1944 with only 1295 members, the Public Library Association (PLA), a division of the American Library Association (ALA), has grown to nearly 12,000 members today with the stated purpose “to strengthen public libraries and their contribution to the communities they serve.” This mission positions PLA to: focus its efforts on serving the needs of its members; advocate for public libraries; and commit to quality public library services that benefit the general public. Based in Chicago and housed within ALA headquarters, PLA is a member-driven organization that exists to provide a diverse program of communication, publication, advocacy, continuing education, and programming for its members and others interested in the advancement of public library service.

INTRODUCTION

From its beginning in 1944 with only 1295 members, the Public Library Association (PLA), a division of the American Library Association (ALA), has grown to nearly 12,000 members today with the stated purpose “to strengthen public libraries and their contribution to the communities they serve.” This mission positions PLA to: focus its efforts on serving the needs of its members; advocate for public libraries; and commit to quality public library services that benefit the general public. Based in Chicago and housed within ALA headquarters, PLA is a member-driven organization that exists to provide a diverse program of communication, publication, advocacy, continuing education, and programming for its members and others interested in the advancement of public library service.

OVERVIEW

The formation of the Division of Public Libraries of the ALA was approved by votes of the ALA Council in March and October 1944, following organizational meetings, filings of petitions by nearly 1200 members, and the adoption of a temporary constitution. It was decided that the purpose of the division would be to “advance public library interests and to cooperate in the promotion of library service in general.” The dues were established as 20% of the dues paid to ALA, not to exceed \$2.00. At that time the bylaws provided that “Any member of the American Library Association interested in public libraries may become a member of the Division of Public Libraries by

indicating the division and section when paying ALA dues.” (from ALA Handbook December 1, 1944).

The first PLA president was Amy Winslow, Cuyahoga County (Ohio) Library. The first executive director was Julia Wright Merrill, an ALA staff member (from the ALA Handbook, December 1, 1945, and from Festschrift prepared by PLA staff for PLA’s Fiftieth Anniversary).

At the time of its formation, PLA was composed of these eight special-interest sections:

- Adult Education
- Branch Librarians
- Business and Technology
- Lending
- Librarians of Large Public Libraries
- Order and Book Selection
- Service Librarians
- Small Libraries

Eventually, these sections evolved into the following six sections, which were in place until 1998:

- Adult Lifelong Learning Section
- Community Information Section
- Marketing of Public Library Services Section
- Metropolitan Libraries Section
- Public Library Systems Section
- Small and Medium-Sized Libraries Section

In the 1970s, public libraries were primarily planning and serving the traditional library users—educated, middle income, more women and children than men. PLA established three age-group task forces to examine goals, missions, and standards for public library services. The

focus of these task forces was on what the public needed (not what was currently offered), and on moving from quantitative to qualitative measures for effective public library services. This led to the development of the first Planning Process for Public Libraries, published by ALA in 1980. There was still a difference in needs of public libraries serving small versus large communities, but marketing of public library services and outreach services had moved into new places of interest for all PLA members.

In the mid-1980s, articles reported that only 5% of America's public libraries were using computers for circulation. Debate was underway on whether mainframes or minicomputers would be the most effective method for automating libraries, and many libraries were experiencing difficulty convincing local officials that computers were needed. By the early 1990s, the impact of computers and the Internet had begun to forge changes in public library services. The PLA officers and members debated the pros and cons of the role of public libraries on the then-new "information superhighway." Few realized that, in less than 10 years, the Internet would become an essential and "natural" aspect of everyday life as well as public library services.

By 1996, the membership of the PLA, by a vote of 1477 (yes) to 539 (no), approved proposed bylaw changes in a special election. The bylaw changes, which replaced PLA's sections with special interest "clusters," took effect with the close of the 1998 ALA Annual Conference. The new clusters organized the work of the association into three key areas:

Library services cluster: Committees within this group focus on how public libraries and librarians can improve their services for library users, including service to children, the business community, literacy services, rural community, and homeschoolers.

Library development: Committees within this group focus on the working activities in which public librarians participate in their careers, such as those involving bibliography, continuing education, library collections, technology, and similar activities.

Issues and concerns: Committees within this group focus on activities that serve the library profession as a whole, such as those reviewing legislation, intellectual freedom, and research.

PLA's Priority Concerns identified in 1991 were given as:

- Adequate funding for public libraries.
- Improved management of public libraries.
- Recognition of the importance of all library staff in providing quality public service.
- Recruitment, education, training, and compensation of public librarians.
- Effective use of technology.
- Intellectual freedom.

- Improved access to library resources.
- Effective communication with the nonlibrary world.

In 2005, PLA approved a new strategic plan that outlined four organizational goals to help further strengthen public libraries and their contribution to the communities they serve:

Advocacy and recognition: Public libraries will be recognized as the destination for a wide variety of valuable services and their funding will be a community priority.

Literate nation: PLA will be a valued partner of public library initiatives to create a nation of readers.

Staffing and recruitment: Public libraries will be recognized as exciting places to work and will be staffed by skilled professionals who are recognized as the information experts, are competitively paid, and reflect the demographics of their communities.

Training and knowledge: PLA will be nationally recognized as the leading source for continuing education opportunities for public library staff and trustees.

In 2008, PLA's membership again voted 2731 to 163 to change the organization's bylaws, effectively reshaping the structure of the organization.

PLA members were given the opportunity to discuss and debate the proposed changes at the ALA 2008 Midwinter Meeting in Philadelphia, and again at member forums held during the 2008 PLA National Conference in Minneapolis, Minnesota. Major components of the bylaws changes include a reduction in the size of the PLA board, the disbandment of the PLA executive committee, and the transition from PLA committees to Communities of Practice. Communities of Practice are virtual groups that are interest-focused and member-driven. Members can create groups, as well as morph and/or disband them at their discretion. This will allow members, many of whom are unable to travel to in-person committee meetings, to get involved with the organization and the public library issues they care about most.

ORGANIZATION

The original officers of the PLA were the chairpersons of the original eight sections, president, first vice-president, second vice-president, treasurer, and executive secretary.

Through June 2008, the officers of this association are the immediate past-president; the president; the vice-president, who serves as president-elect; and the executive director. The executive director is chosen by the executive director of the ALA with the approval of the Board of Directors of the PLA.

With the bylaws change vote of 2008, the PLA Board of Directors changes. With the exception of the officer

positions (president elect, president, past-president); and the ALA division councilor; and ALTA representative, PLA Board members are now all members-at-large. Board service is no longer tied to representing a specific Cluster of member committee. The Executive Committee has been eliminated. Through attrition, the Board will eventually be reduced in size from 24 to 12.

The new bylaws also changes board service requirements. The full Board of Directors will now meet four times a year instead of twice a year. The new meeting schedule consists of a fall board meeting held in conjunction with the ALA Executive Board meeting; a meeting held at the ALA Midwinter Meeting; a spring board meeting; and a meeting held at the ALA Annual Conference.

ACTIVITIES: PUBLICATIONS, CONFERENCES, AND SERVICES

Public Libraries Magazine

Public Libraries, as the official journal of the Public Library Division, commenced publication in January 1947. The editor at that time was Muriel E. Perry, Decatur Public Library, Decatur, Illinois (From the inaugural issue, *Public Libraries*, Vol. 1, Number 1, January, 1947). *Public Libraries* has since become an increasingly important benefit for members of PLA. In the fall of 1988, an editor was hired and paid a stipend, a change from the prior practice of only reimbursing the editor's expenses. This change was made because the board decided to increase the frequency of the magazine from quarterly to bimonthly. Upon the recommendation of the *Public Libraries* Advisory Board and the PLA Board of Directors, in 1990 the editorial responsibilities were divided with a PLA staff member assuming responsibilities as managing editor working with an outside feature editor. In 2006, the position of Editor became a full time PLA staff member position.

Notable PLA Publications

The PLA has developed several important publications in the management of public libraries. These titles focus on planning and measuring effective service to the community, including technology issues and services to children and young adults (see Table 1).

Preconferences and Workshops

PLA holds workshops as preconferences at the ALA Annual Conference, the PLA National Conferences, and the Spring Symposium, a group of five to six concurrent workshops held every other year. In addition, regional or special purpose events are developed in response to member needs.

Table 1 Key publications from PLA in chronological order

<i>Public Library Data Service Statistical Report</i> (PLA, published annually 1988–present).
<i>Output Measures for Public Library Service to Children—A Manual of Standardized Procedures</i> (ALA, PLA, Association for Library Service to Children, 1992).
<i>PLA Handbook for Writers of Public Library Policies</i> (PLA, 1993).
<i>Bare Bones Young Adult Services: Tips for Public Library Generalists</i> (ALA, 2000).
<i>Latchkey Children in the Public Library</i> (PLA, Association for Library Service to Children, 1988).
<i>Unattended Children in the Public Library: A Resource Guide</i> (PLA, Association for Library Service to Children, 2000).
<i>Planning for Results—A Public Library Transformation Process</i> (ALA, 1998).
<i>Wired for the Future—Developing Your Library Technology Plan</i> (ALA, 1999).
<i>Managing for Results—Effective Resource Allocation for Public Libraries</i> (ALA, 2000).
<i>The New Planning for Results: A Streamlined Approach</i> (ALA, 2001).
<i>Libraries Prosper with Passion, Purpose and Persuasion: A PLA Toolkit for Success</i> (PLA, 2007).
<i>Field Guide to Emergency Response: A Vital Tool for Cultural Institutions</i> (Heritage Preservation, 2006).
<i>Public Library Service Responses 2007</i> (PLA, 2007).
<i>Nursery Rhymes, Songs and Fingerplays: Rhyming Words Will Lead to Teaching Children How to Read!</i> (PLA, 2007).
<i>Defending Access with Confidence: A Practical Workshop on Intellectual Freedom</i> (ALA, 2005).
<i>Managing Facilities for Results: Optimizing Space for Services</i> (ALA, 2007).
<i>Creating Policies for Results from Chaos to Clarity</i> (ALA, 2003).
<i>Staffing for Results: A Guide to Working Smarter</i> (ALA, 2002).
<i>Strategic Planning for Results</i> (ALA, 2008).

Public Library Data Service

The Public Library Data Service is a program of the division that consists of the collection of a set of statistics from a group of approximately 800 public libraries which participate voluntarily. These statistics are published in an annual publication, *The Public Library Data Service Statistical Report*. Don Napoli, Director of the St. Joseph County (Indiana) Public Library, originally collected and reported the statistics as a volunteer. In 1991, data collection was contracted out to the School of Library and Information Services at the University of Wisconsin, Madison; and in 1996 it was contracted out to the Library Research Center at the University of Illinois, Urbana-Champaign. In 2007, an interactive Public Library Data Service Statistical Report subscription database was made available for purchase, in addition to the print publication.

PLA National Conferences

The first PLA National Conference was held in Baltimore, Maryland, in 1983, and attracted 1706 paid registrants. For public librarians, friends of libraries, international visitors, educators, and politicians active in supporting libraries, the Baltimore conference provided opportunities to share ideas on current issues and trends in public librarianship and to hear colleagues and other experts in the field present a variety of educational programs. The format established at this first conference has been used for all subsequent PLA National Conferences. Subsequent PLA National Conferences were held in 1983, 1986, 1988, 1991, 1994, 1996, 1998, and 2000, 2002, 2004, 2006, 2008. These are events of great importance to PLA members and to librarians, trustees, friends, and others concerned with the development of public library services. Since the beginning, these conferences have grown steadily in all areas—attendance, exhibits, number of programs, and revenue. National conferences are currently held every two years, with the next conference scheduled for Portland, Oregon, in 2010 and Philadelphia, Pennsylvania, in 2012.

Certified Public Library Administrator (CPLA) Program

A joint committee with representatives from PLA, LLAMA (Library Leadership and Management Association), and ASCLA (Association of Specialized and Cooperative Library Agencies) was established to respond to the expressed need for education beyond the masters program that would lead to a recognized designation of achievement in public library administration. Begun in 2006, the CPLA program provides post-MLS/post-MIS participants, who complete an established curriculum of courses and demonstrate significant library experience and proof of related activities, the CPLA designation. PLA staff members are responsible for administering course offerings, contracts with presenters and organizers, promotion, registration, and financial management. These courses launched in conjunction with the ALA Allied Professional Association (APA) in summer 2007. The CPLA program is managed by the ALA-APA.

RECENT MAJOR PLA GRANT PROJECTS

The PLA has participated in grant projects related to association priorities. In 2007, the Bill & Melinda Gates Foundation awarded PLA a \$7.7 million grant to develop and provide a national advocacy training program for public librarians from 2007 to 2009. PLA's training program provides librarians with the skills and resources necessary to seek increased funding, create community partnerships, and build alliances with local and regional decision

makers. The training will support libraries that are eligible to receive Bill & Melinda Gates Foundation Opportunity Online hardware grants, which require grantees to match foundation funds with local dollars. It will also be available to non-grantees on a limited basis. Grantees will be encouraged to send teams of up to three people to the locally customized training where they will learn about and create advocacy plans grounded in the reality of their local, political, and economic environment. Each participant will also receive the *PLA publication Libraries Prosper with Passion, Purpose and Persuasion: A PLA Toolkit for Success*, which will provide them with step-by-step instructions for implementing their advocacy plan.

In addition, PLA has participated in grant projects related to association priorities. In 1995–1998, PLA was a partner in the Microsoft/Libraries Online project. Through Libraries Online, the Microsoft Corporation, the ALA/PLA, and the Technology Resource Institute joined forces to ensure that everyone has the chance to succeed in the information age. Libraries Online contributed computers, with the latest software and connections to the Internet, for public use and libraries and provided training for public library staff and patrons. Microsoft committed more than \$15 million in grants and software to this project, in order to help build computer access at over 200 public libraries across the country. Key findings from this project included:

1. Libraries Online provided computers, training, and access to information for people in communities in need.
2. Participating libraries found innovative ways to support and maintain new technologies, even when additional staffing was not provided.
3. Once people were exposed to computing power, they became strong advocates—saying they would always want to have access through their libraries.

CONCLUSION

As the PLA continues to support the development of effective public library services, the focus of the organization will reflect changing conditions in our communities and our culture. Current trends in electronic information affect the development and delivery of information services; current research in early childhood development affects the content and presentation of public library programs for preschool children; growing diversity in our communities affects the development of particular services to meet language and cultural needs; changing lifestyles affect the time and location of the delivery of library services. The officers, members, and staff of the PLA will work together for the advancement of public library service.

Qualitative Research Methods in Library and Information Science [ELIS Classic]

Brett Sutton

Aurora University, Aurora, Illinois, U.S.A.

Print-Qualitative

Abstract

Sutton's essay is a masterpiece of concise, clear, and measured exposition on this difficult area of methodological theory and practice. As Sutton notes at the beginning: "What we call qualitative research out of convenience is actually a diverse collection of philosophies, historical traditions, discipline-specific concepts, and useful practices. One goal of this article is to articulate this diversity. Another is to demonstrate that the dualistic character that the methodological debate has sometimes taken, pitting qualitative against quantitative approaches, is unproductive, not to say unrealistic."

—*ELIS Classic*, from 1998

INTRODUCTION

Social scientists have practiced what is loosely called qualitative research in many forms for the better part of a century. The results have been both numerous and diverse, although some disciplines have found it better suited to their needs than others. Library and information science (LIS), after establishing a strong preference for quantitative approaches to research grounded in the epistemology of the natural sciences, has begun to develop a body of literature that explores nonquantitative methods of knowledge creation. This article seeks to contribute to this development by summarizing the principal features of qualitative research, reviewing its status in information studies, and exploring its potential for generating new research in the field. These tasks, not easy on their own terms, are made more difficult by the lack of precision of the term qualitative research and the absence of a clearly defined body of theory or practice conforming to such a concept. What we call qualitative research out of convenience is actually a diverse collection of philosophies, historical traditions, discipline-specific concepts, and useful practices. One goal of this article is to articulate this diversity. Another is to demonstrate that the dualistic character that the methodological debate has sometimes taken, pitting qualitative against quantitative approaches, is unproductive, not to say unrealistic. This article does not begin with a definition of the term qualitative research because definitions tend to conceal the very ambiguities and complexities that it hopes to capture. It is possible, however, to sketch the outlines of qualitative research by taking note of some of its identifying characteristics. Based on the published record, one might fairly say that qualitative research tends to emphasize interpretation rather than explanation, in-depth case studies rather than controlled multiple-case analyses, analytic description

rather than formal hypothesis testing, narrative reporting of results rather than the presentation of statistical analysis, acceptance of the investigator's subjective involvement rather than the cultivation of a neutral or objective attitude, attention to the uniqueness of the context in which research data are collected, and tolerance for diversity in claims to knowledge. This is not a complete list, however, and none of these factors can be said to be essential to the qualitative approach. Moreover, many real-world studies in the social sciences are hybrid in character, the product of both quantitative and qualitative techniques, so that attempting to isolate purely qualitative studies is something of an artificial exercise.

This article takes the term research rather broadly and nonrestrictively. It is not the goal here to prescribe a programmatic approach to qualitative analysis, but rather to suggest the variety of ways in which such an approach can be integrated into information studies, taking note of the risks as well as the benefits, suggesting the range of tools that are available, and linking these ideas at key points to the LIS literature. Although a number of studies are cited here by way of example, this is not a comprehensive account of the literature of qualitative methods, nor is it intended to serve as a tutorial in even the rudimentary sense. There are two reasons for this. First, the literature on the subject is too vast to summarize in the limited space available. Second and more important, it is not the particular techniques of qualitative research that play the greatest role in characterizing this research tradition, but the principles and theories that support them.

A central premise of this article is that LIS is a social science to which the entire range of research methods used in the social sciences is applicable. Another is that no single approach, however powerful and productive, can successfully solve all the problems in a field as diverse as LIS. There are several dimensions to this problem.

A significant proportion of the research issues in LIS falls into the category of what are sometimes called the “human” sciences, in which researchers are, in an important sense, interpreting themselves rather than explaining an objective natural world. As Neill notes, “the dilemma in the area of research methods in information science is that information creation and use is complex, imprecise, and subjective”.^[1] The concept of information is so deeply part of the social and cultural experience of being human that the study of information cannot be easily detached from the very phenomena it seeks to investigate. This means that the research problems of LIS cannot be entirely captured by tools optimized for the natural sciences. An additional factor is that as an applied science LIS lends itself to a pragmatic handling of research methods. It is frequently the case that investigations in the field are not pursued merely in the interests of basic research but are also employed as tools for accomplishing practical goals, such as improved services to a user community, a better understanding of the research practices of a scholarly field, the design of new information technologies, or the development of public policy regarding access to information. A final complication is that LIS has in recent years allied itself in productive ways with fields ranging from literary criticism to cognitive science, and has taken up the research tools associated with those fields. All of these conditions lead to the necessity of a pluralistic methodology for LIS.

Before undertaking a discussion of the principles of qualitative methods, it is necessary to make two additional terminological clarifications, one involving the term qualitative and the other involving the term method. In the case of the former, the problem is that a false opposition between the terms quantitative and qualitative—implying, among other things, association with descriptions of phenomena that are numerical on the one hand and verbal on the other—threatens to undermine the more interesting and important aspects of the methodological questions under consideration here. Even a cursory examination of successful research illustrates that there are no social phenomena that are intrinsically unquantifiable, nor are there assertions based on quantification that can be articulately conveyed and interpreted without a verbal component. In Kaplan’s words, “The point is that both quality and quantity are misconceived when they are taken to be antithetical or even alternative. Quantities are *of* qualities, and a measured quality *has* just the magnitude expressed in its measure. In a less metaphysical idiom, we could say that whether something is identified as a quality or as a quantity depends on how we choose to represent it in our symbolism” (p. 207).^[2] We seem to be stuck with the terms, but it is wise to allow them to stand not as terms for types of data but as loose descriptors for a collection of concepts and reasoning procedures, and that is how they will be used here.

The other problematic term is method. The trouble here is that by focusing exclusively on method (in the sense of the means or procedures for accomplishing a task), we beg the question of theory and risk, missing some of the more important issues that any discussion of research should raise. It is possible, in fact, to identify at least three different levels of analysis of the research process: philosophy and theory, methods and techniques, and data. Debate over the relative advantages of various approaches to research has taken place within each of these domains. Philosophical questions address the epistemological foundations of scientific research and articulate hidden assumptions about the consequences of various forms of observation and inference. Theory, a natural extension of philosophy, encompasses investigator’s goals in pursuing a particular line of research and their expectations about what that research is likely to yield. Although it is not necessary, nor even advisable, for investigators to begin every research report with a summary of the philosophical justifications behind their theoretical positions, it is nevertheless useful, some would say essential, for them to be able to articulate those principles. Methods, strictly speaking, are the systematic procedures that researchers use to collect and process data in order to put their theories to the test, which in turn leads to the development of new theories. Aspects of method in this sense include research design, the selection and use of research tools and techniques, and the application of certain inferential procedures. Data and the reports that convey them are presented as the formal, tangible results of research and are a direct product of the theories and methods favored by the researchers. In this article the focus is primarily on theory, with some excursions into the area of methods as they relate to these theoretical principles.

QUALITATIVE RESEARCH AND THE LITERATURE OF LIBRARY AND INFORMATION SCIENCE

The literature on qualitative research is vast, ranging from essays on philosophical foundations to practical tutorials. Some of these works are general in nature, while others address the needs of particular disciplines. The methodological writing on research methods in LIS is small by comparison, and concentrates on quantitative approaches, but it is nevertheless worth reviewing, since it reflects the intellectual environment of the field and sheds light on the evolution toward qualitative approaches to research.

An appropriate starting point for this review is Charles C. Williamson’s report to the Carnegie Commission on the state of library education in the 1920s. A central theme in Williamson’s evaluation was not the quality of research in the field or the methods employed, but the virtual absence of research. He criticized librarians for their tendency to gain professional knowledge through trial and

error, an attitude he criticized as “empirical.” Williamson’s review of library education noted its prejudice against science: “I fear most teaching in library schools promotes rather than diminishes the empirical tendency. Quantitative studies are its greatest enemy, but probably not one librarian in a hundred has ever had training in quantitative methods”.^[3] Williamson’s preference for quantitative research sounded a theme that was repeated by numerous later writers. For example, Pierce Butler, in a 1933 essay entitled “The Nature of Science,” stated that “librarianship, in particular, will become scientific only as it conforms in essential to the habitual methods of thought in the modern temper,” which for Butler included the scrutinization of “objective phenomena” with the “rigor of scientific observation,” wherein “every possible device will be utilized for the isolation of activities and their quantitative measurements”.^[4] This positivistic formulation of library science research is important for its rejection of two concepts central to qualitative research: that human action must be understood not in isolation but in its sociocultural context, and that the forms of observation that do not rely on quantification are also useful.

In 1957 *Library Trends* published an issue devoted to research in librarianship. This collection of essays, however, concerned itself with the subject matter of LIS research and did not take up the issue of method. Only one article could be considered methodological, an essay by Leon Carnovsky supporting the pluralistic principle that the nature of an inquiry will properly determine the methods employed, and citing several approaches widely used by qualitatively oriented researchers—case study and historical analysis.^[5] Carnovsky gives highest priority, however, to methods that yield statements on causality and discourages the use of narrative descriptions, which, although they can be difficult to work with, are important to qualitative researchers.

Seven years later, *Library Trends* returned again to the question of research, this time taking up more directly the question of research methods, with articles on many of the approaches currently in use at that time in the LIS community, including surveys, historical research, bibliographical research, and experimental research. Although there is no direct reference in this collection to qualitative methods as such, the collection does include an essay by Jesse Shera in which the author inscribes an inclusive circle of research in the field, avoiding the scientific language of some of his predecessors. He noted, for example, in his review of approaches to research, the value of two fields closely linked to the development of qualitative methods, cultural anthropology, and philosophy.^[6] Shera’s characterization of research as a critical examination of relevant and reliable evidence and its use in producing valid and generalizable findings is broad enough to encompass qualitative as well as quantitative approaches.

Another volume of articles on research methods in LIS appeared in 1970, consisting largely of essays by noted experts in research outside the field.^[7] Although once again qualitative research as an alternative to quantitative research was not explicitly addressed, the volume did contain articles on two methods widely used by qualitative researchers: participant observation and in-depth interviewing. Galvin’s article the same year describes the use of case studies, but passes quickly over their application in research to concentrate on their utility as instructional tools.^[8] In general, methodologists in LIS during this period continued to apply a quantitatively oriented model of research to information studies. In 1969 Herbert Goldhor, an influential theorist, researcher, and educator, wrote an introductory work whose purpose was to teach “how to do research in librarianship” (p. 2).^[9] Although Goldhor’s accounts of the general requirements of research—a well-formed hypothesis, accurate observation, attention to the validity of data collected—do not in themselves rule out qualitative approaches, his strong preference for the natural science approach is clear throughout. For example, he advocates the gathering of “evidence” (defined as accurately recorded data suitable for use with the scientific model of research), distinguishing it from “testimony” (subjective, unverifiable statements gathered under uncontrolled conditions; p. 18).^[9] a form of observation that he considers unsuitable for scientific work. The problem with this distinction is the extent to which it dismisses the sort of subjective, ill-formed data that are of great value in qualitative research.

The search for rigor in library research continued in the 1970s with a strongly worded essay by Busha and Purcell that echoed Williamson’s theme forty years earlier criticizing library researchers for engaging in too much description and bibliographical work with too little attention to generalization or theory construction.^[10] The authors propose in this article a program for library science instruction that includes a minor role for qualitative research, but focuses almost entirely on techniques that have little or no relevance to qualitative work, including formal hypothesis testing and mathematical modeling. The article also makes a very strong case for impartiality and detachment, conditions that are at least problematic from the perspective of qualitative theory. Although the authors suggest that the ideal methods textbook for information studies should present both qualitative and quantitative approaches, they recommend that “heavy emphasis” be placed on the latter (p. 12).^[10]

Several encyclopedia articles on methodology in LIS were published around this time. Busha’s 1978 essay is devoted to quantitative methods and the natural science model, particularly statistics, and contains no references to the qualitative approach.^[11] Similarly, Kaske and Rush focus almost entirely on mathematical, analytical, experimental, and statistical approaches, mentioning, of the

more qualitative approaches, only historical research. Sounding a familiar theme, the authors note that “sound research is based chiefly upon the scientific method, which provides a framework within which hypothesis testing and inferential thought may be carried out in a disciplined manner,” and suggest that because much LIS research has been unscientific, there is doubt about what has been learned.^[12] A collection of essays published in 1981 addresses many aspects of research, but, outside the recurring exception of historical work, either ignores or criticizes approaches that are favored by qualitative researchers.^[13] In his essay on error, for example, Katzer notes: “The weakest type of case is one based on the researcher’s words rather than on the researcher’s (or other researchers’) deeds. The concerns for factual accuracy and generality still need to be considered, but their justification is limited to verbal arguments of what seems to be likely or plausible.”^[14] This statement, which is accurate for research in the natural science tradition, is incompatible with and in some critical ways undermines the value of interpretive approaches to research, which depend heavily on verbal arguments.

In 1984 *Library Trends* published another collection of essays on research in information studies. Although consistent with earlier compendiums, many of the articles in this collection were not directed toward methodological issues, and when methods were addressed, the highest priority continued to be placed on the model of the natural sciences. In the introductory essay to this volume, Lynch develops a distinction between “scientific” research, which seeks to create new knowledge, and “scholarly” research, in which the data are collected from books rather than nature” (p. 369).^[15] The author goes on to suggest that the preference among humanists for the scholarly type of research in conjunction with the affinity of humanists for librarianship accounts for the field’s prejudice against scientific research in library education (p. 371).^[15] Although this argument does place what are now frequently called qualitative methods in a rather unfavorable light, the analysis is nevertheless accurate in its characterization of such methods, which have in fact frequently been inspired—and are often practiced—by humanities scholars. The approach taken in this and most previous essays on the subject—that natural science is the ideal to which research in LIS should aim—was reiterated by a number of other works published in the 1980s.^[16–19]

The preference for quantitative research models in information studies has not gone unchallenged in information studies. There are, among the methodological writings of the field, occasional statements expressing reservations about the mainstream position on research, such as Shiflett’s comment in the 1984 *Library Trends* collection that historians did not usually have the opportunity to perform statistical tests and sought to convince their readers “not by elaborate numerology” but by facts and persuasive argument,^[20] the latter phrase being of

some significance for its recognition of the role of language in scientific research. Occasionally, however, these arguments took the form of sharply worded theoretical statements that can be viewed as part of the larger debate over the identity (and even the name) of the field. Among these are Curtis Wright’s philosophically oriented discussions of library research, key to which is his explicit separation of librarianship from natural science, the exact opposite of the position taken by the mainstream methodologists of LIS, and his skepticism about the appropriateness and utility of the scientific model in the field. Characterizing librarianship as metaphysics rather than physics, and invoking the literature discrediting the positivistic philosophy (unrecognized or unacknowledged by the earlier authors) on which the scientific model is based, Wright notes that “librarians do indeed invert the world of science, because librarianship is the mirror obverse of science as a knowledge system; it is a technology of knowing based on philosophy, not a scientific technology of action.”^[21] Similarly, Michael Harris, in a review of the 1984 methods issue of *Library Trends*, criticized the identification of librarianship with natural science and expressed concern about “the extent to which this profession has systematically isolated itself from contact with significant empirical and theoretical developments in the social sciences.”^[22] Harris was explicit in his criticism of the field for its commitment to varieties of positivism that were in the process of being abandoned in other social sciences, and directed the debate toward the larger question of whether there can be a library “science” at all.^[23] Relevant in this context is Radford’s epistemological critique of the field, which does not explicitly take up the matter of research, but argues, along with Wright and Harris, that the modern conception of the library has been grounded in a positivistic commitment to neutrality and objectivity, values that have figured significantly in the methodological writing in LIS.^[24]

A small number of writers have invoked the social science literature to defend qualitative approaches to knowledge. Several have voiced the need for a broader range of methods in information studies and for research designs that do not in principle reject particular approaches but rather attempt to fit the tool to the task.^[25–27] Others have argued for the use of interpretive methods based on principles derived from hermeneutics and the “human sciences.”^[28,29] In recent years, rising interest in the qualitative approach has produced extended works examining the application of these methods in LIS.^[30–32]

Taken as a whole, this corpus of methodological literature, with some notable and mostly recent exceptions, clearly takes the model of quantitative techniques and the natural sciences to be the best (and in some cases the only) method for use in information studies. It is important to acknowledge the significance and historical purpose of this work, which has not only helped to improve the rigor and the generalizability of LIS research, but has served the

function of encouraging a field rooted in practice to take up a more research-oriented, theoretically driven professional posture, a movement that has helped to increase its credibility among scholars in other fields. This literature reveals very little awareness of qualitative methods, however, and the articulation of a research program that draws on qualitative, interpretive, and naturalistic approaches to research has yet to occur. This is of some interest, since these methods have been practiced for decades in other social sciences, in which lively and productive debates over methodology are commonplace. The remainder of this article briefly surveys some of the principles on which qualitative research is based and discusses the associated techniques that have proved useful in information studies.

THE PRINCIPLES OF QUALITATIVE RESEARCH

Although it is possible to generate data by applying the techniques of social science research without reference to the philosophical principles on which those techniques are based, it is difficult for researchers to build useful theory out of those data without some understanding of those principles. Research is not so much a matter of gathering up data that already exist, but a process of making successive observations and inferences during which data are not merely gathered but in some sense created according to the theoretical assumptions that drive the researcher's approach. As the authors of a recent methodological essay have pointed out, "The various happenings, objects and people of the world are not data until made relevant within a framework which constitutes them as evidential materials for some purpose."^[33] This in turn suggests that to gain an effective command of a research method is more than just mastering certain skills and tools, but also entails cultivating an understanding of the epistemological implications that drive them. There is no canonical list of the theoretical propositions on which qualitative research is based, but the paragraphs that follow summarize some of the more significant ones evident in the qualitative research of the social sciences.

Most methodologists, whatever their orientation, would agree that *empiricism*, the principle that knowledge is based on observations of the world rather than the imagination, is fundamental to any kind of scientific research. Although Williamson, as noted above, accused librarians of harboring an "empirical tendency" that was an impediment to doing useful research, it is clear that there can be no research in the usual sense of the term without the use of the senses. Quantitative and qualitative researchers differ, however, on the role of the observer. The former tend to argue that scientific observations of the world must be achieved with minimal personal involvement, and lean toward the positivistic position that the most secure form of knowledge is produced by observations that can be

verified by any observer. From this perspective, the researcher is a data-gathering instrument. Qualitatively oriented researchers, on the other hand, without sacrificing their scientific goals, find it not only difficult but a source of error to overlook the interpretive role of the observer. This view is a result of the recognition by qualitative researchers of the role of the knowing subject, a concept that can be traced in the philosophical literature to Kant's break with Cartesian dualism, particularly as articulated in the work of philosophers such as Wilhelm Dilthey and Alfred Schütz. Qualitative researchers, nevertheless, do not believe that their recognition of the role of the observer undermines the claims of qualitative research to being empirical or even scientific, and include in their methods a commitment to basic principles such as validity, reliability, falsifiability, and the proper use of inductive thinking. The key difference is that the researcher is taken to be an interpretive rather than merely a recording instrument. At the risk of oversimplification, one might even say that quantitative research tends to seek to repress the subjective, while qualitative research accepts and even exploits it.

Qualitative research is often associated with *naturalism*, which in this context refers to the avoidance of abstract or reductionist forms of data collecting and analysis and the construction of any explanatory apparatus that is at odds with the subjects' own experience of the phenomena under study.^[34,35] Naturalistic researchers thus tend to focus on the ongoing multidimensional character of the social world, an approach that tends to increase the proximity of researchers to their subjects, and to report their understandings of this world in ways that respect its irreducibility. Practitioners of the naturalistic approach are generally more interesting in discovery and insight than in establishing laws through formal hypothesis testing (although what is discovered may later be confirmed using quantitative procedures), and tend to seek understanding of phenomena in a way that reflects their interrelatedness and complexity. Thus, observation in naturalistic research sometimes takes the form of complex, detailed descriptions rather than the isolation of discrete variables. One particularly interesting feature of naturalistic research is its tolerance of ambiguity and incompleteness. Quantitative approaches are frequently designed to reduce ambiguity by focusing exclusively on those observations that can be objectively confirmed. Qualitative research recognizes complications that call confirmability into question, including politics (people involved in competition over power don't always say everything that they know) and the subconscious (people don't always say everything that is true, whatever they may happen to believe), and looks for ways to operate within these constraints.

Many forms of qualitative research are based on the principles of *constructivism*, a term that refers to the social processes by which humans create a meaningful world. A

central assumption of this approach is that meaning (such as the utility of an information source for a user, the relevance of a fact to a need, or the cultural role of a library) is not an inherent attribute or phenomenon, but is continuously created and recreated by the human participants in that world. Qualitative, interpretive methods provide the tools for understanding and explaining this process. A landmark account of this way of examining the social world is Berger and Luckman's *The Social Construction of Reality*,^[36] a work that has had a major influence on social science research in many disciplines. Constructivism places a great deal of emphasis on the observer and on the process of interpretation. From the perspective of information studies, constructivism is concerned with the processes by which knowledge is made and how it is identified as knowledge. Social studies of science, which examine the details of the settings in which scientific knowledge is created, fall into this category.^[37] Recent applications of constructionist theory in educational evaluation, a subdiscipline that is of particular relevance to LIS, have been explored by Guba and Lincoln.^[38]

One form of constructivist research is *symbolic interactionism*, a term that is applicable both to a theoretical approach as well as to a collection of research techniques. Chief among its philosophical founders is George Herbert Mead.^[39] According to Herbert Blumer, a sociologist who has given Mead's theory methodological form, the three principles of symbolic interactionism are first, that humans act toward the things of the world on the basis of the meanings those things have for them; second, that meaning is derived from social interaction; and third, that meanings are managed through an ongoing interpretive process.^[40] Understanding social reality from the perspective of symbolic interactionism thus requires not just the gathering of objective data, but the negotiation of a complex network of the processes through which meaning is constructed.^[41]

Central to both constructivism and interactionism is the principle of the interconnectedness of social phenomena. One of the concerns that qualitative researchers tend to have about formal data-gathering instruments such as surveys forms, particularly when used alone, is that they are too effective in filtering out the surrounding social environment. Qualitative research is often designed more to explore the relationships between the phenomenon under investigation and its entire environment than to decompose a research question into parts, an approach sometimes referred to as *holism*. Diesing describes the concept as follows: "The holist standpoint includes the belief that human systems tend to develop a characteristic wholeness or integrity. They are not simply a loose collection of traits or wants or reflexes or variables of any sort: they have a unity that manifests itself in nearly every part" (p. 137).^[42] Moreover, the concepts used to capture this holistic quality must be relatively concrete and particularized, close to the

real system being described, rather than abstract mathematical concepts developed in some other science and imposed on the subject matter a priori or concepts that grow out of a testing instrument and get their meaning from the instrument. As many of the concepts as possible should be derived from the subject matter itself, from the thinking of the people being studied; and the other concepts should at least not be foreign to their way of thinking (p. 139).^[42]

Qualitative researchers, whatever their particular research goals or techniques, are usually interested in the meaning of natural human contexts in this holistic sense, which requires attention to more than just the object under examination. This has important methodological ramifications for the qualitative researcher, favoring an "immersion" approach in which the observer is present in the research setting for extended periods of time, a labor-intensive but data-rich way to discover the multiple dimensions of the subject under study that would drop out of many more formalistic, quantitative approaches.

Another way to characterize qualitative research is to say that it emphasizes *discovery* over explanation. This approach to research problems has yet to be broadly practiced in information studies, which historically have tended to focus on the problems of causality, prediction, and control. Pierce Butler, for example, in a discussion of scientific research, noted that "so far as they are possible, explanations will be formulated in chains of immediate causes."^[4] Qualitative methods do not lend themselves easily to these sorts of research goals, but are grounded in the recognition that for symbol-making human beings, "causes" often take the form of articulations of meaning rather than objective accounts of sequences of events (pp. 140–142).^[34] It is not immediate causes that interest qualitative researchers, but frameworks of significance.

The recognition of the significance of subjectivity and contextuality in the human sciences leads to the twin issues of *relativism* and *pluralism*. Relativism refers to the principle that the standards of what passes for truth are not the same in every human community and therefore that each community must be understood in its own terms, while pluralism in the corresponding recognition that the social world cannot be reduced to a single paradigm or system of explanations. These principles have implications not only for the understanding of how people view their own environments and experiences, but also how researchers view those people as subjects of research. Most important, they suggest that the scientific observer's role, particularly in the human sciences, is never purely objective, but is conditioned by values and expectations. The unity of knowledge as a total, well-integrated system that is posited by natural science is not feasible according to this view. It follows that if knowledge has pluralistic aspects then the methods use to produce it must be equally diverse.

In this vein, some theorists have taken as a subject of analysis science itself and identified the possibility of multiple forms of scientific knowledge, distinguishing, for

example, traditional science from a “feminist” science.^[43,44] A pluralistic view of knowledge necessarily admits natural science, but does not necessarily accord it a privileged position.

The key to accommodation among paradigms is rejection of the “queen science” viewpoint that philosophical first principles must determine methodology. Once one begins to look at what researchers do, the walls between paradigms start to break down. In practice, researchers use a variety of imperfect approaches to enhance the credibility of their arguments that require complex trade-offs among precision, generalization, and existential reality.^[45]

This assertion, that there are no clear standards against which to measure knowledge, is possibly one of the most disturbing and challenging aspects of the interpretivist approach to research, but it has the advantage of accommodating a wide range of research practices, a situation of considerable benefit to a multidisciplinary field such as library and information studies.

Another problematic aspect of qualitative research is its accommodation of *subjectivity*, a concept with two linked aspects: the subjectivity of the targets of research and the subjectivity of the researcher. The first refers to the recognition that those persons whose behavior social science attempts to understand and explain possess a subjectively constructed view of the world that may not only be concealed from the scientific observer but also may not be easily articulated even by those who possess it. Human behavior is a complexity that is highly resistant to being untangled by outsiders in a way that accurately reflects its meaning for insiders. While this may not be a serious problem when the subjects of the investigation are members of the researchers’ own culture (often the case in information studies), it can lead to invalid results if the researcher and subject do not share common assumptions and the researcher’s methods are poorly chosen. Some of the most interesting methodological solutions to this problem have been devised by anthropologists, who more than any other social scientists face the challenge of comprehending world views radically different from their own and who have developed ethnographic tools to achieve this goal. But it is clear that similar difficulties are present even when the subjects of research are not members of other cultures. For example, concerns about possible disjunctions between the assumptions of information professionals and their users is a significant issue in information studies, and the application of qualitative approaches to observation and analysis opens the way for new strategies for developing more responsive and effective information systems. Well known among the research addressing this problem is Dervin’s approach to the problem of user needs, which takes into account the users’ own environment and their subjective adaptation to it.^[46–48]

The second key aspect of the subjectivity question focuses on the subjective role of the observer, which can be managed in qualitative research but in principle never

neutralized. The principles of constructivism and relativism mean that no human observer can be wholly detached from the research setting, and many qualitative approaches to social research recognize this condition. Research performed under the constraints of subjectivism can be viewed as an attempt to link the perceptions of the observer and the observed by achieving some degree of common understanding, not always an easy task. Norman Denzin has noted that “being a scientist reflects a continual attempt to lift one’s own idiosyncratic experiences to the level of the consensual and the shared meaning. It is in this context that the research method becomes the major means of acting on the symbolic environment and making those actions consensual in the broader community of sociologists” (p. 12).^[49] The use of participant observation, for example, provides an opportunity for researchers to experience firsthand the phenomena under investigation from a perspective similar to the other actors, an approach that forces recognition of the observer’s own role in the research setting. A notable example is Janice Radaway’s ethnographic study of women who read romance novels, a work that concentrates not on the texts themselves but on the meaning they have for their readers. As the author notes, the construction of meaning in this project involved the observer as well as the observed: “It is essential to point out here that in formulating a hypothesis about the significance of romance reading as an act, that hypothesis inevitably will be a critic’s construction of the reader’s construction of the import of her reading behavior.”^[50]

This characterization of social behavior contrasts with quantitative approaches that make an attempt to isolate certain unwanted forms of meaning, which are sometimes described as bias, from other forms that are described as fact. Qualitative theory does not accept so quickly the characterization of bias as “noise” that must be eliminated; rather, it recognizes that all observations are biased in the sense that they reflect the observer’s intentions and ways of knowing and are inevitably accompanied by unstated assumptions. The task is not to eliminate bias, but to examine it and determine the degree to which it can be controlled. Linked to the issue of the researcher’s subjectivity are questions regarding the truth value of published research results. Qualitative research reports are sometimes essentially first-person descriptive reports of these experiences, a situation that has led to considerable debate over the role of the researcher’s own narrative voice in social science reporting.^[51,52] Acknowledging one’s limitations as an observer, of course, has its risks. It would be a mistake to equate the limitations on the role of the observer with a complete lack of objectivity, and successful qualitative research still requires that the observer maintain a certain balance between detached analysis on the one hand and sympathetic participation on the other, so as to avoid, for example, the dangers of interpreting events as more patterned than they actually are or “going

native” by becoming completely absorbed by the setting and losing the analytic perspective of the researcher.

An interesting and important result of the acknowledgment of observer subjectivity in qualitative research is a heightened sensitivity to issues of *values* and *ethics*. To recognize that the researcher is also an actor is the research setting may raise serious moral and political issues.^[53,54] Qualitative researchers, because of the involving nature of their work, frequently find themselves handling privileged information, falling into moral dilemmas, gaining knowledge of immoral or even illegal acts, becoming entangled in power conflicts, and in other ways being forced out of their roles as neutral observers. Qualitative researchers also face ethical questions when they presume to speak for silent or powerless individuals, particularly when those expressions have the power to influence others’ lives positively or negatively. It is but a short step from a researcher’s acknowledgment that social research cannot be value-free (as natural science has sometimes claimed to be), to the adoption of an activist approach to research whose goal is not merely knowledge, but social change. The perspectives of the “critical theorists,” inspired by the work of writers such as Theodore Adorno, Herbert Marcuse, and Michel Foucault, have drawn the attention of qualitative researchers to these issues.^[55] Recognition of the role of libraries as agents for social change has a lengthy history in LIS, and although this aspect of the field has not inspired a large number of research efforts, there have been attempts to develop these ideas in the LIS literature. Examples include Berman’s revealing juxtaposition of Library of Congress subject headings with facts and commentaries from a variety of other sources, exposing the value-laden nature of the former.^[56] Buschman and Carbone’s application of new theories of education to LIS,^[57] and Frohmann’s critique of the limitations of the “cognitive viewpoint” in LIS.^[58]

METHODS AND TOOLS

As noted above, although a primary purpose of research is to gather data, it is clear that research is more than “fact finding.” No observation, whether recorded as words, numbers, images, or something else, is inherently “factual,” nor do data occur naturally, but rather are the product of observations, which are themselves conditioned by theory. In this sense constructionist principles apply not only to the objects of research, but to the research process as well. Neither theory without data nor data without theory can lay a claim to being research. The process of moving from theory to data is a difficult one, and it is in this relationship that the essence of qualitative research lies. Quantitative researchers use the term *operationalize* to describe the process by which a hypothesis or research question is embodied by some form of data, and

qualitative researchers must pass through a similar stage. This section contains descriptions of some of the higher-level methodological approaches that are used to realize the theoretical goals of qualitative research. Details on the numerous tools and techniques that are appropriate to each of these approaches are described in the handbooks listed in the bibliography at the end of this article.

The *historical* approach to the analysis of human society and culture is sometimes overlooked as a member of the family of qualitative approaches to research, but it is one that embodies many of the attributes described above, and has the added distinction of being used continuously in information studies longer than any other qualitative approach.^[59] Although not every form of historical writing can be considered qualitative, or even research in the social scientific sense, the data-gathering and analytical processes used by historians share a number of important features with other forms of qualitative work, with the close examination of documentary evidence taking the place of direct observation of the social world.^[60] One might argue that some forms of historical writing are examples of ethnographic analysis practiced in remote time frames. Included in this category are biographical works that seek an understanding of the history of libraries and information systems by examining the life and work of individuals who have played pivotal roles in their development, the historical equivalent of the life history method that is widely used in anthropology.

The task of historians is to overcome the analytical limitations of examining phenomena through indirect means. Most forms of qualitative work, however, are designed to avoid having to resort to indirect measurements of human behavior and instead place the researcher as close as possible to the events under examination. These practices are often referred to collectively as *ethnographic* methods. Many entail some form of *participant observation*, in which the researcher, rather than taking up the position of a detached observer, makes an effort to take part in the phenomena under investigation, and in doing so is in a position to perceive complexities of the setting that might otherwise escape attention. “Participation” might be as simple as a series of informal discussions with a subject or as complex as an extended period of full-time residence in the community under examination. Being able to interact with the research subjects in a continuous way, to observe directly the complexities and uniqueness of individual behavior, and to follow the patterns of changing events, are all benefits of this approach. Perhaps most important, participant observation makes it possible to gather data on the subtle and unpredictable events of normal human environment. To give a simple example, the author of this article was sitting in a meeting of librarians, listening to a serious discussion of proposed changes to the library’s mission statement, when one of the staff members passed over a scrap of paper on which were written the words “You’ll note a certain ‘Alice in

Wonderland' character to these discussions." This impromptu act, small as it was, revealed aspects of the organization's culture that staff had not up to that point articulated in more formal interview settings. In a similar way, Forsythe used participant observation to study the work of knowledge engineers, achieving an understanding of their perception of human knowledge and how this perception dramatized the contrast between belief and practice that might have otherwise remain concealed.^[61]

Engaging in ethnographic work and participant observation does entail certain trade-offs. Although these methods are capable of producing richly detailed, highly accurate depictions of social phenomena, they possess certain disadvantages. One is that they tend to generate massive amounts of data, which may include extensive field notes, charts and tables, photographs, transcribed recordings, documents, artifacts, and even quantitative data sets. The higher the volume of data, the more complex the analysis and the greater the time and effort required to move from the planning stages of a research project to the finished report. Qualitative researchers have found their work more difficult than the tasks typically associated with quantitative research to the extent that they have not had the same efficient tools for data processing that are available to quantitative researchers (although the availability of new computer tools for organizing and analyzing qualitative data is changing that). A second class of disadvantages is a consequence of the highly contextualized level at which qualitative research tends to occur. The findings of ethnographic field studies, for example, do not lead as easily to predictive models of behavior, and are not as easily generalized beyond the setting in which they were produced. Moreover, ethnographic approaches can place greater personal stress on the researcher, resulting from difficulties in entering into and maintaining relationships in an unfamiliar social environment.

Compared to the work produced in sociology, anthropology, and education, LIS has not produced large numbers of ethnographic studies. One effort worthy of mention is the High John project, an ambitious experiment in which library students from the University of Maryland collaboratively developed and staffed a public library in an economically disadvantaged minority community.^[62] Although this project had more to do with library development and education than research, it possessed many of the attributes of ethnographic field work (extended participatory involvement in an unfamiliar community, close attention to process, a case-study concentration on a single setting), and serves as an indicator of the kinds of opportunities that exist for field-oriented studies in LIS. Examples of the use of ethnographic research methods in information studies are Chatman's study of the information needs and practices of elderly women^[63] and Tanner's account of the role of ministers as information providers.^[64] Another ethnographic study relevant to the concerns of LIS is Heath's field-based comparative

analysis of speech, reading, and writing in socioeconomically contrasting communities.^[65] Heath's work is just one example of an expanding body of work that examines the sociocultural aspects of reading.^[66] Zuboff's study of the role of information technology in a changing workplace is another useful implementation of ethnographic methods.^[67] The rapidly developing area of the sociology of science has also produced ethnographic studies that provide insights into the ways that scientists produce knowledge and the social dynamics of the writing and publishing process.^[68,37]

Field-based ethnographic research is the classic form of qualitative research, but it is not as much of a "method" as it is a setting in which a wide variety of particular methods might be employed. One of the most common ethnographic tools is *interviewing*, a technique based in large part on conversation, arguably the most natural of all forms of human communication. The subject of interviewing, which is addressed in nearly every handbook of qualitative methods, has long been recognized in sociology for its ability to generate the kind of data that are useful to qualitative analysis.^[69] For researchers unable to actually live or work as participant observers in the community under study, interviewing is one of the most effective ways of collecting qualitative data. Interviewing takes many forms; it may be more or less structured, brief or extended, individual or group-oriented. Researchers may confine their attention to a single cooperative informant, or they may employ sampling procedures to interview a large number of people. Within an interview, the researcher may engage in a variety of tasks: establish rapport in the community, collect life-history accounts, administer open-ended surveys, probe for explanations to questions raised by other aspects of the research process, or conduct psychological tests. Interviewing may be employed, in fact, as a high-yield method for collecting closed-response survey data, and used as such is not really a qualitative method at all. Often in interviewing it is important to gather the subject's responses verbatim, which requires either very careful note taking or recording. This not only facilitates later analysis, but it protects researchers from their tendency to project meaning unintended by the speaker when recording the events in the form of field notes. A disadvantage of interviewing is that it is not entirely a natural setting, and the subjects' awareness of the interviewer's role and purposes may lead them to modify what they say, but this problem can be compensated for by interviewing a large number of subjects, or the same subject a large number of times.

Much qualitative research is based on the *case-study* model, the basis of which is an in-depth understanding of a single event or setting. Typically, in case-study analysis, "the emphasis is on the individuality or uniqueness of the system, its wholeness or boundedness, and the ways it maintains its individuality" (p. 5).^[42] Detailed case studies have limited use in quantitative approaches in which the

goal is the identification of regularities over multiple cases, but they are ideally suited to the goals of qualitative work, in which the recording of contextual detail is a high priority and the researcher can focus on what Denzin calls the “situated aspects” of human conduct (p. 10).^[49] Case studies are often narrative in their final form, but they may be constructed using a variety of data types, a strategy that increases the richness and also the validity of the study. Cases may be reported individually, but gain value when they are juxtaposed with additional similar cases, yielding a comparative case study capable of highlighting not only what is unique about each case, but what they have in common.^[70] In LIS the case method has been used productively in the longitudinal analysis of attitudes and behaviors of information system users, incorporating participant journals and logs, interviews, observational analysis, relevance judgments, and citation analysis, and combining all the elements in a detailed contextual account of the user’s experience.^[71,72]

Qualitative approaches to research tend to be less regularized and structured than quantitative approaches. It would be difficult in fact to demonstrate that qualitative research constituted a particular “system” or set of linked procedures, a characteristic that makes qualitative methods difficult to master. Methodologists, however have succeeded in developing qualitative research approaches that have a certain systematic character. One that has been widely studied and applied is the *grounded theory* approach, as articulated by Glazer and Strauss.^[73,74] The principal purpose of this method is the inductive generation of theory from data through a disciplined application of observation and interpretation. The developers of this approach note that theory is said to be properly grounded when it fits the data used to generate it, is understandable to both the researcher and the subjects of the research, remains abstract enough that it can be usefully applied in other settings, and offers the researcher sufficient tools to exercise some control over its application in subsequent situations (pp. 237–249).^[73] Grounded theory is more than an interesting intellectual construct; it is a practical tool for building useful knowledge about social settings. Its focus on utility and application makes it well suited to a professional field such as LIS, where it has seen some use in recent years.^[75,76]

Another systematic qualitative approach is *ethnomethodology*, which can be briefly described as the study of commonplace behaviors in natural contexts, with particular emphasis on how individuals organize and make sense of their environments.^[77,78] Ethnomethodology is inspired by phenomenological philosophy, which takes up the question of the semantic organization of the social world and is also closely linked to the principles of constructivism. Of particular interest to ethnomethodologists is the use of language, especially the forms of speech that ethnomethodologists call “indexical expressions,” utterances whose meaning cannot be determined apart from the

context of their use. Paying attention to what people normally take for granted, asking how it is that those commonplace perceptions are created, and investigating the procedures by which these meanings are conveyed is the work of ethnomethodology. This approach seeks not only to account for humans’ understanding of their social environments, but also social processes by which that understanding is negotiated and maintained. Ethnomethodological approaches have been applied to several problems in information studies. Relevant to the field of user studies, for example, is Whalen and Zimmerman’s analysis of telephone requests to dispatchers of emergency assistance, a study that elucidates how callers use their knowledge of the conversational situation and how they make their purposes evident.^[79] An influential study with ethnomethodological components is Suchman’s exploration of the complex ways that humans react to machines. A principal theme of this work is to demonstrate that insofar as actions are always situated in particular social and physical circumstances the situation is crucial to the actor’s interpretation.”^[80] This understanding has important theoretical implications for sociologists, but it also has practical consequences for the designers of information systems, who must learn to anticipate the complex and not always predictable ways that users respond to the tools that they use.

As some of these examples have already suggested, there is no form of data more important in qualitative research than language, and the methods used in qualitative work are often designed to elicit, organize, process, and analyze both written and spoken language. Working with words poses certain problems not encountered with numbers, however. Their meaning is in part a consequence of the context in which they appear and changes over time. They are difficult to record and process, and they possess an interpretive openness that complicates analysis. As noted above, quantitative methodologists have on occasion looked for ways to avoid the entanglements of interpretive language altogether, considering it a contaminating force in scientific research, but for qualitative theorists, the role of language in structuring human experience is an essential feature of the research setting, which neither the subjects of research nor the researchers themselves can avoid. Clearly this raises many problems in analyzing linguistic data collected from informants, but those problems also extend to the researcher’s own use of words in reporting the results of research. This is a pattern that holds true, qualitative theorists are eager to point out, even for positivistically oriented researchers. For example, in a critique of the quantitative orthodoxy of economics, Donald McCloskey defends the role of words: “If science is to cohere it must use the art of argument; and if it is to be agreed upon by free people it must be argued persuasively. In English the words ‘science’ and ‘rhetoric’ quarrel childishly.”^[81] An interesting body of literature on the rhetorical character of science that is of particular

relevance to LIS are sociological studies of the verbal strategies employed by scientists in reporting their work.^[82]

One class of useful qualitative research techniques that draw on the centrality of language view human settings as “texts” that observers may examine in order to extract their meaning and come to an understanding of the processes that drive them. Semiotics, for example, the study of signs and their significance, is a branch of linguistics that has been widely applied as a research tool in many disciplines, including communications, anthropology, and literary criticism. Warner has suggested incorporating semiotics into LIS as a way to extend the dimensions of the latter field beyond its customary alignment with the physical sciences and technology.^[83] Other examples of the use of literary studies in LIS are those that draw on the characteristically human tendency to organize experience as narrative or story. One example is Urquhart and Crane’s use of narrative vignettes drawn from the professional literature as a way to elicit in a realistic way data about the information skills of nurses.^[84] A similar strategy is the use of protocol analysis by the builders of expert systems as a method of capturing the elusive knowledge of human experts. This technique involves asking subjects to perform a task while simultaneously producing a narrative account of that task, which can then be used to derive formalized accounts of that knowledge.^[85,86] Another study in which language plays a key role is Myer’s contextual analysis of scientists’ progressive revisions of patent applications, examining the social conditions that affect the articulation of new knowledge.^[87] Also attracting some interest in information studies is “reader-response criticism,” a type of literary analysis based on the proposition that the meaning of a text resides not in the words, but in the reader’s reaction to those words.^[88] Radaway’s study of romance readers is one notable contribution to this literature.^[50] Such studies, when used to determine the effect of literature on various communities of readers, are tools that can be used by libraries to help solve the always difficult task of understanding what their communities want, and has practical consequences for collection development.

CONCLUSION

This article, although brief has traversed a rather wide range of territory. Even as a special topic within the social sciences, qualitative methods lacks distinct boundaries, and any discussion that attempts to summarize this approach runs the risk of granting to the topic a false degree of concreteness. In that regard it is useful to conclude with two related points of a cautionary nature. The first is to clarify that it is not the purpose of this article to impose an authoritarian or prescriptive character to the subject of qualitative methods, but to present a

representative range of issues and techniques. This is in keeping with the spirit of the qualitative approach, which is useful in complex or rapidly changing settings precisely because of its open-ended and adaptable nature. It is unlikely, in fact, that any abstract analysis can really do justice to the topic. Although for reasons already stated this article has taken a somewhat theoretical approach, neither this nor any other similar treatment of the subject is more effective in conveying the essence of the qualitative approach to students of method than a patient examination of the published research literature, and readers interested in learning to use these tools are encouraged to seek out the best examples of qualitative research, not just in LIS but in related fields as well. By extension, just as reading about the principles of research cannot replace reading actual research reports, reading published reports cannot take the place of firsthand field experience. To apply the tools of qualitative research to real research questions and to struggle with the problems of data collecting and analysis using qualitative paradigms is one of the most effective ways of coming to terms with their utility and significance.

The second (and related) point is that any set of research tools must ultimately be measured by the effectiveness of those tools in producing the kinds of understanding that significantly advance the field of study in which they are used. Reflective methodologists are familiar with the danger that a particular set of research tools, once widely used, may become entrenched, and rather than serving the cause of creating new knowledge, may come to dominate it by limiting the kinds of questions that are asked and the kinds of answers that are judged acceptable. According to Abraham Kaplan, who named this condition “the law of the instrument,” what is objectionable about this situation “is not that some techniques are pushed to the utmost, but that others, in consequence, are denied the name of science” (p. 29).^[2] One of the main contributions of qualitative research methods to information studies is their role in increasing the variety of the contents of the researcher’s toolkit, and consequently in expanding the range of what can be learned. This is of particular significance in a field as diverse and rapidly changing as LIS.

Rare Book Collections

Andrew J. Berner

University Club of New York, New York, New York, U.S.A.

Abstract

This entry presents a history and definition of rare book collections, as well as a description of how they are formed and maintained. There are two major responsibilities that rare book librarians face in their role as stewards of these collections: collections must be made available for use, and at the same time, care must be taken to ensure that delicate, and often unique, materials are preserved to ensure their availability in the future as well.

INTRODUCTION

The identification of rare books as such and their segregation as distinct parts of general library collections are relatively recent phenomena. The origins of modern rare book collections are largely to be found in the eighteenth and nineteenth centuries, a time when book collecting came into its own as a private endeavor and when the antiquarian book trade developed to meet the needs of those private collectors and to create new demand for rare books. This led to an increased awareness of rare books as a separate entity within the general world of books and manuscripts, although certain book rarities had long been considered worthy of collecting. Incunabula—books printed in the period from the appearance of movable metal type (ca. 1455) until the end of the year 1500—were highly sought by collectors, as were other books and manuscripts whose age and other factors made them significant. Although the existence of collections of books had been in place for centuries in institutional settings, these were not rare book collections per se.

The earliest interest in establishing collections of rare books (i.e., books collected for their rarity) came primarily from individuals and particularly those individuals whose wealth and/or social standing made it possible for them to devote time and funds to such an activity and to relish the intellectual cachet that a fine collection provided. At the same time that the overall awareness of rare books was increasing, the identification of significant volumes, worthy of being collected, was made easier by the rise of modern scholarship and the modern system of academic training. These worked to create a body of knowledge of what constituted the key works in most fields of study, many of which fell into the category of rare books. In addition, research, which had long been recognized as a part of scientific work, came to be accepted as a necessary component of study in other fields as well. To support this

research, viable collections of source materials needed to exist, and again it was rare books and manuscripts that offered some of the best resources.

On the institutional level, the movement to segregate rare books and manuscripts into distinct collections, or even into separate libraries, developed most strongly in the United States, coming somewhat later to Europe and other areas. Perhaps this was because the age of the libraries involved was a major factor in the ease with which the segregation of these materials could take place. In Europe, for example, where many libraries had been developing their collections for hundreds of years, older volumes and volumes that were considered “significant,” tended to have long been incorporated into general collections. Identifying them, locating them, and physically moving them was no easy task. In the United States, with so many collections being started and so many libraries being organized—particularly in the nineteenth century—it was easier to identify and segregate the rare materials where they were present or to work with the newly active antiquarian book trade to purchase works specifically to establish or expand a rare book collection; this was true particularly in academic settings, where such collections came to be seen as an important adjunct to the educational mission of the parent institution.

It was also in the United States that the term “special collections” first came into use to describe a particular type of institutional collection. This term has always suffered from an imprecision of meaning, a problem that is compounded by the fact that its definition has evolved over the years. Originally, a special collection was simply one that had a specific subject focus and was, thereby, “specialized.” This topical focus remained important, although additional factors came into play over the years, such as the depth of the collection and the extent to which it included what might be considered the primary source materials within its given topic. Rare books would often

be part of such collections, but the collections included much else as well. Additional formats might include, for example, photographs, ephemera, manuscripts, prints, drawings, and various forms of realia. To add to the confusion, the term “special collection” is, at times, used synonymously with the term “rare book collection,” or they are used jointly, as in “rare books and special collections.” Generally speaking, all rare book collections are special collections, but the converse is not true. That is, not all special collections are rare book collections. In all cases, the two—rare book collections and other special collections—form a complementary whole as a resource for scholarship and as a section of the library’s collections that, compared with general library collections, is treated in a special manner for such standard library practices as acquisition, cataloging, processing, storage, security, conservation/preservation, and use.

WHAT CONSTITUTES A RARE BOOK?

In its purest sense, the word “rare” means existing in limited numbers, and this is certainly true of rare books as well. But although the number of copies of a particular book may be one factor in determining if it qualifies as rare, it is certainly not the only factor, and, indeed, it is probably not the most important one. The determination of whether a book qualifies as rare (i.e., whether it merits placement in a collection of rare books) is, in some ways, one of the purest applications of the law of supply and demand. Not only should there be a relatively small number of copies of a work, but it should be in high demand as well. As noted bibliographer A.W. Pollard wrote in his entry on “book-collecting” in the famed 11th edition of *The Encyclopædia Britannica*, “. . .the rarity of a book devoid of interest is a matter of no concern.”^[1] The demand for a particular book, then, is determined by the level of interest or desirability it engenders, and that, in turn, is determined by numerous factors.

Laypeople often think that age alone makes a book desirable, and therefore rare, but this is not the case. Many fine press books of the twentieth century are considerably more desirable than are certain books of earlier centuries. Whatever their age, early editions of important works are generally considered desirable, as are works that brought to the world new discoveries and new ways of looking at things, whether geographic, philosophic, economic, scientific, or artistic. Illustrations can often affect the desirability of a book, particularly if they are early examples of a specific technique, if they are especially fine in quality, or if they were done by a noted artist. Controversial works tend to be desirable and are often to be found in small numbers if they were the subject of censorship when they were first issued. Even the place of publication of a particular work can affect its desirability. Early examples of imprints from a particular location tend to be sought,

although if the location is of relative unimportance, the desirability of its early imprints is likely to be only local. There are times when factors other than those intrinsic in the book itself have a great effect on its desirability. Provenance, for example, is a major factor. Books that were owned by famous people or were demonstrably parts of famous private collections have an increased cachet. Related to provenance are books containing notes or marginalia by famous people, particularly if they are commenting on a controversial or significant work. Presentation copies (i.e., books that have been presented to someone by the author and bear the author’s signature) are desirable, the more so if the author is particularly famous, if the book is noteworthy, or if the person to whom it was presented is prominent. Many other factors go into determining desirability as well, including special bindings, limited editions or special printings, and, of course, the condition of the book. Clearly, there is more to determining if a book is rare than simply the number of copies that exist.

Because the determination of rarity involves the application of the law of supply and demand, it is not surprising that the monetary value of a book also plays a part in the decision whether to segregate it in a rare book collection. Here, however, we must tread carefully. Value is less a factor in determining a book’s desirability than it is the product of that desirability coupled with the number of copies available. Still, because the value of a book is generally influenced directly by the aforementioned factors, value is often used as one of the primary guidelines in determining what books will be segregated. This can lead to difficulties as prices for mainstream books continue to rise. Although particularly expensive mainstream books may need to be segregated in some way to make them more secure, they are not necessarily rare and do not necessarily merit inclusion in a rare book collection. In addition, it is not unusual for all books of a certain age (e.g., eighteenth century or earlier) to be segregated into rare book collections, whether they have a monetary value commensurate with other materials deemed rare. Because there are no hard-and-fast rules about what should or should not be segregated and because “local” considerations often come into play, what is deemed to constitute a rare book in one collection may not be deemed so in another.

Whatever factors are used to determine whether a book should be segregated into a rare book collection, the fact remains that this determination is not a one-time event; it must be an ongoing process. Changing tastes and changing demand lead to a constant shift in what is considered rare. Occasionally, works previously considered rare are no longer thought to be so, having, perhaps, been discredited in some way or having been added to the rare book collection in error. Far more common, however, is for works previously considered mainstream to be shifted into the category of rare books. New subjects become popular for

collectors, making previously unsought volumes more desirable, thereby increasing their value and making it more likely that they should be segregated. Because much of the decision making on segregating rare volumes is done on the basis of hindsight (i.e., identifying volumes that have already been deemed rare) the greatest challenge comes in recognizing what will constitute the next generation of rare books. This is a difficult—some would say impossible—task.

WHERE ARE RARE BOOK COLLECTIONS FOUND?

Generally speaking, rare book collections exist either as private collections owned by individuals or as institutional collections (or departments within institutional collections) in a variety of settings. Within these settings, collections of rare books can be of almost any extent, depending on the size and scope of the parent institution, the means through which the rare books were originally acquired (i.e., through purchase or as the result of the donation of a large discrete collection), and whether there is in place a program for the ongoing expansion of the rare book collection. Among the institutions in which significant rare book collections are likely to be found are national libraries, university libraries, public libraries, museum libraries, the libraries of learned societies, occasional special libraries, and independent research libraries.

National libraries invariably will have some form of rare book collection, as well as other special collections, generally quite large and with a depth that makes them of great importance as research collections. Not infrequently, significant parts of these rare book collections originated in the donation of important private collections. The British Library (<http://www.bl.uk>), for example, has been the recipient of numerous fine collections, including those of both King George II and King George III. The National Széchényi Library of Hungary (<http://www.oszk.hu/eng>), takes its name from the fact that it was founded with the collections of Count Ferenc Széchényi, and in the United States, the Library of Congress (<http://www.loc.gov>), was reformed after its destruction in the War of 1812, with the personal collection of Thomas Jefferson. Many more examples exist.

Colleges and universities have traditionally been the sites of a broad variety of special collections, including rare book collections, in part because they exist to promote scholarship and learning but also because they are the natural beneficiaries of the largesse of alumni collectors. Major rare book collections are to be found in most great universities, although occasionally these are actually independent research libraries that are affiliated with the university. Some of the most important rare book collections in the United States (and elsewhere) are to be found in university settings, including the Beinecke Rare Book

and Manuscript Library at Yale University (<http://www.library.yale.edu/beinecke>), the Houghton Library at Harvard University (<http://hcl.harvard.edu/houghton>), the John Carter Brown Library at Brown University (http://www.brown.edu/Facilities/John_Carter_Brown_Library), the Lilly Library at Indiana University (<http://www.indiana.edu/~liblilly>), and the Bancroft Library at the University of California, Berkeley (<http://www.lib.berkeley.edu/BANC>), to name a few.

Significant rare book collections are also to be found in many large public libraries where, again, they have often originated as private collections and are maintained and expanded as a means of serving the scholarly community. At times, public libraries have benefited from the involuntary transfer of collections as well. In France, for example, many public municipal libraries throughout the country boast fine rare book collections, the result of the confiscation of private collections and the collections of religious institutions during the French Revolution and the redistribution of those collections to public libraries where they could be made available to all. In Russia, Eastern Europe, and many other areas, similar redistributions of collections from private to public hands have taken place, although the decline of Communism in some areas has led to the return of some collections to their original owners or their descendants.

Independent rare book libraries are generally based on the collection of a particular individual, who creates a foundation or similar apparatus for the purpose of continuing and maintaining the collection for the future. Many years ago, Randolph G. Adams referred to this as “the wistful desire of the collector, great or small, to want his collecting work preserved,” and further noted, “If a collector wants his scholarly work of collecting, as well as his books, conserved, he must look around and find, or erect, an institution in which that can be done.”^[2] In this way, private collections built over the course of a lifetime can be retained unaltered or even expanded. A few examples of such independent rare book and research libraries include the Pierpont Morgan Library in New York City (<http://www.morganlibrary.org>), the Folger Shakespeare Library in Washington, D.C. (<http://www.folger.edu>), the Huntington Library in San Marino, California (http://www.huntington.org/LibraryDiv/Library_Home.html), and the Bibliotheca Bodmeriana, near Geneva, Switzerland (http://www.ville.ge.ch/geneve/culture/offre_culturelle/musees/musees_ca/bodmer/bodmer.html).

Although the above represents some of the types of institutions in which large and significant rare book collections are likely to be found, the fact is that small collections of rare books may be found in almost any institution with a library. Individual volumes or small collections of value and significance may be donated to smaller libraries, sometimes because donors believe that these “lesser” donations would simply be lost in a major library setting. Such donations can be problematic for an

institution not prepared to deal with them adequately, and some small libraries will choose to sell rare book gifts rather than face the issue of properly securing, housing, and preserving them while making them available for use. Such a decision is problematic at best, because it ensures that the library will not be considered for donations—small or large—in the future.

A DELICATE BALANCE

Although the owners of personal collections of rare books may or may not make their collections available to the public as they see fit, those who work with public or quasi-public collections face an odd dilemma. There are two major responsibilities that rare book librarians face in their role as stewards of these collections, and, unfortunately, these responsibilities can sometimes be in direct conflict. Collections must be made available for use, and at the same time, care must be taken to ensure that delicate, and often unique, materials are preserved to ensure their availability in the future as well. The difficulty of this dichotomy may best be understood if we try to imagine a museum in which visitors are permitted to handle the exhibitions while curators are charged with ensuring that the objects remain intact for future use. To be sure, rare books are not simply museum objects; they are important for their content as well, yet they have much to tell of a nontextual nature (through paper, bindings, ink, endpapers, etc.), and this involves their being preserved in as close to their original state as possible. No matter how open one may wish to make access to rare books (and this desire differs greatly from country to country and from institution to institution), the fact remains that use and preservation are conflicting goals, and therein lies the quandary that stands at the core of rare book collections.

The variety of settings in which rare book collections are found makes it difficult to generalize about how such collections are handled, but it can be said that in virtually all rare book collections some restrictions on use are in place. Primary among these restrictions is that the materials consulted do not circulate. Also virtually universal are restrictions such as identification of readers, use only in a restricted and observable area, note taking only in pencil or using a laptop computer or personal digital assistant, and restricted photocopying. In some libraries, restrictions go well beyond these, and potential readers may be required to demonstrate a clear need to see the materials in question and to explain the purpose of their use—questions that would be anathema to most general collection users and librarians in countries that have a history of promoting open access to books and information in public or quasi-public hands.

The range of opinion on the efficacy of various restrictions on use is broad to say the least. At one end of the spectrum, we have those who say that serious restrictions

are necessary to ensure that materials will be available in the future and who posit that librarians who are not vigilant in applying such restrictions on the use of rare books are performing a disservice to their profession. At the opposite end, are some mavericks who claim that such restrictions are outdated and call for the open use of all library materials on more or less the same basis as general materials, particularly in academic settings. Librarians who do not allow such access—who squirrel away collections to preserve them for the future while restricting use by current readers—are, they say, marginalizing the importance of such collections and are making it more difficult to justify the ongoing expense of maintaining and expanding those collections. In other words, they too are charged with performing a disservice to their profession. As with most such issues, the best path seems to lie between the two extremes, with policies reviewed to ensure that restrictions are not more severe than necessary but with some restrictions remaining in place to ensure the preservation of materials for future use. The “delicate balance” between access and preservation must be maintained, but it must be truly in balance, swinging too far in neither direction.

GROWTH OF COLLECTIONS: PURCHASE

The growth of a personal collection of rare books relies solely on the desire of the owner. Where expansion takes place, it is almost always the result of a direct purchase of materials from antiquarian book dealers and/or auction houses. The relationship between collector and dealer has long been a strong one and a special one, and this is true whether the collector is an individual or an institution, for institutions also use purchase as one of the primary ways in which rare book collections are expanded. It is not unusual for individuals or institutions to establish close working relationships with one or more dealers, who are made familiar with collecting needs and who use their web of contacts and connections to meet those needs.

In recent years, another web—the Internet—has altered the way in which some individuals and institutions make purchases for their collections. In part, this involves the relative immediacy and ease of e-mail contact with dealers and the ability to peruse the web sites of individual dealers, on which they have listed some, if not all, of their holdings. Of greater significance, however, are the multidealer sites in which one can peruse the stock of an international array of hundreds or thousands of antiquarian and second-hand book dealers with a single query. In theory, such sites make it possible for a potential purchaser to see, together, numerous listings for the same title (assuming that it is available from more than one dealer) and to compare prices. Unfortunately, with little standardization in entries, comparisons are not always easy, because the amount and quality of information provided

differs from dealer to dealer. Nonetheless, with the Internet, determining the availability of an item—a process that could take days, weeks, or months in the past—and purchasing that item become issues that can be settled within seconds by just a few keystrokes.

The quantity of material listed is vast, but we must not assume that these listings will suddenly make it possible to find any item that one might desire for a collection. True rarities (i.e., items that exist in only a small number of copies, most of which already reside in institutional collections) will continue to be elusive. As Eric Holzenberg has written, “Although the Internet has certainly brought masses of hitherto obscure and unregarded material to light, and to some extent fostered a market for such material, traditionally scarce and desirable materials have not become more common: the Internet has not brought to light unrecorded copies of the Bay Psalm Book.”^[3]

Relationships with dealers will continue to be significant in the purchase of materials for rare book collections. The Internet—however, sophisticated it may become, and however successful may be attempts to impose standards on descriptions and condition statements to make them more useful—is still just a tool. Rare books cannot be purchased from the Internet. They are purchased from dealers who use the Internet as a means of reaching potential buyers in a more efficient way than through catalogs or storefronts alone. The number of dealers with whom a purchaser can interact is increased vastly through the Internet, and its use has already had a great effect on the ability to gather information on rare books and to make purchases. But for many purchasers, the establishment of a special relationship with a relatively small number of dealers will remain as another method for securing works to be purchased for rare book collections.

GROWTH OF COLLECTIONS: GIFTS

Purchase is not the only means by which rare book collections grow. Gifts are another major source of materials for collection development; indeed, in some cases, they may be the primary source of such materials. Gifts may be of money or they be in kind (i.e., gifts of individual rare books or rare book collections). Monetary gifts may—depending on the wishes of the donor—be used to expand a collection through purchase, as described above. Gifts in kind provide a more direct means of expanding collections, but there are issues involved in accepting such gifts.

Ideally, only unrestricted gifts (gifts that the library can accept and then is free to use or dispose of as it wishes) would be offered and accepted. The fact is, however, that potential gifts often come with at least some connected restrictions. Indeed, even when restrictions are not explicitly stated, it should be assumed that they exist. Most potential donors have at least a tacit understanding that

their donation will be added to the collection and preserved for the future. If this is not to be the case, it is important that the donor be so informed before the gift is accepted. Donors may agree to allow the sale of items that are not suitable for the collection to allow for the purchase of more fitting items. Nonetheless, they should be aware that such a sale, or the transfer of their gift to another institution, is a possibility (if, indeed, it is) before the gift is accepted.

When collections are offered, it is not unusual for there to be at least some explicitly stated restrictions. This is particularly true if the donor is the person who has amassed the collection. Such restrictions may be nothing more than desiring a plaque in the library, or having a collection shelved separately from other materials, or naming the collection for the donor. Sometimes, however, more onerous restrictions are included. In all cases, a determination must be made about whether the importance of the collection is such that restrictions will be accepted or if the donation should be refused. The latter is not an easy course to follow. It requires a great deal of tact and diplomacy, but under no circumstances should a gift be accepted with restrictions if there is no intention of adhering to them.

One useful tool in the gift process is a written gift policy. The gift policies of many libraries and special collections can be found on the Web. These can provide good examples and a framework for creating such a policy, though each institution's policy will need to reflect the specific needs of that collection. This should address such issues as the criteria that the library applies to the acceptance of gifts, the particular strengths of the collection, the areas in which the library is most seeking to expand the collection, the nature of unrestricted gifts and how they might be disposed of, and contact information for potential donors. Under no circumstances should the librarian, or anyone directly connected with the institution, which is to receive the gift, act as an appraiser. This must be done by the donor and at the expense of the donor to avoid the possibility of a conflict of interest.^[4] This also should be clearly stated in a gift policy.

With a clearly defined policy, gifts need not become the minefield that they sometimes do but, rather, can be a major means of allowing for the expansion of rare book collections. For most collections, purchase and gifts will be the two primary avenues of growth, but for collections that are part of a larger library, there is a third means through which this takes place, and that is through the transfer of materials, which previously have been part of the general collection.

GROWTH OF COLLECTIONS: TRANSFERS

Although the first two methods for expanding a collection involve the purchase or acceptance of books known to be

rare, this last involves the identification of materials that were not considered rare at the time they were acquired. The evolution of rarity is an ongoing process. Various factors cause the desirability of a certain work to grow, or this may happen as the result of the passage of time, the development of new scholarship, or the emergence of new fields. Accordingly, review of the general collection is called for on an ongoing basis. Unfortunately, this is a task that is extraordinarily labor intensive and ideally requires a level of expertise in the subject field involved as well as some expertise in rare books management. This alone makes it difficult or impossible for many libraries to undertake a comprehensive review and forces them to adopt alternative approaches.

For example, limited reviews can be undertaken for subject areas in which it is known that materials have greatly increased in value (i.e., desirability). It is also possible for records that are in machine-readable form to be scanned to locate those that meet a particular criterion or set of criteria. This is particularly useful in cases where books printed before a particular date are being sought, because such specific information is readily identified and isolated.

Alternatively, attempts can be made to educate general library staff about the types of materials that are likely to be candidates for transfer, in the hope that they will identify such materials in the course of the day-to-day operations of the general library. This also can be a daunting task, because there are numerous library operations during which such materials might come to light. These include circulation, cataloging, copy services, conservation, inter-library loan, exhibitions, shelf-reading, retrospective conversion, and weeding. In large libraries, the number of staff who would have to be trained could prove a stumbling block. Nonetheless, where it is possible for “consciousness raising” to be undertaken with general library staff, such staff can be an invaluable resource in identifying materials for possible transfer to the rare book collection or other special collections. In any event, no matter what method is undertaken, in a rare book collection, which is part of, or affiliated with, a larger general collection, it must be understood that there may well be important works worthy of transfer that are to be found in the general stacks.^[5]

DEACCESSIONING

The growth of collections, whether through purchase, gift, or transfer, is a vital factor in keeping such collections viable and active. There are times, however, when these ends can also be accomplished, in part, by the removal of certain materials from the collections. The deaccessioning of rare books is perfectly legitimate under certain circumstances. Most collections, no matter how focused they may be, end up with at least some materials that are

beyond the scope of the collection. In fact, the more focused the collection, the easier it is to identify such materials. In other cases, materials not previously out-of-scope may be deemed to be so if the institution has redefined its mission or focus to better serve users. To retain such materials would be a disservice, because they would no doubt receive the lowest priority in issues such as conservation or housing.

It is perfectly acceptable to deaccession materials under such circumstances, once it has been determined that to do so would not violate any prior agreements or restrictions that have been placed on such an activity by donors. If such restrictions are in place, legal action may be required before deaccessioning can take place, or it may simply be deemed unwise to pursue the issue. In any case, it should be kept in mind that the deaccessioning of materials—and especially rare materials—by a library is a process fraught with dangers and potential public relations disasters, and these should all be considered before a decision is made.

Efforts should always be made to ensure that those involved (and in public institutions that includes the public) are kept informed and are aware of the reasons for the deaccessioning, and the legitimacy of undertaking it as a means of strengthening the collection by eliminating materials marginal to the core mission of the library. Unfortunately, there may be times when institutions decide to sell all or part of their rare book collections to raise money for other purposes or to meet financial obligations in difficult economic times. This is a far less defensible undertaking and one that ensures only that the said institution will never again be considered to be the recipient of future largesse in this area. Nonetheless, it is a scenario that unfolds at times, particularly with institutions that have small rare book collections that have come largely as a result of gifts, rather than having been built through purchase. Having said that, when deaccessioning is done for the correct reasons and when it is handled properly, it can be a part of maintaining, and even strengthening, a viable rare book collection.

PROVIDING ACCESS POINTS

In any library, books are not simply acquired and placed on the shelves. In addition to the physical processing of the materials, they are analyzed or cataloged to provide access points that will enable potential readers to identify them when the need arises. Rare book collections are best served by specialized analysis and cataloging, which establishes standard access points describing content and publication while also offering detailed descriptive analysis of the books themselves. This recognizes that rare books are often studied as objects as well as for their content and that their physical attributes may be deemed significant to a scholar. Thus, the analysis of a rare book will often include access points for things such as

bindings, typography, illustration technique, paper, provenance, significant associations, inscriptions, marginalia, and any number of additional copy-specific identifiers, depending on the knowledge and skill of the cataloger and on the importance, which the institution places on such in-depth analysis.

Remote access to resources and records worldwide is becoming greatly enhanced by the conversion of library catalogs to on-line systems, digitization projects, and the power of the Internet and World Wide Web to assist in finding and sharing such information. Standards being developed, such as the Dublin Core set of machine-readable descriptors (<http://dublincore.org>) and Encoded Archival Description (EAD) Document Type Definition (DTD) (<http://lcweb.loc.gov/eadd>) address the uniform coding of metadata to facilitate Internet/WWW searching of information resources. Although these were not created with rare book collections in mind, metadata schemes such as Dublin Core and EAD have the potential, through standardization and rich description standards, to vastly increase the accessibility of information about materials in rare book collections.

ENVIRONMENTAL ISSUES

Although it is to be hoped that all library collections—general or rare—are housed in suitable environments, it would be naïve to assume that this is the case. Heat, light, and moisture are the primary enemies of books, and the control of these three elements is essential to the preservation of collections. Virtually all serious rare book collections address these and other environmental issues in determining proper housing for those collections. Smaller collections do what they can to provide a suitable environment, but all collections—personal and institutional regardless of size—should strive to meet certain basic criteria.

We have become aware, in recent years, of the problems inherent in the papers used in books printed after the mid-nineteenth century; papers made with wood pulp and chemicals react with moisture in the air and become brittle. The existence of this problem, undeniable though it may be, has become so all-consuming that it has led some to think that there are no problems with earlier books. This is decidedly not the case. All natural materials deteriorate, and books are made up of natural materials: paper, leather, cloth, vellum, parchment, ink, wood, sewing thread, glue; all of these elements of books are made (or have been made) of organic materials, which deteriorate over time.

Generally speaking, the lower the temperature the slower the deterioration, but it must also be kept in mind that rapid fluctuations of temperature are most damaging. It is usually accepted that temperatures of 68–72°F are best for books that are being kept in areas where people are also present, with temperatures as low as 60°F favored

for books that are kept in storage. Fluctuations of no more than 5° are considered acceptable.

Humidity, too, is a major factor in the deterioration of books, because fluctuations in moisture content cause natural materials to shrink and expand, thereby weakening their structure. For rare books, a relative humidity within the range of 40–55% is generally considered acceptable, although with both humidity and temperature, photographic materials have different requirements and should be dealt with separately from other rare books.

Everyone has seen the faded spines of books that have been on shelves where they are exposed to the sun. This is a clear demonstration of the destructive nature of ultraviolet light, and this same destructive nature is found in light that originates in sources other than the sun, such as fluorescent bulbs. If rooms with windows are used to house rare books, draperies or blinds should be used to eliminate direct sunlight, and ultraviolet filtered glass should also be considered. If rare books are in storage rooms, from which they are retrieved, lighting in these rooms should be activated on an “as-needed” basis and should not be kept on unnecessarily. Where fluorescent bulbs are used, steps should be taken to minimize ultraviolet exposure.

Other factors affect the deterioration of rare books and should be taken into account when deciding on storage and shelving options for such works. Glass or metal shelves that are properly treated to avoid harmful gases are generally preferable to wooden shelves. Air filters help to reduce the amount of dust and airborne particulates, which work their way into books and cause abrasion and other damage. Food, of course, should always be kept away from rare books, not only because of the direct damage that it might cause but because of the pests and vermin that it might attract. Mice, roaches, silverfish, and the like can cause major damage to rare books. We cannot eliminate all of the forces of decay, but we can minimize them, and if we cannot provide true immortality to our rare books, we should at least ensure that they last as long as possible.

SECURITY

Although not every rare book collection will be housed in a perfect environment, it is likely that virtually all rare book collections—where books that are recognized as rare have been segregated from the remainder of a larger collection or where rare books constitute the full collection—have been secured in some way. This may be anything from a small locked cabinet near the librarian’s desk to elaborate vaults in which the treasures of major rare book collections are protected. Both personal collections and institutional collections face problems with security. Because personal collections are not necessarily heavily used by other than the owner, some form of physical security for the collection as a whole may suffice (depending on the size and

value of the collection, more extensive measures may be required). In an institutional setting, however, there is always more to security than simply placing collections under lock and key.

Some of the previously mentioned restrictions that rare book libraries place on use are for security purposes. For example, identification of users and the use of rare materials only in specific areas and under observation by library staff are significant deterrents to theft. To assume, however, that any measure is completely reliable in preventing the theft of rare books from libraries would be foolish. Accordingly, any viable security program must address both the issue of prevention and the issue of recovery in the event of a theft.

If a theft occurs, the library must have means by which the stolen item or items can be identified. It has already been noted that the extensive analysis of a book is helpful to users in locating the specific work they need. Such detailed descriptive cataloging can also be useful in identifying stolen items. The inclusion in catalog records of unique, copy-specific identifiers can be most helpful. These would include such things as inscriptions, marginalia, extra illustrations, special bindings, or the presence of additional or tipped-in materials. The existence of such a detailed record can be a powerful tool in proving ownership should the need arise.

Copy-specific cataloging alone, however, is not sufficient, and other means are also used to establish ownership of specific materials. Generally, this includes one or more means of placing ownership markings on the book itself. Although curatorial practice frowns on any form of permanent marking, it is often seen as an acceptable compromise, given the difficulty of proving ownership of unmarked books. Bookplates alone are usually not considered sufficient, because they are readily removed. Markings should be permanent but should use archival materials. Special inks are available for this purpose, both commercially and—for U.S. libraries, archives, and museums—through the Library of Congress (<http://lcweb.loc.gov/preserv/inks.html>). Two types of markings are best used, one which is obvious and readily observable and another which is more difficult to detect. To maximize effectiveness, markings should be on a part of the book, the removal of which would significantly reduce the value of the book. This, again, is an issue that must be discussed with curatorial staff.

As with so many aspects of administering a rare book collection, it is best to have a written policy laying out guidelines for security and stating specific actions to be taken in the event of a theft. Security, though, involves more than protection from theft, it involves protection from damage as well. As with theft, preventive measures against damage are important, but it is equally important to be prepared in the event that damage threatens or actually occurs. To this end, a written disaster plan is essential.

Such a plan needs to address a broad range of issues relating both to disaster preparedness and to disaster response. Potential disasters may include fire, water damage (resulting from flood, leaks, or fire-fighting activities), earthquake, tornado, hurricane, physical collapse, and more. Because disasters, by their nature, require swift response, it is imperative that the plan be in place to ensure that decisions are not made under the pressure of the moment. The same is true of a good security plan. Hopefully, the reaction part of each will never have to be put into effect, but having these plans, being familiar with them, and ensuring that staff is also familiar with them and with the roles they are expected to play will go a long way toward guaranteeing the overall safety of the rare book collection, and ensuring that response—when needed—will be swift and proper. The website of the Rare Books and Manuscripts Section of the Association of College and Research Libraries (<http://www.rbms.nd.edu>) contains standards and guidelines relating to security and theft, as well as a variety of additional issues important to rare book collections. It also includes numerous links to relevant Internet sites of use to rare books librarians, scholars, and archivists. Among the topics covered are preservation issues, security, associations and organization, book dealers, digitization, newsletters and E-journals. Many of these, in turn, will lead to further links.

OUTREACH

As with most aspects of life, institutional support for the maintenance and expansion of rare book collections is cyclical in nature. In flush economic times, such support is more readily available than during an economic downturn. In addition, there are times when the intellectual pursuits supported by such collections are more highly valued than at other times. In periods in which support is difficult to come by, the administrators of rare book collections may be called on to justify the expense of these collections. It is unfortunate that concrete measurements, such as return on investment, are often considered inadequate to justify rare book collections, particularly when using the statistics most often quoted by libraries. There is no doubt that by normal standards of library use, rare book collections are expensive. The materials usually cost more to acquire than general library materials, they require specially trained staff and more exacting care and protection, and they are used less frequently than general collections. Research in the humanities and the social sciences—the type of research often supported by rare book collections—does not generally bring the kind of “break-through” or lifesaving results that scientific or medical research can yield and is, thereby, more likely to be questioned in terms of expense.

To counteract the difficulty that sometimes exists in presenting statistical justifications for rare book collections,

the administrators of such collections should not be shy about taking advantage of what one might call the “mystique of rare books.” There is a long history of rare book collections being seen as enhancing the prestige of the individual or institution to whom they belong. Particularly in academic settings, a rare book collection large enough and of sufficient depth to support research in a variety of subjects has often been thought to credentialize the institution and to demonstrate that the institution is able to provide the intellectual framework necessary for serious academic study and learning.

Another means of exploiting this mystique comes through various forms of outreach—methods for bringing rare books to the attention of the institution’s users and potential users and subtly educating them about the importance of these collections. This is most often accomplished through a schedule of some type of exhibitions, although other forms of outreach exist, including educational programs, publications, special events, and anything else that demonstrates to the collection’s “public” the significance of the materials to be found in that collection.

In recent years, another form of outreach has become possible. Through the technology of digitization, the content of some rare books can be made available to a vast audience via the World Wide Web. For many—particularly scholars and bibliographers—such images can never replace the actual object, nor are they meant to. But for those for whom the content of the rare book is more important than its artifactual presence, digitization offers a means of making the text available without causing additional wear to the original object each time it is examined. Although there are numerous issues involved in the issue of digitization, there seems little doubt that it adds one more potential tool to the outreach arsenal that rare book librarians will need to put into use to demonstrate the significance of their collections, in an effort to ensure the continued survival of those collections.

THE FUTURE OF RARE BOOK COLLECTIONS

Personal collections of rare books will exist as long as there are bibliophiles with sufficient disposable income to allow them to engage their passion for such collections. As the rarest materials find their way into institutional collections—and particularly large, wealthy institutional collections where they are likely to remain indefinitely—collectors may have to turn to “new” subjects on which to focus their collections. Incunabula in the traditional sense may no longer be a viable focus for one starting a collection on a limited budget, but the incunabula (i.e., the earliest books) of specific subjects may prove more attainable. Early writings on computers, television, the Internet, perhaps even the earliest e-books,

are likely someday to be the “stuff” of which rare book collections are made.

Although in the future, the actual hardware and software of our current technology may be the focus of collections of their own, at this point, they are tools—and increasingly important tools—in the maintenance and administration of rare book collections. Electronic and digital media allow for easy access to records; the Internet provides an additional source of acquisitions and also provides for the ready exchange of information on all aspects of rare books and collections; digitization offers a means of making rare materials available to a broader audience; technological advances even make it easier to control environmental issues. All of these technologies are going to continue to evolve, as will the effect that they will have on rare book collections, and new technologies are likely to emerge that will also have such an effect. Change is inevitable, not only with regard to technology but in relation to the overall concept of the rare book collection.

As that change occurs, specific rare book collections may not remain intact, and specific institutions or individuals may choose to divest themselves of these collections for a variety of reasons. In the case of institutions, those reasons are most frequently economic. Some smaller institutions may decide to divest themselves of collections that seem burdensome to maintain, with the materials dispersed through sale to larger institutions or to individuals. The collections of private individuals will continue to be offered for sale on a regular basis until such time as bibliophiles find a way to ensure that their heirs share their passion for rare books. The books from these collections—both personal and institutional—will not simply disappear. They will find their way, by purchase or as gifts, into other collections, again both personal and institutional.

Rare book collections in general are likely to exist for as long as there are those who understand the importance of preserving—both as objects and for content—materials that help to tell us about who we are, what we do, what we think, and why we think it. If those involved with rare book collections—whether as administrators, librarians, scholars, bibliophiles, or in any other capacity—help to spread such understanding, there is every reason to believe that these monuments to the endeavors of humanity throughout the centuries, these active and vital sources of knowledge, these essential aids to research, which are our rare book collections, will continue, effectively, forever.

Reading and Reading Acquisition

Brian Byrne

Discipline of Psychology, School of Behavioural, Cognitive and Social Sciences, University of New England, Armidale, New South Wales, Australia; Australian Research Council Centre of Excellence in Cognition and its Disorder, Australia; National Health and Medical Research Council Centre of Research Excellence in Twin Research, Australia

Abstract

The role of written language and therefore of reading in society and in the individual is examined. This is in part achieved by an examination of the historical emergence of writing systems, which in turn is used to suggest parallels with the acquisition of literacy by the child. The hypothesized parallels are tested against empirical evidence on the normal trajectory of reading acquisition. Failures of acquisition (developmental dyslexia) are also discussed. Turning attention to skilled reading, some abiding issues, such as speed reading, eye movements, and the role of “inner speech,” are canvassed. Modern computer-based models of reading are also introduced, models that are bringing the study of reading to new levels of scientific rigor and promise.

INTRODUCTION

Written language as an information source, with “reading” the name of the way we extract the information, is an integral part of the modern world. Instruments of social order (laws), agreements among individuals and groups (contracts), accumulated knowledge of the physical and social worlds (scholarship), and novels (creative works) are examples of the information and ideas stored and broadcast in written form. Thus writing and reading run deeply and broadly through modern social life. In this entry, I consider the status of written language in society and in the individual human mind. I trace how humans moved from oracy to literacy, considering as I do so the various solutions that have been adopted for how to record speech. I then draw some lessons from the history of writing for the processes that a child must go through in learning to read, and go on to summarize recent research on learning to read and on how this acquisition process might go awry. I then consider some of the salient features of skilled reading and the computer models being developed to account for those features. Among other goals, these models are being used to help illuminate why some children and adults remain so unskilled that their educational and economic opportunities are hampered.

THE LITERATE MIND

As pointed out earlier, the operation of many societies is now heavily dependent on print and reading—that much is beyond doubt. But we can also ask how profoundly written language influences the mind of the individual. How different would our processes of thought be without having a graphic form to capture spoken language?

One thing that we can assert with confidence is that mental operations that are close to the interface of written and spoken language are jointly shaped by both forms. The “interface” is where graphic symbols map onto the sound system of language (to be described in more detail later). We have clear evidence of tight integration of print and speech. For example, even though speech is the primary form of language for humans, both in evolutionary and ontogenetic terms, it can be shown that when literate people think about spoken words, they automatically (and often unconsciously) invoke the printed forms. Likewise, when literate people think about printed words, they invoke their spoken counterparts. Ask someone to tell you if there are more sounds in “pitch” than “rich” and chances are they will say “yes,” an erroneous response that shows that spelling, the addition of “t” in pitch, influences conceptions of pronunciation. This influence is evident early in children’s development as readers.^[1] In other classic findings, adults are slower to acknowledge rhyme in spoken pairs with different spelling patterns, like “make” and “ache,” than in pairs like “make” and “cake.”^[2] Adults are also slower to notice that words with similar spellings, like *paid* and *said*, do not rhyme than they are for words with different spellings, like *paid* and *head*.^[3] They are also slower to agree that *rough* and *cough* share a spelling pattern than they are for *rough* and *tough*, showing the influence of phonology (pronunciation) on judgments of orthography (spelling patterns). There is even (anecdotal) evidence that orthography can override phonology and the consequent link to meaning. A regional airline that serves my town is called Rex (a contraction of Regional Express). It is indeed fortunate for the airline’s proprietors that passengers do not “hear” another rendering of Rex, as “wrecks.” Finally, and at a more scientific level, compelling evidence for the obligatory invocation of orthography

in the mental machinery of literate people comes from the famous Stroop effect, whereby people asked to name the color of the ink in which a word is printed are massively disrupted if the word in question is itself the name of a color, such as when the word *green* is printed in red ink and the correct response is “red.” This automatic triggering of the reading response appears in children as young as first graders.^[1] All the evidence, then, points to a tight mental bond between speech and print, and to the easy facilitation of the act of reading even when it is not required, or worse, when it is actually disruptive.

So becoming literate alters mental operations. But how broad in scope are the effects of literacy in the mind? To get an answer to this question, we need to compare groups of people who are literate with those who are not but are in other ways similar, no easy assignment in the modern world with widespread literacy. But there are two well-known sets of studies that have achieved this goal, and the broad picture they paint is that being able to read and write does not have extensive effects on mental processes beyond the print–speech interface. A Belgian group has compared Portuguese-speaking adults who became literate later in life with some who have not had the advantage of reading and writing lessons, with both groups denied early literacy instruction for much the same reasons.^[4] The data are too extensive to do justice to here, but the overall picture is that becoming literate stimulates an awareness of the phonological structure of language, such as becoming aware of how many individual sounds make up a spoken word, and has positive effects on lexical (vocabulary) skills, probably through the very act of reading. But there is little direct effect on other linguistic capacities, or indeed on cognitive processing more generally.

The second study is the classic volume of Scribner and Cole.^[5] They studied the Vai people of Liberia, some of whom were unschooled, others literate in the Vai script, a syllabic one, and some in Arabic, an alphabet. The book is valuable on many levels, including its survey of the range of ideas concerning how, or whether, literacy “changes minds,” on methodological issues such as disentangling the effects of schooling from the effects of literacy per se, and its empirical results. Abbreviated summaries of such works never do justice to their contributions, but here are some of their own words: “Reading and writing the [Vai] script was associated with specific skills in synthesizing spoken Vai..., in using graphic symbols to represent language..., in using language as a means of instruction..., and in talking about correct Vai speech...” (p. 244). But “our results are in direct conflict with persistent claims that ‘deep psychological differences’ divide literate and nonliterate populations... On no task—logic, abstraction, memory, communication—did we find all illiterates performing at lower levels than all literates. Even on tasks closely related to script activities, such as reading or writing with pictures, some nonliterates did as well as those with school or literacy experiences” (p. 251).

Thus, the available evidence points to clear effects of becoming literate on mental processes relatively close to script, such as conceptualizing the sound structure of the language, and perhaps to some mental activities a little further removed from script, such as vocabulary enrichment through reading and the mechanics of teaching. But profound changes in human cognition do not seem to attend learning to read and write, despite the liberating consequences of having a substitute for oral memory in maintaining a society’s sense of itself and gaining the facility to communicate across space and time.

A final comment in this section: Presumably, the bonds between written and spoken language exhibited by skilled readers are built on what neuroscientists refer to as the massive interconnectivity of the human brain, with approximately 60 trillion synaptic connections in the cortex. But the fact that tight bonds between speech and print do form, and do so with only a year or two’s exposure to written language, does not mean that the two forms of language are cut from the same cloth. Indeed, all the evidence points to the primacy of speech over writing, and it is to this idea that we turn as we trace the development of literacy, within society and within the individual mind.

SPEECH AND WRITING

The human species is characteristically singled out not only for its intellectual powers but also for its language, the most complex and precise of all animal signaling systems. Note, however, that in evolutionary terms speech preceded writing by a vast margin, perhaps by as much as 100,000 years. Given the value of written language in modern societies, we can ask how humans got on so long and so well without it and why it took so long to emerge. We can also ask whether there are lessons to be learned from the historical emergence of writing and reading for the individual development of literacy in the child.

Preliterate Society

A society without literacy must, by definition, depend on oracy for the maintenance and transmission of laws, contracts, the accumulated knowledge of the physical and social world, and linguistic creations. At the core, feats of memorization needed to stand in place of written records, and they did. History sometimes affords opportunities to capture the changeover from oracy to literacy in mid-flight, as it were, and with thoughtful reconstruction, Ancient Greece presents us with one such opportunity. In his entertaining and scholarly treatise on the origins of the alphabet, Man^[6] summarizes a case for the first alphabetic works, Homer’s *Iliad* and *Odyssey*, being written versions of pre-existing recited epics. Man suggests that “they were more than after-dinner entertainment. They were works of

genius, designed to tell listeners where their roots lay and what made them what they were. To do this, they included vast amounts of information, so much that Eric Havelock called them ‘tribal encyclopaedias’” (p. 215). The tradition of “oral literature,” a term that could be applied to pre-Homeric recitations and to any number of modern equivalents such as the Balkan bards of the 1930s observed by Milman Parry,^[7] encompasses not only astounding acts of memory but degrees of improvisation set in an agreed metrical form. But once these performances were turned into writing, as began to happen as the alphabet took hold of Greek society, they became fixed. As Man puts it: “A living thing had been captured, and one world sacrificed to create another” (p. 228). The new world included what is now commonplace, the transmission of culture beyond the bounds of person-to-person contact.

Not everyone greeted this transformation with enthusiasm or even equanimity. Socrates famously objected to the emergence of writing on the grounds that it more or less froze language, drained the life out of words, and therefore doomed the dialog that was at the heart of the “examined life.”^[8] He also regretted what he saw as the destruction of memory, which in turn, by the discipline needed to build it, contributed to the examination of knowledge. And perhaps bizarrely to our conceptions of social opportunity, he saw writing as making knowledge available to people who were ill-prepared to use it appropriately. Maryanne Wolf’s entertaining account of the history (and science) of written language^[8] tells us that other scholars around the world had worries similar to Socrates, but that the advantages of the written word overcame these objections to see it spread worldwide.

The facility with which culture could be taught and preserved through face-to-face means, attested to in Greek and many other cultures, may itself have been a reason for the late emergence of script. The U.S. Census Bureau^[9] provides estimates of the world’s population at various points of time, and at 8000 BC, before anything recognizable as writing existed, estimates put the number of people on earth at 5 million. Scattered across Africa, Europe, Asia and the Americas, this allows for groupings of modest size, within the limit suggested by Aristotle as the ideal maximum of about 5,000 citizens (or 25,000 people) that could be “addressed by a single herald.”^[6] Population growth remained slow over the next 4000 years, reaching perhaps 7 million in 4000 BC, but increased to 14 million just a 1000 years later and 50 million by 1000 BC. These latter years were periods of high activity in the development of writing systems, perhaps no coincidence as pressure built for other means of preserving social identity with larger numbers aggregating in single locations.

Another reason for the long period of human history in which people spoke but did not write may have been human psychology in the sense of what comes naturally to human consciousness and what does not. We will return

to this theme in more detail when we consider theories of reading acquisition, but a sense of what is meant emerges already in the historical development of writing systems, to which we now briefly turn.

The Emergence of Writing

There are several classic and more recent sources on the history and comparative natures of writing systems, and readers are referred to two under Bibliography. Here, we consider aspects of the developmental progression that might illuminate the act of reading, and in particular its acquisition.

Sampson^[10] provides the classification of writing systems of Fig. 1. The division between semasiographic and glottographic captures the difference between the direct versus language-mediated representation of ideas. Universal symbols valuable for the tourist trade, such as signs for male and female toilets, passport control, bus stations, taxi ranks, and the like, can be understood by people unfamiliar with the language of the country. They are not always entirely transparent in meaning, as a veridical painting would be, because their interpretations do depend on a degree of enculturation—a picture of a stylized woman could in principle signal many affordances other than toilet facilities, and when it comes to a red bar across an object depicted in a red circle, such as a cigarette, the social learning involved is considerable. But systems that were basically semasiographic did exist, and, as the aforementioned examples demonstrate, still do as elements of communication.

The distinction between direct and language-mediated representation of ideas is a broad-brush one in the context of more-or-less pictorial signs versus ones that stand for speech. But it is a distinction that appears in finer form within glottographic systems for they too vary in how directly the graphic elements map onto units of meaning.

Fig. 1 Sampson’s analysis of writing forms. Dashed lines represent forms whose inclusion as writing is open to doubt.

Source: From Byrne,^[11] Figure 2.1, p. 28.

In a logographic system, should one exist in pure form, the graphic elements stand in for the words of the language, with no lower-level correspondences. To illustrate, consider logographic elements of English such as &, \$, =, and the numbers, 3, 14, 26 (versus three, fourteen, twenty-six). These symbols appear in running text, but only as elements that do not decompose into a more basic currency of representation—thus, while *and* represents the three phonemes of the word “and,” & does not. Nor do we typically think of them as standing for “sounds.” If we did, as Sampson points out, we might be happy to accept *&rew* and *l&* for “Andrew” and “land.” So such symbols are close to meaning in the sense that they represent the words of a language and not its sounds.

Phonographic systems do stand in for sound, and the phonology of language offers several possible sites for mapping graphic symbols onto phonological constituents. Fig. 1 shows syllables (basically a vowel surrounded optionally by one or more consonants), segments (or more commonly, phonemes, the individual vowels and consonants), and features (the building blocks of phonemes, such as the place in the vocal tract where an occlusion occurs in producing a consonant, the height and position of the tongue in producing a vowel). (We will not consider feature-based systems further except to note that features form part of the basis of the Pittman shorthand, and that the Japanese syllabaries represent the voicing feature with diacritics; other manifestations are very rare.) The election to use syllables or phonemes is probably not an arbitrary one available for languages on a whim. Some languages, like English, have a high number of syllables because they permit complex syllables, ones with several consonants on either margin of the vowel, like “strand.” Others, like Japanese, are more or less restricted to single consonant-vowel sequences, like “ma,” with consequently a modest number of total syllables possible. Hence, assuming each syllable gets its own grapheme, one would need thousands for English but less than 200 for Japanese.

As units of sound, syllables are no closer to meaning than are phonemes. But there appears to be a psychological difference in their accessibility to consciousness. There is a substantial research tradition demonstrating that young children can detect rhyme, a syllabic property of words, well before they can detect shared phonemes across words. Thus a child can tell you that “hot” and “pot” rhyme well before they can tell you that “hot” and “cat” end with the same phoneme, or even that “hot” and “hip” start the same.^[11]

It appears therefore that humans possess a hierarchy of self-awareness about language. It proceeds from meaning to words to sound, and within sound, from the large-scale units of syllables to the small-scale ones of phonemes. This hierarchy matches the historic development of writing systems. The earliest graphic systems, those of the Sumerians and Egyptians which were flourishing around 4000 BC, were close to meaning in that they initially

employed pictorial representations. With time, and with the demands of transcription by stylus into wet clay, the symbols became stylized, the pictorial origins obscured. At the same time, and with the aid of insights from the rebus principle, the new logographic signs came to represent first the words (rather than their meanings) and then fragments of the words’ sounds, typically syllables. Syllabic writing gave way to phonemic in the supportive linguistic context of the Semitic language of the Phoenicians, where vowels were fairly predictable from the consonantal frames and the contextual support of meaning, so that symbols needed to stand for consonants only. The Greeks, perhaps around 800 BC, adopted the Phoenician consonantal alphabet. They also adapted it to a language where vowels were not conditioned by the words’ meanings-in-context, and so where vowels needed their own symbols. A mismatch in phonology between the languages also meant that there were “spare” signs, such as the first Phoenician letter, alep, which stood for the glottal stop, absent in Greek. It became the letter for the vowel “a.” Thus was born the complete alphabet, wrought to represent the full range of phonemes, a device that spread from that beginning to become the modal writing system around the globe.

Gleitman and Rozin^[12] neatly capture the psychological progression that this history embodies:

The history of writing... involves the use of successively more analytic units of language to correspond to the squiggles on the page (or rock). Change has always been in this direction: from the representation of ideas or meanings, to the representation of words and morphemes, thence to syllables, and then to the smaller alphabetic units of vowels and consonants... popularly called phonemes. No revisionists are recorded in history. Nostalgia for bygone scripts and more global units has been absent from the history of writing... (p. 21).

Not that all modern systems are alphabetic. Chinese, for instance, uses characters that basically stand in for the morphemes of the language, though semantics and phonetics figure in the design of the characters through radical-phonetic compounds (see Fig. 2 for examples). Japanese employs characters, originating with Chinese, along with two forms of syllabary.

Finally, within alphabets, different languages vary in how consistently they represent the phonology of the language. English is notorious for its unruly nature, with such historical relics as *debt* and *knight*, and traces of the dominance of meaning over sound with such features as the use of “s” to represent the plurals of both *cats* and *dogs*, even though the last sound in “dogs” is “z” and we have a perfectly good letter for that sound. Finnish is an example of a highly regular script, largely with one letter for one sound, and French is an intermediate case. These comparative properties also have implications for the course of reading acquisition, as described later.

Character based on a pictograph:

羊 pronounced *yáng*, means sheep

Some characters that share the same phonetic:

蚱 insect radical 虫 with *yang* phonetic 羊: pronounced *yáng*, means “a kind of Weevil found in rice, etc”

養 eating radical 食 with *yang* phonetic 羊: pronounced *yǎng*, means raise (livestock, children, flowers etc)

洋 water radical 氵 with *yang* phonetic 羊: pronounced *yáng*, means ocean

氧 gas radical 气 with *yang* phonetic 羊: pronounced *yǎng*, means oxygen

痒 sickness radical 疒 with *yang* phonetic 羊: pronounced *yǎng*, means to itch

Some characters that share the same radical:

洋 water radical 氵 with *yang* phonetic 羊: pronounced *yáng*, means ocean

汗 water radical 氵 with *gan* phonetic 干: pronounced *hàn*, means sweat

淌 water radical 氵 with *shang* phonetic 尚: pronounced *tǎng*, means drip or shed tears

油 water radical 氵 with *you* phonetic 由: pronounced *yóu*, means oil

海 water radical 氵 with *měi* as phonetic: pronounced *hǎi*, means sea

湖 water radical 氵 with *hu* phonetic 胡: pronounced *hú*, means lake

河 water radical 氵 with *ke* phonetic 可: pronounced *hé*, means river

Notes:

1. Not all Chinese characters are of the “radical + phonetic compound” character type. There are also ideographs, simple and compound pictographs, borrowings, etc.

2. Both the radical and the phonetic component are guides only; sometimes the connection between the radical and the character’s meaning is obscure; and sometimes geographical and historical variation mean that the phonetic component is quite far removed from the pronunciation of a character in present-day Mandarin.

Fig. 2 Examples showing components of Chinese radical-phonetic compound character types.

LEARNING TO READ

Lessons from the History of Writing

Following is a series of observations from the history of writing accompanied by implications for the child’s emergence as a reader, with supporting research where appropriate.

Observation 1: The long period of human existence prior to the emergence of written versions of language shows that humans by nature talk and listen but do not write and read. In contrast to speech, written language is an invention, not an inheritance. Thus, a child will not know, by nature, that written language is possible. This needs to be taught. Parents who encourage their children to understand that print tracks speech are doing the

children a service, laying a foundation for the growth of literacy.

Observation 2: Humans have invented several ways to write. Thus, when children do come to understand that language can be written, it cannot be assumed that they know how their language is written. This, too, needs to be taught, as evidence under Observations 3, 4, and 5 indicates.

Observation 3: Writing progressed, historically, from direct representation of meaning, pictorially based symbols, to indirect representation, language-based symbols. This progression may re-occur within the individual. The celebrated Mexican educationist, Emilia Ferreiro,^[13] observed children who think that when one reads, one “reads” the pictures. A child’s early attempts to write are often replete with pictographic elements, such as choosing to use a lot of letters to represent a large object like an elephant, and few to represent a small object like an ant, even when the words’ lengths are the opposite (in Hebrew elephant is *pil* and ant is *nemala*^[14]).

Observation 4: Glottographic systems first developed as representing the meaning units of words and morphemes. Once children accept that writing is language-based, they may assume that symbols stand in for elements of meaning, not sound. The present author^[15] conducted experiments in which preliterate children, aged four and five, were taught to discriminate printed word pairs like *small* and *smaller* and associate them with the spoken forms. The young “readers” could correctly select which said “cold” and which said “colder” when challenged with a new pair (cold and colder) that preserved the morphemic relation of an adjective with its comparative. But with pairs in which the “er” represented a sound, not a morpheme, like *corn* and *corner*, they failed. That is, in learning that the letter group “er” discriminated the two training words, the children’s focus was on its morphemic, not phonological, value.

The failure to understand the phonographic nature of writing can undermine reading growth, as self-reports from adults suffering from marked reading disability attest.^[16]

I had learned symbols. . . 1 and 2 and 3. . . so I wanted that for five-letter words. . . I had this idea that. . . I was going to know just by looking. . . But there’s no way you could possibly take all the words in the dictionary and just learn them by sight (p. 157).

This man believed that written words were related to their speech counterparts just as numerals are related to theirs, as unanalyzed wholes. His hypothesis obviously remained entrenched long enough for him to abandon that way of learning, but for one reason or another, he could not replace it with the more systematic alphabetic method.

Observation 5: The alphabet was the last writing system to appear, and has only been invented once, following

a long period in which syllables were the speech unit of choice. We might conclude from this that syllables are more prominent linguistic objects and that the insight into the organization of the speech stream necessary for the alphabet’s invention does not come readily to the human mind.

Two kinds of evidence support the idea that these aspects of history duplicate themselves in reading and writing development in the child. The first is that children’s initial guesses about phonographic script appear to be syllabic. Once children abandon the idea that a single letter can stand for an entire word, their next strategy is to use as many letters as there are syllables in a word.^[13]

The second kind of evidence is the voluminous research on what has come to be termed phonemic awareness. Starting with work cited earlier,^[11] which showed that children are sensitive to the large-scale phonological unit of the syllable before the small-scale one of the phoneme, an overwhelming case has been made for the importance of the child’s grasp of how speech is composed of segments, like the three in “and” or the four in “mist.” This understanding is tested in a variety of ways, such as asking children to affirm that “mist” and “man” begin the same, or to say “fall” without saying “f.” Preliterate children are generally incapable of succeeding with such assignments. Phonemic awareness as a variable measured on the cusp of learning to read predicts later reading growth, and measured during childhood and even adulthood correlates substantially with reading skill^[11]).

A theoretical basis for the difficulty in becoming aware of the phonemic structure of the speech stream has been offered by speech scientists at the Haskins Speech Laboratories in New Haven. Starting with the observation that individual phonemes are integrated into words by a process known as coarticulation, such that the identity of each “sound” is smeared across the word rather than appearing as a discrete block of acoustic energy (see Fig. 3 for an example), Liberman and Liberman draw out the consequences for perception as follows:^[17]

Coarticulation. . . folds into a single segment of sound information about several successive phonemes. . . This produces a very complex relation between the sounds and the phonological structure it conveys, but this considerable complication causes the listener no trouble; he or she has only to listen, for the phonological specialisation parses the signal automatically recovering the several coarticulated gestures that produced it. . . Given the automaticity of that specialization, the constituent phonemes do not ordinarily rise to the level of consciousness (p. 351).

This account, built on the motor theory of speech perception, so named because under it the true units of speech perception are the motoric gestures that produce speech, is advanced as explaining how we can be expert talkers and listeners without needing to be consciously aware of the

Fig. 3 Spectrogram of the word “man.” Time is on the horizontal axis, frequency is on the vertical axis. The dark horizontal bars show concentrations of energy at particular frequencies.

phonemes that, linguistically, are the units from which words are constructed. Thus the child needs to have the existence of these units brought to conscious attention if they are to make sense of an orthography that exploits them, namely an alphabet.

Two other lines of evidence support the phonemic awareness hypothesis: One is that adults who have grown up without having been taught to read an alphabet are normally unable to perform tasks that reveal phonemic awareness such as deleting a phoneme from a word.^[4] The second is that instruction designed to foster phonemic awareness in preliterate children has been shown in turn to foster early reading development, and indeed to leave traces of a reading advantage well into middle school.^[18]

BEYOND THE ALPHABETIC PRINCIPLE

There is more to becoming a skilled reader in an alphabetical language than understanding the alphabetic principle and learning letter-sound mappings. That allows one to compute the pronunciation of printed words by blending the individual phonemes represented by the letters into whole words, as in “f” + “i” + “g” = “fig.” But if that were all there was to it, reading would be a very tedious business. Further, users of highly consistent languages, such as Finnish, would all be perfectly adequate readers, yet they are not. (As an aside, there is evidence that during the formative stages of reading development, linguistic

consistency is a variable that affects progress. For example, one estimate has it that English-speaking children need nearly twice as many years of learning to establish basic decoding functions as do readers of other European languages.^[19] What is needed beyond basic decoding, for all readers, is a high degree of automaticity in the ability to recognize the words on a page such that reading speed can rise to a level where the reader can understand the text without diverting their energies into laborious decoding. At this level of skill, for example, a person should be able to read number words like *three* and *forty* as rapidly as 3 and 40. This facility comes with increasing exposure to written words, although some children require more exposure to reach an appropriate level than do others, and it now appears that this difference among learners has a partial genetic basis.^[20] We return to the genetics of reading acquisition later.

Much of the available research on the growth of “sight word reading,” as this kind of automatized reading is often called, is summarized by Ehri,^[1] who distills the evidence into a coherent and appealing theory of the phases children go through in achieving mature levels. They are, in brief: the pre-alphabetic phase, in which a child will form connections between print and words that are arbitrary, often based on some prominent feature of the print sequence, such as the large M in McDonalds; the partial alphabetic phase, in which a child can use some alphabetic knowledge to link print and speech, such as the names of letters to create spellings like LFN for “elephant”; the full alphabetic phase, in which the child can exploit letter knowledge to fully decode new words; the consolidated alphabetic phase, corresponding to what was described earlier as skilled reading, where words are recognized more or less as wholes, or if too long for that, on the basis of familiar sequences such as ing, str, and est.

Failures of the basic insight into the nature of alphabetic script, leading to low levels of accuracy in decoding letter sequences, and failures to achieve automaticity, leading to accurate but slow word identification, are presented as two causes of reading disability in the double-deficit model.^[21] Wolf and colleagues identified verbal fluency, the speed at which a child or adult can reel off the names of a sequence of repeated items such as pictures of familiar objects, as a marker of the ability underlying the development of automaticity, and one separate from decoding skill. If decoding accuracy and automaticity are indeed governed by partially independent processes, we can see how there could be marked reading disability in highly consistent languages like Finnish, where accuracy is barely an issue, even in young children.

It should be emphasized that the issue of reading growth and reading disability across different languages is more complex than suggested so far. For one thing, it appears that there is a common core of cognitive deficiencies present to some degree in children suffering dyslexia

whatever their language; deficits in phonological awareness, verbal short-term memory, and verbal fluency.^[22] Despite this, there may be differences, such that, for example, children taught to read Chinese by rote may depend more on visual abilities than children learning alphabetic languages. But, as Caravolas says, “the study of dyslexia in languages other than English is relatively recent, and many questions remain.”^[22]

INDIVIDUAL DIFFERENCES

The Role of Genes

In discussing dyslexia, the focus has shifted from factors that are at work in learners of literacy in general, which I have argued are mirrored in the historical emergence of writing systems, to factors that generate differences among learners in how well and/or how quickly they master the skill of reading. Here the elephant in the room is genetics. Whether one contemplates cases of severe reading difficulties or variation among readers in speed and/or accuracy of reading within what could be called the “normal range,” genetic differences play a major role. We know this largely from the study of twins, who are informative when it comes to distinguishing between environmental and genetic factors in determining variation in human traits. In the case of reading, this distinction is necessary because reading difficulties “run in families,” and families share both environments and genes. Insofar as genes are the major determining factor, identical twins, who share the same genetic code, will be more alike than fraternal twins, who share, on average, half their segregating genes (genes that make people different). Statistical estimates of the role of genes from twin studies suggest that they contribute around 50–80% of the variability in reading skill, including the propensity for severe reading problems, with family-based and individual experiences contributing the rest of the variability. There are accessible and economic summaries of this research.^[23,24]

Some of the genes that affect literacy growth have been tentatively identified, and a recent summary is available.^[25] But relatively little is known about the paths from DNA to variability in reading, making the search for these paths a vital one for the future.

The Role of the Environment

The facts that learners bring their own genetic endowment to the task of learning to read and that these endowments are important do not mean that teaching practices are unimportant. If some new and revolutionary method of instruction were found that lifted the average reading performance by 50% but still left differences among readers, then genes would probably determine most of those remaining differences. Apart from this matter of principle,

evidence indicates that early and intensive intervention to prevent and/or overcome reading problems can be effective for many if not all children.^[18] This intervention often includes explicit training to foster phonemic awareness and the alphabetic principle. But evidence is accumulating that an early boost does not routinely translate into effective long-term improvement, and researchers are beginning to highlight the need for longer-term support designed to encourage children to keep engaging in reading.^[26]

Differences among children in learning to read can thus be attributed to teaching practices to a degree, though apparently less convincingly than to genetic variability. They can also be attributed to some extent to the home and/or aspects of the school environment, which in twin research forms part of what is called “shared environment” because twins share the home and, for the most part, the school. In one such study, estimates of shared environment on tests of literacy skills in Grade 2 ranged from just 0.03 to 0.07, meaning that between 3% and 7% of the variability among children could be attributed to variability in factors that come under the heading of shared environment, such as home literacy and school attended.^[27] Other research has put these estimates higher, especially where literacy instruction is quite varied within an educational jurisdiction; to put it the opposite way, genetic variation matters more when environmental variation is restricted through more uniform teaching practices.^[28] Some of the effective aspects of the (modest) home environment influences are understood, such as the practice of engaging the child while reading to him or her, but so far these factors have not been fully elucidated.

Differences in Comprehension: Reading and “Higher” Language Processes

The goal of reading is not to pronounce the words on the page but to understand the meaning of the text. If a child fails to understand something he or she is reading, the problem may lie not in printed word identification but in the language itself. That is, failure might also attend just listening to the same words—there may be deficiencies in vocabulary, in parsing the words syntactically, in concentrating long enough to extract the gist, and so on. The interplay of printed word identification (call it D for decoding) and more general language processes (call it L for listening comprehension) is neatly captured in the Simple View of Reading,^[29] which has at its heart the formula $R(\text{reading comprehension}) = D \times L$. This multiplicative relationship between the more mechanistic aspects of reading and the “higher-level” linguistic aspects has proven to be robust in the face of substantial research.

Differences in semantic and syntactic processes are beyond the scope of this essay. However, reading researchers are alive to the need to integrate the investigation of the factors contributing to decoding with those

contributing to higher levels of language in order to build up a complete picture of the psychology of reading.

SKILLED READING

Some Perennial Questions

Eye movements

I took a speed-reading course and read *War and Peace* in twenty minutes. It involves Russia.

—Woody Allen

This celebrated quotation successfully lampoons extreme claims about speed reading. There are, however, people who class themselves as speed readers, and who may read at a rate of around 600–700 words per minute, about twice as high as “normal” skilled readers. When they are studied in detail, it appears that these readers are capable of extracting the gist of text but rather poor at answering questions of detail, particularly in regions of text that they had not fixated. Normal readers asked to “skim” text exhibit eye movements and comprehension patterns similar to speed readers, so there appears to be no great mystery about, and no great feats involved in, speed reading.^[30]

Eye movements in reading have been studied extensively. In reading English, skilled adults tend to fixate on a place in the text for about a quarter of a second, to fixate on most words (94 fixations per 100 words), and to regress (move their eyes back) around 14% of total eye movements. In a single fixation readers can process around 3–4 letters to the left of the fixation point and up to 15 to the right, although in Hebrew, which is read right to left, the asymmetry is reversed. In Chinese, where each character contains more information than each letter in an alphabet, the span is around 1 and 3 characters from fixation. Foveal vision, where acuity is high, subtends about 2° of visual angle, the parafovea extending out about 5° on either side of fixation point. Some information is gained from the letters included in the parafoveal range, though the further out in the periphery the less information—mostly just word length.

Between fixations, eye movements, known as saccades, suppress visual information. They tend to occur across 7–8 letter spaces on average (though with a large range of 1 to around 25 letters), and take between 20 and 40 ms (thousandths of a second). When words are skipped, they are mostly function words (articles, prepositions, and the like) rather than content words (nouns, verbs, adjectives), because function words tend to be shorter and more predictable.

During literacy development, fixation duration, number of fixations per 100 words, and proportion of regressions all drop with increasing age and therefore reading skill, as

would be expected. Abnormal patterns of eye movements can be observed in dyslexia (longer and more frequent fixations, shorter saccades, and more regressions), but these appear to be more a consequence than a cause of reading disability as the dyslexic person struggles with word identification and text comprehension. For a recent, extended summary of much of this eye movement research, see Rayner et al.^[31]

Phonology and reading

Another abiding issue is whether during reading the progression is from print to inner speech to meaning, or if meaning can be accessed directly from print. For 100 years imaginative experimental techniques have been created and harnessed to support either the mediated or direct accounts of word recognition from print, with no compelling conclusion. Most recently, the question has been finessed to some extent by the proposal that in skilled readers orthography, phonology, and semantics (word meanings) are integrated into a fully interactive system, with automatic feedback among them once one is activated (e.g., orthography by the act of reading, or phonology by the act of listening). The massive interconnectivity of the human brain, mentioned previously, allows for such a system to develop. If this is an accurate description of how things work, then it is not a matter of a causal chain in one direction (e.g., orthography to phonology to meaning) but an almost simultaneous activation of all three systems. Empirical evidence indicates that this can happen very quickly, with the phonological code for a word coming into play within about 20 ms of seeing its printed form. Recall also the evidence presented earlier for the influence of spelling on conceptions of the sound of words (e.g., that there are more sounds in “pitch” than “rich”), evidence that is consistent with this multiple activation model. On the other side of the coin, there is evidence that reading aloud a word with multiple pronunciations, such as *tear*, is slower than reading one with a single pronunciation, such as *bear*, indicating that the existence of competing pronunciations interferes with reading the word aloud.^[32]

COMPUTER MODELS OF SKILLED READING

In much of modern psychology computers are being used to model human behavior, and reading is no exception. The goal of this endeavor is not to replace human with computer reading (though text-to-speech programs do have that facility), but to understand the act of reading better. There are several widely agreed virtues of trying to model reading with a computer program.^[33] First, a theory of how reading proceeds must be very explicit if it is to be successfully turned into a program—and trying to do so will expose any parts of the theory that are not sufficiently precise. Second, once such a program has been

written, its performance can be compared with that of humans, and adjusted to make it conform better if the match is poor. Third, as often happens, more than one simulation can be written that successfully mimics the behavior. This in turn should stimulate more refined descriptions of the behavior so that the models can be adjudicated.

Another advantage is that variation in reading skill can be modeled to test ideas about the origins of reading disability, including developmental dyslexia, encountered during reading acquisition, and acquired dyslexia, reading and spelling difficulties consequent upon brain injury or disease. Typically, this is accomplished by “damaging” one or more of the components of the models in ways that capture deficiencies hypothesized to underlie the acquired dyslexia in question and examining the new output for how faithfully it reproduces the reading profile of the dyslexic. For example, the models might be underpowered by reducing the number of “units” in the learning algorithm, or random noise might be added to mimic phonological imprecision.^[34]

In this short essay there is not the space to summarize and evaluate current models. Suffice it to say that models with different computational architectures have been developed and tested. Some are connectionist. In these, connections are physically real objects created in an attempt to be “biologically plausible” and in which neural-net learning algorithms are typically employed—see examples for English^[33] and French.^[35] Others are nonconnectionist. They use programming codes with symbolic rules but similarly attempt to achieve biological plausibility by, for example, having excitatory and inhibitory connections between elements, just as the nervous system does.^[33]

CONCLUSIONS

We began in prehistory and ended in the computer age. The uniting theme was literacy in human society and mind. Humans listened and talked before they read and wrote, and so do modern children. There are interesting parallels between the emergence of literate, historical societies and of literate, modern children such that the latter recapitulates the former. At the very least, the temporal primacy of spoken over written language at the social and personal levels should alert us to the fact that children are not born into literacy in the same way as they are born into speech, and that instruction needs to acknowledge this in practical ways.

Once literate, however, the structure of the human brain appears to guarantee a tight bond between written and spoken language, a bond which manifests itself primarily as mutual arousal of the two codes even in activities where only one is required. In normal reading, this bond serves the reader well, if for no other reason than that

mutual activation is fast, allowing reading to proceed with the efficiency and accuracy of speech. Modern models of reading exploit this bond, and are taking the study of reading to new levels, characterized by precision, testability, and clinical significance. Given the value of the skill of reading, and the personal and social burden of lacking it, continued scientific interest in the underlying biological and cognitive machinery can only be applauded.

ACKNOWLEDGMENTS

Helen Fraser, Richard Olson, and Jeff Siegel supplied helpful comments on a draft of this entry. Isabel Tasker created Fig. 2. I am grateful to all four.

Reading Disorders

H.L. Swanson

GSOE, University of California, Riverside, California, U.S.A.

Abstract

This entry summarizes current research on reading disorders. Historical trends along with the most recent perspectives on the definitions, subgroup classifications, and causes of the problems related to reading are reviewed. This entry also provides an analysis of interventions to improve reading skills and types of interventions resulting in successful outcomes. This entry concludes by examining the main issues in the field of reading disabilities.

INTRODUCTION

The goal of this entry is to review literature on reading disorders and problems associated with poor reading skills. First, the variety of terminology and definitions are examined and the current definitions of the disorder and the classifications are provided.

Next, a more detailed description of the processes involved in good reading and possible causes of problems in reading are explored. Among these potential causes are impairments associated with basic processes related to word recognition, language processes, naming speed, and memory. The neurological basis of reading problems and some possible genetic factors to account for reading deficits are also discussed. Then we proceed to examining various scientifically based interventions and factors that are related to successful intervention outcomes. Finally, the chapter concludes by reviewing controversial and problematic issues in the field of reading disabilities.

The term reading disorders has been used interchangeably in literature with the term dyslexia, learning-disabled readers, specific reading disabilities, learning disabilities in reading, learning disorders in reading, or reading disabilities. For simplicity, we will use the term reading disabilities. Children or adults with reading disabilities have an unexpected failure in reading, but otherwise possess average intelligence and motivation in schooling considered necessary for accurate fluent reading. Reading disabilities are among the most common neurological-based disorders affecting children with prevalence rates of 5%–10% in clinics and about 17% in unselected population-based samples.^[1] These incidence figures and the review of research reflected in this entry are primarily based on children who are having difficulty learning to read alphabetic language. There has been little consensus on the incidence of reading disabilities in nonalphabetic languages. Reading disabilities is a persistent chronic condition that does not represent a transient developmental

lag. Depending on the definition, the incidence of children with reading disabilities in special education classes is conservatively estimated to reflect 2%–5% of the public school population. It is also the largest category of children served within the context of the label learning disabilities, and children with learning disabilities are the largest diagnostic group of children served in special education.

By definition, children and adults classified as having reading disabilities are those individuals with normal intelligence, but who suffer mental information processing difficulties. Children or adults with reading disabilities are a subgroup of a larger diagnostic category known as learning disabilities. The terms are used interchangeably because approximately 80% of the intervention research on learning disabilities focuses on reading.^[2] Several definitions refer to reading disabilities as reflecting a heterogeneous group of individuals with “intrinsic” disorders that are manifested by specific difficulties in the acquisition and use of listening, speaking, reading, and writing. Most definitions of reading disabilities assume that the difficulties of such individuals are

1. *Not* due to inadequate opportunity to learn, to general intelligence, or to significant physical or emotional disorders, but to *basic* disorders in specific psychological processes (such as remembering the association between sounds and letters).
2. *Not* due to poor instruction, but to specific psychological processing problems. These problems have a neurological, constitutional, and/or biological base.
3. *Not* manifested in all aspects of learning. Such individuals’ psychological processing deficits depress only a limited aspect of academic behavior. For example, such individuals suffer problems in reading, but not necessarily arithmetic.

Before discussing the causes and issues related to reading disabilities, a brief historical review is necessary.

HISTORICAL TRENDS

In 1877, Kussmaul called attention to a disorder he referred to as word blindness, which was characterized as an inability to read, although vision, intellect, and speech were normal. Following Kussmaul's contribution, several cases of reading difficulties acquired by adults due to cerebral lesions, mostly involving the angular gyri of the left hemisphere, were reported (see Hinshelwood^[3] for a review). In one important case study, published by Morgan,^[4] a 14-year-old boy of normal intelligence had difficulty recalling letters of the alphabet. He also had difficulty recalling written words, which seemed to convey "no impression to this mind." That case study was important because word blindness did not appear to occur as a result of a cerebral lesion. After Morgan's description of this condition, designated as a specific reading disability, research was expanded to include children of normal intelligence who exhibited difficulties in reading. Hinshelwood's^[3] classic monograph presents a number of case studies describing reading disabilities in children of normal intelligence. On the basis of those observations, Hinshelwood inferred that reading problems of those children were related to a "pathological condition of the visual memory center" (p. 21).

Researchers from the 1900s to the 1940s generally viewed reading difficulties as being associated with structural damage to portions of the brain that supported visual memory (e.g., see Geschwind^[5] for a review; also see Monroe^[6]). A contrasting position was provided by Orton,^[7,8] who suggested that reading disabilities were reflective of a neurological maturational lag resulting from a delayed lateral cerebral dominance for language. Orton described the phenomenon of a selective loss or diminished capacity to remember words as strephosymbolia (twisted symbols). Orton^[8] noted that "although these children show many more errors of a wide variety of kinds it is clear that their difficulty is not in hearing and not in speech mechanism, but in recalling words previously heard again or used in speech, and that one of the outstanding obstacles to such recall is remembering all of the sounds in their proper order" (p. 147).

Orton stated that such children with reading disabilities had major difficulties in "recalling the printed word in terms of its spatial sequence of proper order in space" (p. 148). Thus, for Orton, reading difficulties in children with reading disabilities were seen as reflecting spatial sequences in visual memory or temporal sequences in auditory memory. However, it is important to note the conceptual foundation for much of Orton's research was challenged in the 1970s (see Vellutino).^[9] Today reading difficulties are viewed primarily as language problems and memory difficulties (e.g., see Stanovich and Siegel).^[10] Memory difficulties are popularly conceptualized in terms of difficulties in language processes.

SUBGROUPS OF READING DISABILITIES

The heterogeneity of performance of individuals with reading problems has led to some confusion in the field and has prompted researchers to theorize the existence of distinct subtypes of reading disabilities.^[11–13] In their recent examination of the current state and perspectives on learning disabilities, Fletcher et al.^[11] proposed the existence of three types of reading disability. The first type is associated with problems in word recognition and spelling. The second form refers to difficulties in reading comprehension. Finally, the third type includes individuals who experience difficulty in reading fluency and poor automaticity of word reading.

The largest number of students with reading disabilities demonstrates problems on word level recognition. It is the most common and best understood form of reading disability and is associated with deficits in phonological awareness (the ability to hear and manipulate sounds in words and understand the sound structure of language), automatized rapid naming, and verbal working memory. However, a subset of students with reading disabilities who have intact word recognition skills show deficits in reading comprehension. This type of disability is related to problems in oral language and working memory. (Working memory is the capacity to integrate new information with old information when high demands are made on attention.) Finally, a group of students with average word decoding skills differ in reading fluency. These individuals have average word recognition accuracy but a slow reading rate.

A prominent study by Morris and colleagues^[12] explored the variability of reading disability subtypes in a large group of 7–9-year-old children with reading problems. Based on the results of their study, several reading subtypes emerged: two subtypes without reading disability, five subtypes with specific reading disability, and two as "globally deficient," in the sense that performance across all measures was very low. Five specific reading disability subgroups varied with regard to phonological (working) memory and rapid naming. Six of the reading disability groups exhibited deficits in phonological awareness skills. The authors concluded that children with reading disabilities could be differentiated from the "garden variety" poor readers on the basis of their vocabulary level, which was in the average range for children with specific reading disabilities.

Overall, Morris and colleagues' work on subtyping reading disabilities is consistent with the phonological processing hypothesis, which postulates that problems in the phonological domain account for reading difficulties. These phonological problems either occur in isolation or co-occur with problems in other cognitive domains.

Other subtype studies tested whether good and poor readers could be differentiated on their performance on memory-related measures. For instance, Swanson^[13]

examined individual differences in several forms of memory of students with and without reading disabilities. Although several subgroups with different profiles emerged, the results indicated that children with reading disabilities had low performance on memory tasks not because of reading, but rather due to inefficient working memory. Swanson concluded that “connections between reading and WM operate on a continuum of independence to dependence as reading becomes more skilled” (p.327).

ADULTS WITH READING DISABILITIES

Reading disability persists through the life span, and children with reading disabilities grow up and become adults with reading disabilities. As these young adults transition to a new stage of their lives, they encounter new problems and challenges at home, at work, and in the community. In adulthood, the implications of having a reading problem are different and not that obvious. Unfortunately, the general population today is still unaware of the specifics of reading disability, and because it is “invisible,” the behavior of these individuals is often misinterpreted and not understood by people with whom they interact in the beyond-school world. Less research has been conducted with adults with reading disabilities than with school-age children and adolescents. The majority of research on adults with reading disabilities has focused largely on examining their social and emotional development, vocational training, transition to postsecondary education, and issues related to employment.

The Individuals with Disabilities Education Act of 2004 (IDEA 2004), the Americans with Disabilities Act (ADA), and Section 504 of the Rehabilitation Act define the rights of people with learning problems, including reading disability. Individuals with learning disabilities in reading are legally entitled to receive special services and appropriate instruction to help them cope with and overcome their learning problems and to adapt to the new environment. Such services may include workplace accommodations, extended time on tests and exams, or use and provision of assistive technology.

READING DISABILITIES AS A SUBCATEGORY OF LEARNING DISABILITIES

As mentioned earlier, a great deal of research on reading disabilities has been linked to a larger diagnostic category known as learning disabilities. The term learning disabilities was first coined in a speech by Samuel Kirk delivered in 1963 at the Chicago Conference on Children with Perceptual Handicaps. Clinical studies prior to 1963 showed that a group of children who suffered perceptual, memory, and attention difficulties related to their poor academic (i.e., reading) performance, but who were not intellectually

retarded, were not being adequately served in the educational context. Wiederholt,^[14] in reviewing the history of the learning disabilities field, said that its unique focus was on identifying and remediating specific psychological processing difficulties. Popular intervention approaches during the 1960s and 1970s focused on visual-motor, auditory sequencing, or visual perception training exercises. Several criticisms were directed at these particular interventions on methodological and theoretical grounds.

By the late 1970s, dissatisfaction with a processing orientation to remediation of learning disabilities, as well as the influence of federal regulations in the United States (Public Law 94-142), remediation programs focused primarily on teaching the basic skills of reading, such as phonics and sight word identification. The focus on basic skills rather than psychological processes was referred to as direct instruction. The mid-1980s witnessed a shift from the more remedial academic approach of teaching to instruction that included both basic skills in reading and cognitive strategies (ways to better learn new information and efficiently access information from long-term memory). Children with learning disabilities, primarily in the area of reading, were viewed as experiencing difficulty in “regulating” their learning performance, especially on reading comprehension tasks. An instructional emphasis was placed on teaching students to check, plan, monitor, test, revise, and evaluate their learning during their attempts to learn or solve problems.

The early 1990s witnessed a resurgence of direct instruction intervention studies, primarily influenced by reading research, which suggested that a primary focus of intervention should be directed to phonological skills. The rationale was that because a large majority of children with learning disabilities suffer problems in reading, some of these children’s reading problems are exacerbated due to a lack of systematic instruction in processes related to phonological awareness. This view gave rise to several interventions, which focused heavily on phonics instruction and intense individual one-to-one tutoring to improve children’s phonological awareness of word structures and sequences.

From the turn of the twenty-first century to the present, assessments of reading disabilities have been linked to intervention. A method of identifying school-aged students with reading disabilities known as response to intervention (RTI) first establishes low academic performance and then determines if a disability is present. The RTI model is partially based on intervention programs that have distinguished children experiencing academic difficulty due to instructional deficits from those with disability-related deficits.^[15] Federal regulations in the United States regarding the Individuals with Disabilities Education Act of 2004 have influenced the use of RTI by supporting a child’s response to scientific, research-based intervention as a process for learning disabilities identification. In general, the RTI model identifies whether a

student's current skill level is substantially lower than the instructional level (based on predetermined criteria: e.g., below the 25th percentile). Low academic performance is established using standardized, norm-referenced and/or curriculum-based measurements. After establishing low performance, empirically based interventions are implemented to determine if a disability is present. Student progress is monitored during the intervention. When a student does not respond to high quality intervention, the student may have a reading disability.

CAUSES OF READING DISABILITIES

Before discussing the possible causes of reading disabilities, it is necessary to highlight what good reading entails and some of the processes (when not operating properly) that may underlie or contribute to reading disabilities. Written words are symbolized representations of the spoken word. The ability to read depends on the acquisition of a variety of different types of knowledge and skills. Good reading ability assumes adequate language comprehension and fluent word identification. Most models of reading suggest that information is stored in our mind (referred to as coding) and can be transformed into units of spoken/written language. This stored information allows us to acquire information related to the spoken and written language. The storing and retrieving of language information is referred to as linguistic coding. Some aspects of linguistic coding involve speech codes or our ability to represent information in the form of words and word parts. This is referred to as phonological coding. There are other types of coding processes that are related to reading. Some of these codes relate to semantic coding that relates to our ability to store information about the meaning of concepts represented by words and word parts (e.g., -ing, -ed) and syntactic coding that is the ability to store word rules that set constraints on how words are organized in sentences. There is also pragmatic coding that is the ability to store information about conventions governing the use of language and how we communicate (in terms of changes in volume, pitch, intensity of spoken language). Linguistic and visual processes together also facilitate the establishment of associations of printed words. Visual coding refers to sensory or high level visualization processes that facilitate storage or representations of written words or graphic symbols.

Proficiency in reading would require the child to actively engage in all of the aforementioned coding processes. There is an "awareness" feature to the coding process, for example, *phonological awareness*, which refers to a child's ability to conceptually understand and have an explicit awareness of spoken words that consist of individual speech sounds (phonemes) and that are combinations of speech sounds (syllables). Such knowledge is viewed as very important in learning letters and converting the alphabet symbols to sounds. There is also *orthographic*

awareness, which refers to the child's sensitivity to how letters or words are organized.

Given all these particular coding process, several models of reading disabilities have emerged. Vellutino et al.^[16] provide an overview of research on specific reading disabilities across four decades. They conclude that adequate facility in word identification, due to basic deficits in phonological coding (converting written letters and words into sounds, skills of segmenting and blending sounds associated with letters—what is generally referred to as phonics knowledge), underlie reading disabilities. These deficits in phonological coding are defined as an inability to use speech codes to represent information in the form of words and parts of words. In short, these individuals have an inability to represent sound units in one's mind. Based on the review by Vellutino et al.,^[16] most cases of reading disabilities are due to phonological coding deficiencies rather than more basic deficits such as visual, semantic, and syntactic processing of information. There are some studies that have suggested that there may be some general language deficits in this population. Some of these general problems have been related to difficulties in attention, making association between sounds and visual shapes, processing verbal to auditory information or transfer, and working memory. We will briefly review some of the research programs that seek to determine the causes of reading disabilities.

Basic Processes Related to Word Recognition

Linda Siegel and her colleagues at the University of British Columbia have conducted several studies on basic processes related to reading disabilities (see Siegel and Mazabel,^[17] Siegel^[18] for a review). Her studies define reading disabilities in terms of word recognition skills that "all" children with reading problems have. A significant contribution of Siegel's program is her definition of reading disabilities. She suggests that the focus of definition should be at the reading recognition level and suggests that a cutoff below the 25th percentile or 20th percentile should contribute to the operationalization of reading disabilities. This work is based on the assumption that there is no reliable evidence to indicate that IQ plays a cognitive role in the development of reading skills. Reading-disabled children at all IQ levels have equal difficulty in phonological processing tasks, such as recognizing the visual forms of pseudo words, and pseudo word spelling. Work by Siegel indicates there are five possible processes that underlie the development of reading skills in the English language. These processes involve phonology, syntax, working memory, semantics, and orthography. Most of this research shows that difficulties in phonological processing are fundamental problems for children with reading disabilities, and these problems continue to adulthood. Three processes are critical in the analysis of reading disabilities: those related to phonological processing, syntax, and working memory.

Language Processes

Virginia Mann at the University of California at Irvine has focused on language processes and their relationship to reading disabilities (e.g., see Mann).^[19] Her studies on language processing skills and reading problems indicate that poor readers have problems with phonemic awareness, with morpheme awareness, and with three aspects of language skill: 1) speech perception under difficult listening conditions; 2) vocabulary, especially in terms of naming ability; and 3) use of the phonetic representation in linguistic short-term memory. Several of these process share a common core related to phonological coding, which concerns the sound pattern of language. Based on comparative studies (e.g., American and German instruction), her research suggests that awareness of phonemes is enhanced by methods of instruction that direct a child's attention to phonetic structures of words. Instructional experiences alone are not the only factors that account for failure to achieve phoneme awareness. Some other factors are related to speech perception (i.e., the awareness of rhyme), working memory, and problems with morphology.

Naming Speed

Several studies by Maryanne Wolf^[20,21] have found a connection between rapid naming of letters, numbers, and objects and reading disabilities. Slow naming speed marks a core deficit associated with reading disabilities. Her work has found strong relationships between rapid naming of letters and sound deletion (phonological awareness task). Rapid naming is associated not only with initial reading fluency but also whether there are any fluency gains after practice. Some research has investigated the role of rapid naming and reading achievement in languages other than English. The research suggests that slow naming speed is somewhat distinct from phonological awareness. Some of Wolf's work has focused on subtyping by strengths and weaknesses in rapid naming as well as phonological awareness. That research suggests a double deficit hypothesis, in which children can vary in terms of difficulty on phonological skills, rapid naming skills, or both of those skills. Georgiou and Parrila's^[22] comprehensive review of the research on rapid automatized naming (RAN) and reading suggests that the factors that underlie the connection are unclear. Some researchers have attributed RAN to the coordination of attention, perception, memory, and lexical processes, whereas others have viewed it as accessing phonological information in long-term memory.

Memory

Lee Swanson and his colleagues^[23] have researched reading disabilities by primarily focusing on short-term

memory, working memory, and their distinction. Deficits in reading comprehension and problem solving experienced by children with reading disabilities are related to memory problems in a speech-based storage system and/or memory problems related to specific aspects of a general executive system of working memory. The executive system focuses on the monitoring of information, focusing and switching attention, and activating representations from long-term memory. Problems in the executive system of children with reading disabilities are related to the inefficient mental allocation of attention and the poor inhibition of irrelevant information. Problems in executive processing are described in terms of limitations in attentional capacity rather than processing strategies. Because short-term memory has minimal application to complex academic tasks, the majority of his research on reading disabilities focuses on the relationship between working memory and complex cognition (reading comprehension, word problems).

Neurological Basis

Evidence from this neurological data suggests the disruption of the neurological system for language in individuals with reading disabilities.^[1] Brain-based research in reading disabilities has focused on the planum temporale, gyrus morphology of the perisylvian region, corpus callosum, and cortical abnormalities of the temporo-parietal region. Although at this point in time it is difficult to summarize this research, the neural biological codes believed to underlie cognitive deficits in the reading-disabled seemed to be centered on the left temporo-parietal region. Differences in the asymmetry of the planum temporale have consistently been found in association with reading disabilities. Specifically, asymmetry of the planum temporale is due to a larger right planum. A reversal of normal pattern of left greater than right asymmetry has been found in individuals with developmental dyslexia.

Recent studies by Sally Shaywitz and Bennett Shaywitz^[1] at Yale University have found differences in the temporo-parieto-occipital brain regions between reading-disabled and non-impaired readers. The converging evidence using functional brain imaging in adult reading-disabled readers shows a failure in the left hemisphere posterior brain system to function properly during reading. Some brain imaging studies show differences in brain activation in frontal regions in reading-disabled compared to non-impaired readers. The majority of this research has focused on the brain regions where previous research has implicated reading and language. The research shows clear activation patterns related to phonological analysis. For example, on non-word-rhyming tasks, reading-disabled readers experience a disruption of the posterior system that involves activation of the posterior superior temporal gyrus (also known as Wernicke's area, the

angular gyrus, and the striate cortex). The research demonstrates a persistent nature of a functional disruption in the left hemispheric neural systems and indicates that this disorder is lifelong.

Genetic Factors

Several studies have addressed genetic influences on reading disabilities. This research suggests that phonological coding abilities have a genetic etiology. The Colorado twin studies support the existence of major gene effects on reading disabilities, although the precise information about the mode of inheritance is less clear. Some of the literature (see Svensson et al.^[24] for a review) has found the localization of dyslexic gene sites (some of the gene sites have been attributed to chromosome 1, 2, 6, 15, and 18). Some research suggests that genes that contributed to nonword repetition also account for the genetic basis of memory span score. Petrill^[25] reviews recent research showing that both genetic and environmental influences are important in understanding reading disabilities. The presence of significant genetic factors among is viewed as a starting point for addressing some of the important theoretical questions concerning the genetic and environmental contributions to reading disabilities. Petrill discusses a fundamental issue referred to as the “missing heritability paradox.” He suggests that a considerable proportion of the genetic variants that influence learning disabilities (reading and math) may be genes that are infrequent within the particular population. Petrill’s research team suggests that there are multiple genetic pathways and routes through which abilities and disabilities emerge.

SCIENTIFICALLY BASED INTERVENTIONS

In the field of reading disabilities, the term treatment or intervention is defined as the direct manipulation (usually assigned at will by the experimenter) of variables (e.g., instruction) for the purposes of assessing learning: 1) efficiency; 2) accuracy; and 3) understanding. Swanson et al.^[2] have provided the most comprehensive analysis of the experimental intervention literature on learning disabilities, and specifically reading disabilities to date. Interventions were analyzed at three levels: general models of instruction, tactics used to convey information, and components that were most important to the instructional success.

In terms of general models, their synthesis of methodologically sound studies (those studies with well-defined control groups and clearly identified samples) found that positive outcomes in remediation reading were directly related to a combination of direct and strategic instructional models. These models included a graduated sequence of steps with multiple opportunities for learning over the content and skills, cumulative

review routines, mass practice, and teaching of all component skills to a level that showed mastery. The interventions involved: 1) teaching a few concepts and strategies in depth rather than superficially; 2) teaching students to monitor their performance; 3) teaching students when and where to use the strategy in order to enhance generalization; 4) teaching strategies as an integrated part of an existing curriculum, and 5) providing teaching that included a great deal of supervised student feedback and practice.

In terms of tactics, Swanson^[26] divided studies into eight models based on key instruction tactics: direct instruction (a focus on sequencing and segmentation of skills), explicit strategy training, monitoring (teaching children strategies), individualized and remedial tutoring, small interactive group instruction, teacher-indirect instruction (teacher makes use of homework and peers’ help for instruction), verbal questioning/attribution instruction (asking children key questions during the learning phase and whether they thought what they were learning would transfer), and technology (using computers to present concepts). The results indicated that explicit strategy instruction (explicit practice, elaboration, strategy cuing) and small group interactive settings best improved the magnitude of intervention outcomes. Explicit strategy instruction included two key components. One component included strategy cues. These studies included instructional components related to reminders to use strategies or multisteps, the teacher verbalizing steps or procedures to solve problems, and use of “think aloud” models. The other component of strategy instruction was elaboration. These studies included instructional components related to providing additional information or explanations about concepts and/or providing redundant text or repetition within text.

What makes an intervention effective regardless of its theoretical orientation or approach? Swanson^[26] analyzed interventions at the component level to address this question. He and his colleagues^[26] found that effective instructional models follow a *sequence of events*:

1. State the learning objectives and orient the students to what they will be learning and what performance will be expected of them.
2. Review the skills necessary to understand the concept.
3. Present the information, give examples, and demonstrate the concepts/materials.
4. Pose questions (probes) to students and assess their level of understanding and correct misconceptions.
5. Provide group instruction and independent practice. Give students an opportunity to demonstrate new skills and learn the new information on their own.
6. Assess performance and provide feedback. Review the independent work and give a quiz. Give feedback for correct answers and reteach skills if answers are incorrect.
7. Provide distributed practice and review.

They also found that some instructional components were far more important than others. For reading comprehension, those key instructional components that contributed in significantly improving the magnitude of outcomes were as follows:

1. *Directed response/questioning*: Interventions related to dialectic or Socratic teaching, the teacher directing students to ask questions, the teacher and a student or students engaging in reciprocal dialog.
2. *Control difficulty or processing demands of a task*: Interventions that included short activities, level of difficulty controlled, teacher providing necessary assistance, teacher providing simplified demonstration, tasks sequenced from easy to difficult, and/or task analysis.
3. *Elaboration*: Interventions that included additional information or explanation provided about concepts, procedures or steps, and/or redundant text or repetition within text.
4. *Modeling by the teacher of steps*: Interventions that included modeling by the teacher in terms of demonstration of processes and/or steps the students are to follow to solve the problem.
5. *Small group instruction*: Interventions that included descriptions about instruction in a small group and/or verbal interaction occurring in a small group with students and/or teacher.
6. *Strategy cues*: Interventions that included reminders to use strategies or multisteps, use of “think aloud models,” and/or teacher presenting the benefits of strategy use or procedures.

In contrast, the important instructional components that increased the effect sizes for word recognition were the following:

1. *Sequencing*: Interventions included a focus on breaking down the task, fading of prompts or cues, sequencing short activities, and/or using step-by-step prompts.
2. *Segmentation*: Interventions included a focus on breaking down the targeted skill into smaller units, breaking into component parts, segmenting and/or synthesizing component parts.
3. *Advanced organizers*: Interventions included a focus on directing children to look over material prior to instruction, directing children to focus on particular information, providing prior information about a task, and/or the teacher stating objectives of instruction prior to commencing.

The importance of these findings is that only a few components from a broad array of activities were found to enhance intervention outcomes.

Two very important instructional components emerged in Swanson’s analysis of interventions for children with

reading disabilities. One component was explicit practice that included activities related to distributed review and practice, repeated practice, sequenced reviews, daily feedback, and/or weekly reviews. The other component was advanced organizers that included: 1) directing children to focus on a specific material or information prior to instruction; 2) directing children about task concepts or events before beginning; and/or 3) the teacher stating the objectives of the instruction.

Issues in the Field of Reading Disabilities

Fundamental problems of definition have severely affected the field of reading disabilities within the public school context. This is because considerable latitude exists among psychologists in defining reading disabilities. This latitude is influenced by social/political trends as well as nonoperational definitions of reading problems. The field of study is further exacerbated because the number of individuals classified with reading disabilities has increased dramatically over the last twenty years. Unfortunately, without reliable and valid definitions of reading disabilities, very little progress in terms of theory development will emerge.

A related impediment to advances in the field is whether students with reading disabilities perform any different than low achievers. Traditionally, studies that have studied children with reading disabilities have relied primarily on uncovering a significant discrepancy between achievement in a particular academic domain and general intellectual ability. The implicit assumption for using discrepancy scores is that individuals who experience reading problems, unaccompanied by a low IQ, are distinct in cognitive processing from slow or low achievers. This assumption is equivocal. A plethora of studies have compared children with discrepancies between IQ and reading with children who are nondiscrepantly defined poor achievers (i.e., children whose IQ scores are in the same low range as their reading scores). These studies found that the two groups were more similar in processing difficulties than different.^[27,28] As a result, some researchers state that current procedures to identify children with reading disabilities are invalid.^[29] They have suggested dropping the requirement of average intelligence, in favor of a view where children with reading problems are best conceptualized as existing at the extreme end of a continuum from poor to good readers. In addition, some researchers have argued that IQ is irrelevant to the definition of reading disabilities and that poor readers share similar cognitive deficits, irrespective of general cognitive abilities.

In contrast to the argument that children with reading disabilities look no different than other poor readers in cognitive functioning or intervention outcome, Hoskyn and Swanson^[27] found in a synthesis of the literature that although children with reading disabilities and poor readers share some deficits in phonological processing and

automaticity (naming speed), performance by children with reading disabilities was superior to poor readers on measures of syntactic knowledge, lexical knowledge, and spatial ability. Another important finding was that cognitive differences between the two ability groups were more obvious in the earlier grades. Perhaps more important, Swanson and Hoskyn^[30] found that students with reading disabilities and low achievers differed in the magnitude of their responsiveness to intervention. After reviewing several intervention studies, the results showed that students who had low reading scores (25th percentile) but average IQ scores were less responsive to interventions than children whose reading and IQ scores were in the same low range (25th percentile) (also see Swanson and Hoskyn,^[31] pp. 300–301).

One of the practical difficulties within the field is that students who are identified by a political notion of reading disabilities have very little resemblance to the description offered within the scientific discipline. Thus, in contrast to the arguments presented related to the validity of reading disabilities as a field, most researchers who study the processing difficulties of children with reading disabilities do not use the discrepancy criteria. The majority of researchers rely on cutoff scores on standardized measures that are above a certain criterion of general intelligence measures (e.g., standard score > 85) and cutoff scores below a certain criterion (standard score < 85) on primary academic domains (e.g., reading or mathematics). Researchers distinguish individuals with reading disabilities from other general handicapping conditions, such as mental retardation and visual and hearing impairments. Further specification is made that socioeconomic status, being bilingual, and conventional instructional opportunity do not account for depressed achievement scores. Such specification allows the scientists to infer that the learning problems are intrinsic to the individual.

CONCLUSION

Children and adults with reading disabilities have normal intelligence but have difficulties in phonological processing, syntax, and working memory. These problems manifest themselves by poor performance on word recognition and reading comprehension tasks. Poor performance is defined as reading scores below at least the 25th percentile on a norm-referenced reading test. There is a biological basis to reading disabilities that causes lifelong difficulties in reading. Effective intervention programs focus on the explicit teaching of word recognition and comprehension skills.

Reading Interests

Catherine Sheldrick Ross

Faculty of Information and Media Studies, University of Western Ontario, London, Ontario, Canada

Abstract

“Reading interests” refers variously to the following: an individual’s interest in doing reading itself, as demonstrated by the amount of actual reading done; what a reader wants to read “about” as expressed by a list of topics or subject areas or genres that the reader reads by preference; or the elements in a text, sometimes referred to as appeal factors, that engage a particular reader with a text. Apart from examining bestseller lists and circulation records, two of the most direct ways to find out about reading interests are to ask the readers themselves and to ask the writers who have demonstrated their ability to interest readers by writing popular, bestselling books. Research on reading interests foregrounds the individual reader, whose interests, choices, tastes, reading behaviors, reading competencies, opportunities, frustrations, and pleasures in reading are given a starring role.

INTRODUCTION

Like the related terms “reading habits” and “reading motivation,” the term “reading interests” has the appearance of a stable trait—reading interests shows up in the titles of numerous research studies and has achieved the status of subject descriptor in indexes. Depending on who is asking the question, reading interests refers variously to the following: an individual’s interest in doing reading itself, as measured by the amount of reading actually done; what a reader wants to read “about” as expressed by a list of topics or subject areas or genres that the reader reads by preference; or the elements within a text, sometimes referred to as “appeal factors,” that engage a particular reader with a text. Reading comprehension, though a different concept, is nevertheless related to reading interests. Whatever else it may mean, reading interest entails a necessary element of engagement, as the reader makes meaning from the black marks on the page.

Apart from examining bestseller lists and circulation records, two of the most direct ways to find out about reading interests are to ask the readers themselves and to ask the writers who have demonstrated their ability to interest readers by writing popular, bestselling books. Wilkie Collins, friend of Charles Dickens and popular nineteenth century novelist, said that the secret was to “Make ‘em cry, make ‘em laugh, make ‘em wait.” By the early 1970s, there was already a substantial body of scholarship on reading interests summarized in Alan Purves and Richard Beach’s *Literature and the Reader*. Purves and Beach^[1] sort research on reading interests into three categories: 1) the reading interests themselves, which are broken down to include “interests in content, interests in form, amount of reading and interests, book difficulty and interests, and literary quality and interests; 2) personal

determinants of interests which are taken to be “age, sex, intelligence, reading ability, attitude, and psychological needs”; and 3) institutional determination of interests which are taken to be “availability of books, socioeconomic and ethnic determinants, peer, parent, and teacher influences, and television and movies as determinants.”

On examination, concepts such as reading interests/habits/attitudes/motivation/choices/preferences are hard to pin down and hard to distinguish. One thing we can say is that research on reading interests and cognate areas foregrounds the individual reader, whose interests, choices, tastes, reading behaviors, reading competencies, opportunities, frustrations, and pleasures in reading are given a starring role. In a nutshell, this field of research is reader-centered, in contrast with text-centered approaches that focus on the literary work or with structural approaches that focus on the social milieu in which the text is produced, distributed, taken up, and used. It puts the spotlight on reading itself within the broader communication circuit that includes the text, the author, the publisher, bookstores, and libraries, as well as social and technological factors such as copyright regimes, censorship, educational institutions, and technologies of printing and distribution.^[2] It privileges the cognitive and emotional responses of readers themselves and pays special attention to voluntary reading rather than to required or assigned reading. It is interested in the “why” and “how” of reading as well as in the “who” and “what.”

Why be concerned about reading interests? One answer lies in the link between reading interests, literacy acquisition and the demands for enhanced literacy in citizens of knowledge-based economies and societies. From studies of literacy acquisition, we know that readers learn to read by doing a lot of reading.^[3] And what keeps beginning readers reading through the thousands and thousands of

hours it takes to become a practiced reader? It's the pleasure of the experience itself—what some researchers call “intrinsic motivation.” So in the field of education and literacy studies as well as in the field of librarianship, there is the desire to know what factors motivate people to want to read, help them acquire the reading habit, and keep them reading across the lifespan. The term reading interests points to a key question: what kinds of reading materials/types of stories/kinds of experiences give people sufficient pleasure that they choose to continue reading rather than put the reading material down in favor of some competing activity?

But almost from the beginning reading interests turned out to be a surprisingly complex phenomenon to tease out from other factors and pin down. In the first heyday of library-based, scientific studies of reading, centered at the Graduate Library School at the University of Chicago in the 1930s under the leadership of Douglas Waples, reading interests tended to be thought of as something that preexisted—a causal factor that preceded reading. Researchers asked people to indicate their interests from a set of topics such as history, biology, economics, politics, government, personal hygiene, etc. that could be satisfied by reading nonfiction books on the topic^[4] and that therefore predicted (or ought to predict) reading choices. In more recent reading research, especially in the field of Library and Information Science, reading interest is more apt to be seen as the positive engagement that occurs during a reading transaction when there is an appropriate match between reader and text. This appropriate match often involves a number of intersecting considerations, including the amount of background knowledge needed by the reader to comprehend the text. It turns out that for some readers, the topic is key—there are readers who will read almost anything written about flying or about cooking or about sailing. But for many others, topic turns out to be one factor among many, some others being the feel of the book (upbeat and life-affirming or ironic and critical), pacing (a quick read or a dense, detailed text), setting (similar to the reader's everyday experience or very different), and the demands on the reader made by the language and literary conventions used.^[5]

While studies of reading interests foreground the active role of the reader in making choices and acting on preferences, it has also been recognized for a long time that there is an interplay between the interests and choices of individual readers and the availability of reading material that reaches readers through the various gatekeeping channels provided by intermediaries—e.g., publishers' choices of what to publish and later to advertise as well as the decisions of bookstores and libraries of what to stock and make available. As early as the 1930s, landmark studies by Douglas Waples and Leon A. Carnovsky explored the relationship between expressed reading interests and actual reading as part of a larger research agenda on reading and libraries summarized helpfully by

Stephen Karetzky.^[6] Carnovsky's *Library Quarterly* article, “A Study of the Relationship Between Reading Interest and Actual Reading,”^[7] for example, reports that book readers tend to read most in areas in which they have previously reported most interest, but only when such books are as accessible, as well-advertised, and as readable as other books. In other words, availability and accessibility can trump interest.

RESEARCH APPROACHES TO STUDYING READING INTERESTS

A problem for researchers of course is that reading interests cannot be observed directly. They can, however, be inferred from what people *say* about reading in letters, diaries, and Web-postings and in response to surveys, questionnaires, and interviews as well as from what they *do* through their book-buying, book-borrowing, and participation in book clubs and reading groups. Each of these research approaches is partial and has its own limitations. Bestseller lists and circulation statistics tell us what is sold or borrowed, not what is read or how it is read. Autobiographies, diaries, letters, and to some extent even marginalia are composed with an audience in mind of future readers by whom the writer hopes to be viewed in a favorable light. Small case studies based on interviews or ethnographic observation of individual readers may be idiosyncratic and not representative of general patterns. Large scale questionnaires using national samples are generalizable but tell us only about averages and not about any actual reader. Nevertheless, taken together, a growing body of research using different research methods from different disciplines, including education, sociology, history, psychology, literary history, and library and information science has achieved considerable understanding of the reading interests of readers of the past and present.

Historians and literary scholars have taken the lead in studying readers from periods before the twentieth century. Literary historians have paid most attention to the reading interests of elite readers, in particular of canonical authors. They examine these authors' texts for evidence of literary borrowings and verbal echoes and they track down the books held in authors' personal libraries in the hope of finding underlinings of significant passages and marginalia indicating reader response. Bibliophile Nicholas A. Basbanes^[8] has written entertainingly on studies that examine the “silent witnesses” to reading provided by library collections such as Leon Edel and Adeline R. Tintner's *The Library of Henry James*^[9] or that focus on marginalia, such as the six volumes of Coleridge's marginalia published as part of a Princeton University Press project to publish all of Coleridge's writings.

The burgeoning field of history of the book, or “*histoire du livre*,” has expanded our understanding of the reading interests and experiences of ordinary readers from various

historical periods and geographical areas. In her introduction to a theme issue in *Library Quarterly* on retrieving the reading experiences of ordinary readers by means of library records, Christine Pawley^[10] observed, "Still, some readers are more difficult to recover than others. Especially hard to access are the reading choices and practices of millions of 'common readers,' those with relatively anonymous lives and whom archival collections tend to ignore." Using census records, library catalogs and circulation records, subscription lists, estate inventories, advertisements, printing and transportation records, autobiographies, diaries, letters and other traces, book historians have tried to recreate a detailed picture of the what and how of reading of people in various different times and places. A notable example is William Gilmore's *Reading Becomes a Necessity of Life*,^[11] which examines transformations in reading in rural New England from 1780 to 1835, as reading materials in the home grew from a Bible and Farmers' Almanac to an expanded mix of newspapers, periodicals and books, including fiction. Readers' letters to authors and to publishers have also proved a fruitful source of evidence of reading experience and reception. For example, Robert Darnton^[12] reconstructed the Rousseauistic reading of Jean Ranson, an eighteenth century provincial French merchant, by examining his letters to the Société Typographique de Neufchâtel, a Swiss publisher of French books. Similarly, James Smith Allen's study^[13] of fiction reading in France was based in part on voluminous archives of letters sent by a privileged readership of acquaintances to 10 French authors.

Marginalia has proved an unexpectedly rich resource for investigating ordinary reading. Cathy Davidson's account of nineteenth century American novel readers was based, among other sources, on the marginalia inscribed in copies of early American novels. About well-used books, she notes, "Broken boards, turned-down pages, and abounding marginalia . . . reveal patterns of reading, patterns of use, the surviving traces of an interpretive community long-since gone" through which "some of the early readers remain surprisingly vivid even after nearly two centuries."^[14] English Professor Heather Jackson, in particular, has been a seeker-out of marginalia of all kinds, by exceptional celebrated readers and by common anonymous readers alike. An editor of the Coleridge project, she confesses, "Coleridge's marginalia converted me to writing in books."^[15] In *Marginalia*, she examined some 3000 books annotated in English by various readers from 1700 to 2000 and made the claim that marginalia can contribute to the history of reading by revealing codes of reading of the period as well as by recovering the experiences of individual readers.

As we move to the twentieth century, an expanded array of research methods has become available to investigate contemporary reading interests. Using tools developed for surveys and polling, a large body of work focuses on the *what* of reading interests, often with the help of checklists,

reading inventories, or questionnaires. Survey research uncovers broad patterns by correlating various aspects of reading (amount of reading in various formats, preferred genres, reasons for reading, and source of reading materials) with demographic variables of sex, age, educational level, or occupational group. In contrast, ethnographic research based on in-depth interviews or case studies of individual readers provide a fine-grained picture of reading interests in the context of the reader's life. A notable example is Janice Radway's *Reading the Romance*, which used a combination of individual and group interviews and questionnaires to understand the reading experiences of romance readers. Although the term reading interests is nowhere to be found in the index, the entire book in fact explores the special satisfaction that romance reading provides to romance fans. Radway says, "This theme of romance reading as a special gift a woman gives herself dominated most of the interviews."^[16] Also using interviews with readers, in *Children Talk About Books*,^[17] Donald Fry presents vivid case studies of six child readers as the grounded starting point for discussing familiar themes relating to reading interests: why readers choose to repeat the experience through many rereadings of a favorite book; the role of strong topical interest in motivating a reader to stretch beyond his usual comfort level; the attraction of series books such as those by Enid Blyton; the enjoyment of story; the popularity of genre fiction such as horror stories; and the move from children's fiction into adult books.

Talking to actual readers, rather than generalizing from one's own experience, is especially important in the case of children and young adults. As Holly Virginia Blackford notes in *Out of this World*:^[18] "How children themselves produce meaning is a particularly crucial area of study because child readers are, by definition, colonial subjects of a genre that is controlled by layers of adults and adult institutions (writers, publishers, marketers, critics, bookstores, libraries, educators, parents, and producers and marketers of commercial products and multimedia adaptations)." Blackford herself interviewed 33 girls, ages 8–16, from California and New Jersey, expecting to find that young female readers do identity work by reading fictional representations of characters like themselves and identifying with the protagonists. To her surprise, she found that despite "differences in race, class, age, family circumstances, reading preferences, and reading abilities, the girls' reading practices reveal a consistent pattern. They read for a good story, and a good story means one that they are *not* living—that actually looks *nothing* like the life they know."^[18]

From an accumulating body of research, certain generalizations have been robust. Almost everyone in westernized countries *can* read—95% or more of young adults are proficient at basic reading tasks;^[19] the problem is that too few readers are proficient at the more demanding reading tasks that are increasingly required in a knowledge-based society. Despite widespread belief that literacy skills are

falling from some earlier golden age of reading, performance on literacy tests tell a different story. For example, the Canadian *Reading the Future*^[20] found that there is an enormous improvement in literacy for those educated after World War II in comparison with those who completed their education before the war. Studies conducted over the last 50 years have been remarkably consistent in showing that the vast majority of the population reads something, about half the population reads books, and about 10–15% are avid readers. Occupation group and educational level are more important than age when it comes to predicting whether or not a person is a book reader. Younger people tend to read more than those over age 50; college-educated people and people with higher annual incomes tend to read more than those without a college education or with lower incomes; whites read more than nonwhites.^[21]

Gender makes a difference at all ages: girls and women have reading histories different from those of boys and men. Researchers report that from as young as 2 years old boys and girls display different preferences, with boys preferring scary fairytales and girls preferring romantic ones—preferences that extended into adulthood where men read more westerns, adventure, and science fiction and women read more romance. Boys enjoy information books, humor, action stories, and science fiction, with Harry Potter books enjoying phenomenal success, even among those who normally don't enjoy reading.^[22] Summarizing research on gender and literacy, Smith and Wilhelm^[23] note, among other things, that girls understand narrative texts and most expository texts significantly better than boys do; that boys value reading as an activity less than do girls; and significantly more boys than girls call themselves nonreaders. To build guy-friendly school library collections, Patrick Jones and his colleagues^[24] recommend spending a little less on novels and investing in magazines, graphic novels, comics, joke books, newspapers, books with colored illustrations, and nonfiction in areas of high interest such as sports, vehicles, etc. On average, girls learn to read sooner than boys and with more facility; they read more and they are more apt than boys to report that they enjoy reading for pleasure. As school age readers get older, there is a steady decline in the percentages of both boys and girls who say they enjoy reading and do it voluntarily for fun, with an accelerated drop-off around age 12 or 13. Among adult readers, women read more than men, particularly more fiction. Women are much more likely than men to belong to reading groups or book clubs: Jenny Hartley found that about 65% of reading groups are women, 28% mixed, and 6% men only.^[25] Elizabeth Long's booklength study of white women's reading groups in Houston, Texas^[26] suggests that, for these women, reading is fundamentally a social activity and book club participation a way of reflecting on the meaning of their lives in relation to others.

Reading preferences are idiosyncratic and individualistic, emerging from what Ruth Strang^[27] has called “a central core or radix” that determines any individual's

pattern of reading. Popular fiction, particularly detective fiction/mystery, science fiction/fantasy, and romance, accounts for a large proportion of what people say they like reading as well as what they actually do buy and borrow. An interest in reading materials is positioned within a larger network of media consumption and for many readers is stimulated or reinforced by tie-ins with comics, music, movies, television, or videogames.^[28] Readers develop an awareness of popular literary genres by paying attention to the craft of storytelling across media, learning how, say, fantasy works by experiencing instances of the fantasy genre in books, films, television shows, and videogames.^[29] Although we may think of reading as a solitary activity, social elements are powerful influences. Relationships with family, teachers, and friends are important factors in fostering reading and in influencing what materials are read.^[30] Studies of reading interests of students of all ages repeatedly have found a disconnect between reader interests and the traditional canon entrenched in the high school literature curriculum in U.S. schools^[31,32] where *To Kill a Mockingbird*, *Huckleberry Finn* and *The Scarlet Letter* remain common choices. Not surprisingly, readers are more likely to find books which they have chosen themselves more interesting than they find assigned reading; furthermore high interest increases ease of comprehension.^[33]

Because so much of the research on reading interests has depended on a questionnaire or checklist, it is worth taking a look in more detail at the types of instruments used. Typically researchers elicit basic demographic information (including grade level for school age subjects), ask for the title of the last book read in whole or in part, and ask respondents to complete a checklist or reading interest inventory. “When given the opportunity to read any kind of book you choose, what kind of books do you read. Chose one” (or sometimes two or three):

1. science fiction;
2. fantasy;
3. horror;
4. mystery/thrillers;
5. adventure;
6. western;
7. romance/love stories;
8. biography/autobiography;
9. literary fiction;
10. sports;
11. true life;
12. historical;
13. humor;
14. other (please explain).

Such research based on self-reports is subject to all the usual problems of inexact memory and a lack of shared understanding of the meaning of terms. Is “true life” on this checklist intended as a synonym for nonfiction or does

it mean a realistic novel, set in a familiar setting and focused on real life problems? Does “historical” include historical fiction such as regency romances or war stories or does it refer only to nonfictional historical accounts? As noted by Purves and Beach,^[33] “Adventure as a category may have a number of interpretations (action, suspense, violence, faraway places, and manliness), and the researcher’s conception of adventure may be far from the respondents’ and one respondent’s from another.” These typical problems of survey research are exacerbated in the case of reading by biases introduced by the value society places on certain kinds of sanctioned reading and denies to other kinds of reading which are denigrated if not out and out forbidden. Often the only format asked about is books. Reading magazines, newspapers, fanzines, comics, manga, or Web sites does not count as real reading in most of these studies, although we know that, especially for adolescent boys, these formats are preferred sources of reading pleasure.^[34,35] Research that compiles lists of favorite books or recently read books is likely, especially in the case of students, to reflect the composition of readily available sources of books, such as school-sponsored book clubs and accessible school library or classroom collections.

READING ENGAGEMENT, BOREDOM, AND COMPREHENSION

The flip side of reading interest is reading boredom. In *On Being Literate*, Margaret Meek^[36] says that we need to pay more attention to what beginning readers think they are doing when they read: “Here, again, their boredom is a clue because it manifests itself in their disinclination to continue. When they are bored they shut the book.” Boredom, argues Meek,^[36] is frequently the result of a misalignment between the reader and the text or the learner and the task; boring texts are usually either too difficult or too easy for the reader. Texts can be too hard when they require preliminary knowledge that the reader doesn’t have—either knowledge of the way stories work or of the way the world works—because making meaning out of texts involves fitting what is read into the pattern of what is already known. In any case, what is missing when readers describe books as boring is the element of engagement.

Victor Nell^[37] used the experimental methods of cognitive psychology to investigate the conditions of reader engagement, using terms like “arousal,” “reading involvement,” and “entrancement” to describe the experience of the engaged reader. Experimental subjects who read for pleasure (ludic readers) were asked to read in a laboratory setting an enjoyable book that they chose themselves. Meanwhile subjects were attached to electrodes that recorded heart rate, muscle activity, skin response, and breathing—the variables measured as indicators of

arousal. Among other findings, Nell discovered that levels of arousal were higher during ludic reading than during work reading, despite the fact that the readers themselves experienced the pleasure reading as effortless. The paradox of ludic reading is that deep engagement and high physiological arousal go hand-in-hand with the reader’s sense of effortlessness, where the words on the page drops from consciousness as the reader is absorbed into the world of the book.

The interesting–boring continuum turns out to be a key theme in understanding frustrated readers who have trouble “getting into” a book. When Anne Reeves set out to understand resistant student readers who did not share her own sense of reading as a joyful activity, she conducted in-depth interviews with 25 adolescent readers in grades 9–12 and developed fine-grained case studies of five of these readers. Asked what comes to mind when they hear “reading,” most said the literature studied in English class. These resistant readers all insisted that 1) they could read and 2) that they did read when they were interested in the text. Since most school reading did not interest them, they had developed more or less successful strategies to avoid it, including watching the film, asking someone to tell them what happened in a novel on the English curriculum, or using Cliff notes. The most common advice from her 25 interviewees to teachers was “Choose interesting stuff. Don’t try to make us read boring stuff.”^[38] As Reeves notes, these students view interest as a stable commodity that resides in a text, something that the author can choose either to include or to leave out. They thought of interest-iness as something “outside over there,” not as a product of their own relationship with the text and dependent on their own activity.

Reeves found that readers call a book boring when it requires them to take risks, when the readers’ sense of competence is called into question by a reading task that is too challenging, when the world represented in the book is threatening or painful, or when readers don’t have the necessary background knowledge to make sense of the text. Similarly, in their study of 49 adolescent boys, Smith and Wilhelm^[34] emphasize the crucial importance for readers to have a sense of competence and control in reading; when the boys in their study felt “overmatched” by the reading task, they stopped reading. “Boring” turns out to be a catchall term to describe a negative reading experience, however produced. For example, in Reeves’s study, Duke, a 17-year-old high school senior, described as “boring” the YA book *Go Ask Alice* (1971), which was assigned in one of his English classes. Duke explained: “I don’t like readin’ depressin’ stuff. Her life just started gettin’ worse and worse. . . . It’s bringing me down.”^[39] In the same study, Joel, a 15-year-old student in grade 10, chose to read Stephen King’s *Cujo* (1994) for an English class assignment. He picked *Cujo* because he had heard that King is interesting and because the book itself is “not too long.” However, *Cujo* did not live up to its promise:

Joel found himself at sea because of King's strategy of introducing multiple sets of characters in small introductory scenes, switching rapidly to new scenes and new sets of characters who are apparently unrelated to previously presented ones: "It's just he goes on from one thing, you start reading, and it's like switch to a different thing, and I just kinda got lost about what was going on."^[39] Joel had not read enough complex fiction to have learned that when it's not clear how scenes, characters, or events fit together, you don't start over again at the beginning and read more slowly; you press on because you know the pattern of significance will eventually be revealed. Successful reading of prose fiction depends on knowing what Peter Rabinowitz has called the "rules of reading": these rules "serve as a kind of assumed contract between author and reader—they specify the grounds on which the intended reading should take place."^[40] And how do readers learn these rules of engagement with texts? Most often through reading texts themselves, starting with highly patterned fictions such as fairy tales, series books, and genre books that make the design clear.

READING INTERESTS: HIGH AND LOW

Some scholars have been disheartened by one seemingly intractable fact about reading interests: a majority of readers, when given the chance to choose, prefers a good story told in an accessible style to a literary classic. There are more readers for Harlequin romances than for *Middlemarch* and more readers for thrillers than for serious poetry. When transformations in the technology of printing and distribution, the power-driven cylinder press, new paper-making machinery, cheap postal rates, and a new railway system dramatically lowered costs and made reading materials affordable to a mass audience in the second-half of the nineteenth century in North America, people turned out to want to read cheap popular fiction, a fact that worried some observers. In *The Intellectual Life of the British Working Classes*, Jonathan Rose^[41] notes, "In the late nineteenth and early twentieth centuries, the penny dreadful (cheap crime and horror literature for boys) created something approaching panic among middle-class observers, who were certain that it encouraged juvenile delinquency." A great deal was written at the time and following on the theme of cheap books, trash, rubbish, penny dreadfuls, and sensation novels, some commentators saying that such materials are harmful because they instill "false views of life" and displace better reading while others said that they are beneficial because they introduce readers to the love of reading.

The field of librarianship itself has provided a terrain for a more than century-long contest between two opposed views on what to do about people's reading interests. Should libraries cater to these interests or try to change them by improving reading tastes and inculcating a desire

for something better? Advocates of libraries as a place to serve leisure and recreational readers have recommended finding out more about readers' interests in order to provide reading materials that satisfy these interests. From this perspective, understanding reader interests provides a foundation for building collections of popular materials and for effective readers' advisory service. Advocates of the purely educational function of libraries have criticized this catering to readers' interests as a "Give 'em what they want" approach that undermines the library's educational mandate and produce impoverished "drug store" collections.

Esther Jane Carrier's book *Fiction in Public Libraries 1876–1900*^[42] provides a well-documented account of how these opposing arguments played out during the formative years of public librarianship in North America. With generous quotes from her nineteenth-century sources, Carrier examines what eminent librarians said at the time on such topics as "What is trash?," "High Quality," and "Reading Improvement." During the nineteenth century, there was a strongly held sense of a natural hierarchy of quality in books in themselves. At the bottom were materials whose very names signaled trashiness: penny dreadfuls, dime books, series books, sensational fiction, and popular romances. Further up were solid works of literary fiction as well as nonfiction works that tell a story such as history, biography, or travel books. At the top were serious, nonnarrative forms such as philosophy and theology.

The goal for librarians was to push the reader up the reading ladder from recreational reading to educational reading.^[43] William M. Stevenson,^[44] librarian of the Carnegie Free Library of Allegheny, Pennsylvania, stirred up controversy when he removed from the library books he deemed too low on the reading ladder: books by Horatio Alger, Bertha M. Clay, May Agnes Fleming, Martha Finley (the Elsie Books), E.P. Roe, Mrs. E.D.E.N. Southworth and other popular fiction catering to a taste for "recreation and entertainment only." In his 1896 and 1897 annual reports, he acknowledged that, since "devotees of this class of literature will read nothing else," it was inevitable that overall library circulation figures would drop, but he justified his decision by stating that it is the unswerving duty of libraries to supply "nothing but good books" and set a "high standard for reading in a community." In Stevenson's view, "As a rule the people who care for reading nothing but the latest sensational novel cannot be reached beneficially by the public library. It is a waste of time and money to try." (Quoted in Carrier^[45]). More than a century later, a strong endorsement of the public library's educational function can be found elaborated in Dilevko and Magowan's *Readers' Advisory Service in North American Public Libraries, 1870–2005*. The authors lament the erosion of an earlier age's commitment to a central mission of "meaningful education through serious and purposeful learning."^[46] Regrettably, in their

view, public libraries have become increasingly infiltrated by “a mindset in which the reading of books, no matter their intrinsic quality, is construed as good and where discretionary reading becomes commodified and disposable entertainment, as manifested principally in genre fiction and genre nonfiction (genre titles), bestsellers, celebrity-authored books, and prize-winning titles.”^[46]

READING THE GENRES

Opponents of this hierarchical view of books and reading deny that it is useful to open up too wide a gulf between “high” texts and “low,” between high art and “mass” literature. They point to historical instabilities in the evaluation of genres, one century’s bestselling popular authors such as Dickens and Wilkie Collins becoming canonical works in the next. They argue instead that valuable texts are to be found in all media and in many different genres. Successful reading begins with situating the text: asking what kind of text this is and what qualities and effects do we normally expect to find in texts of this type. The publication of Betty Rosenberg’s *Genreflecting: A Guide to Reading Interests in Genre Fiction*^[47,48] can be seen as a watershed event within the library and information science (LIS) field that legitimized a nonhierarchical way of looking at texts. Rosenberg’s First Law of Reading, “Never apologize for your reading tastes,” included in all six editions of *Genreflecting*, shifts the emphasis to the tastes and reading interests of the reader.

In a simple breakthrough, *Genreflecting* solved for librarians the intractable problem of trying to find a single ladder of quality on which all books can be arranged. Instead *Genreflecting* takes the approach of helping readers situate a given text within its own literary genre, so that comparisons of quality are made *within* a genre not between types of literature that aim at quite different effects. The western is about facing death in an environment stripped down to its bare essentials; the horror story is about scaring the reader; the speculative science fiction story is about “What if?”; the romance is about the developing love relationship of two central characters and the guaranteed happy ending; the mystery story is about uncovering a secret. Since each genre attempts to provide different satisfactions, comparisons are more useful within a genre than across genres. The helpful questions to ask about a particular work become: what are the qualities, effects, and literary conventions that distinguish this particular genre? who are the outstanding exemplars of the craft of writing in this genre? what is it about these exemplars that appeal so strongly to readers who enjoy this genre? how well does this particular work compare with the best examples of the genre in delivering these satisfactions?

An approach to understanding reading interests by studying popular genres has gathered momentum. Robert Scholes defines a literary genre as “a sort of template, used

by both writers and readers, to allow for relatively rapid composition and comprehension. That is, a writer composing a text in a recognized genre begins with a template, a preexisting form, that leaves certain blanks to be filled in.”^[49] This template includes a set of formal qualities that we recognize as typical of the genre and that together work to provide the reader with a predictable experience of pleasure. These formal qualities are like the elements of what Wittgenstein called “family resemblance”—features such as a high-bridged nose or wide-set eyes or red hair that show up in generations of family portraits even though one does not need to find that nose or any other particular feature to identify a portrait as belong to the family. In the case of the Western, for example, the set of stock features, as described by John Cawelti^[50] and Jane Tompkins,^[51] are as formalized as those of the *commedia del arte* or the Petrarchan sonnet. These features include the frontier setting in big sky country of desert, prairie, or mountain; characters such as good and bad gunmen, the solitary outsider who rides into town, the schoolmarm, plucky widow, and saloon girl, the saloon owner, broken-down doctor, cowboy, cattle baron, cavalry officer, scout, Indian, and of course the horse; and plot devices such as betrayal, revenge, retaliatory violence, Indian captivity, the chase, lynching, train robbery, range war, and the show-down or shoot-out.

Blackford^[52] reports that the girls in her study are so familiar with generic conventions “that they identify those conventions as ‘rules’: ‘Now, there’s . . . certain rules that you have to have in horror stories, like whenever you turn around there’s always somebody there, it always has to be nighttime in a thunderstorm, and something scary happens.’ ” The genre book, when it is successful, embodies the familiar elements but in a new way, providing the reader with a satisfying mix of the familiar and the unexpected. Joyce G. Saricks’s *The Readers’ Advisory Guide to Genre Fiction*^[53] provides a very helpful overview of 15 different genres and their characteristic appeal, including for each genre five exemplary authors and titles that are good starting points for exploring the genre. Libraries Unlimited have followed up their wildly successful *Genreflecting* with a series of guides to reading interests, edited by Diana Tixier Herald, that focus specifically on particular genres such as fantasy, mystery, horror, adventure/suspense, historical fiction, romance, or mainstream fiction. Another useful form of introduction to rules governing popular literary genres come from bestselling writers themselves who provide an insider’s view of the genre and its appeal to readers, for example, Sue Grafton’s edited collection of essays on writing mysteries,^[54] Jayne Ann Krentz’s edited collection *Dangerous Men and Adventurous Women: Romance Writers on the Appeal of Romance*,^[55] and Orson Scott Card’s guide to writing science fiction and fantasy.^[56]

As Scholes points out, the genre template serves the needs of writers by providing a ready-made structure and

serves the needs of readers by helping them find their bearings in a book, once reading has begun. Readers use their familiarity with the rules of genre fiction to predict what could possibly happen in a new book they pick up—whether it will scare them or reassure them or amaze them or present them with a mystery to be solved. And of course publishers, who know that readers use genre as a filter in choosing books to read, package books in covers that provide strong generic cues including color-coded covers in green for fantasy, sandy gold for westerns, shades of pink for romance, and black for horror.

Some cultural theorists argue that genre readers are dupes of corporate publishing interests, which provide only the appearance of choice while selling a standardized, mass-produced, cheap commodity that relies on spurious gratifications and emotional appeals. The test case has been the romance, which is the most denigrated of all the genres. Romance accounts for a huge percentage of book sales—one-quarter of all books sold and 40% of mass paperback sales, according to the Romance Writers of America Web site.^[57] The Romance Writers of America website notes that in 2006 there were approximately 6400 romance titles released, generating 1.37 billion in estimated revenue. In her introduction to *Dangerous Men and Adventurous Women*, Krentz describes romance as a fantasy of female empowerment in which the woman always wins: “In romance the success of an individual author is . . . [based] on how compellingly she can create her fantasy and on how many readers discover they can step into it with her for a couple of hours.” Krentz argues that readers have no difficulty distinguishing the inevitably happy endings of the fantasy from the reality of their everyday experience. They *choose* to enter the romance world for a couple of hours to experience a reaffirmation of hope and the importance of loving human relationships.

READERS’ ADVISORY AND APPEAL FACTORS

Understanding reading interests has been considered foundational for readers’ advisory work as it has been practiced in public libraries since the early 1980s. Melanie Kimball’s chapter on the history of readers’ advisory in the sixth edition of *Genreflecting*^[58] describes what she calls a “complete overhaul” of readers’ advisory service. She identifies several significant milestones in the formation of the new breed of readers’ advisor as someone who understands reading interests and can “recommend fiction reading, particularly genre fiction.” Among these milestones were the already-mentioned first edition of *Genreflecting*, Joyce Saricks and Nancy Brown’s *Readers’ Advisory Service in the Public Library*,^[59] Ted Balcom’s *Book Discussion Guide for Adults: A Leader’s Guide*,^[60] and the formation of the Adult Reading Round Table in

Chicago in 1984, a group of librarians who met to foster the study of reading interests and popular genres of fiction. Because fiction accounts for such a large share of popular reading, readers’ advisory work focused initially on popular genres of fiction and their appeal factors. By the 1990s, however, the scope of readers’ advisory service was expanding to include popular nonfiction which can be read for pleasure, specifically those nonfiction works with a strong sense of story, such as travel, biography, history, true accounts of crime, adventure, or sports. Robert Burgin’s *Nonfiction Readers’ Advisory*^[61] is an edited collection of articles that argue that the concepts of genre and appeal factors used for fiction can also be used effectively to serve nonfiction reading interests.

Appeal factor is a concept introduced by Saricks and Brown in the first edition and elaborated in Saricks’s third edition of *Readers’ Advisory Service in the Public Library*. Thinking about a book’s appeal factors takes us beyond subject headings or a bare plot summary. It is a way of helping readers’ advisors identify textual elements in a book that satisfy a reader’s desire for a particular reading experience. On the basis of many years of front-line work with public library users, Saricks^[62] reported, “We have found that most [leisure] readers are not looking for a book on a certain subject. They want a book with a particular ‘feel.’ . . . Appeal elements describe more accurately [than subject headings alone] the ‘feel’ of a book.” Readers provide clues about the appeal factors they prefer when they talk about a book read recently and enjoyed. Does the reader use terms like “compelling” and “fast-paced” or does the reader praise the book’s leisurely unfolding? Is the reader looking for something that is heartwarming and comforting or challenging and edgy? Following deep listening to what readers say they look for in a good book, readers’ advisors try to match a reader’s interests with a book’s appeal factors, namely pacing, characterization, storyline, and frame (i.e., the book’s particular atmosphere or tone).

IN CONCLUSION

As fine-grained case studies of individual readers accumulate, they have confirmed Ruth Strang’s 1942 finding that reading interests and preferences, in all their individuality, emerge from a central core or radix that determines any individual’s pattern of reading. Correlations of demographic factors to reading choices—e.g., men read nonfiction; women read novels; men prefer science fiction and action adventure; women prefer fantasy and romance—these generalizations can be useful in predicting trends in sales and borrowing but don’t help much in understanding any particular reader, whose reading preferences are as individual as a fingerprint. For some librarians and readers’ advisors, the next step in understanding readers is writing a reader profile, starting with themselves. As

Joyce Saricks notes about the process of reflecting on our own reading interests, "When we see the variety of books we enjoy, we begin to understand that other readers feel the same way."^[63]

Abstract

This entry describes two important classes of systems that facilitate the sharing of recommendations and expertise. Recommender systems suggest items of potential interest to individuals who do not have personal experience with the items. Expert locator systems, an important subset of recommender systems, help find people with the appropriate skills, knowledge, or expertise to meet a particular need. Research related to each of these systems is relatively new and extremely active. The use of these systems is likely to continue increasing as more and more activity is implicitly captured online, making it possible to automatically identify experts, and capture preferences that can be used to recommend items.

INTRODUCTION

Despite the abundance of recorded information, many information seekers turn to other humans for advice and recommendations. Humans, after all, can be quite adept at identifying and solving problems, summarizing relevant content, generating new ideas, and personalizing information. In addition, for some, interacting with other humans is far more socially enjoyable than interacting with static content. Thus, it is no surprise that the Internet is as much a platform for social interaction as it is a document repository.

System designers have taken advantage of the fact that so much social action is captured online by creating systems that extend traditional word-of-mouth exchanges. This entry discusses two such systems: *recommender systems* that provide personalized recommendations (e.g., movie suggestions) for items of potential interest, and *expert locator systems* that automatically identify experts on a particular topic of interest making it possible to obtain personalized advice from knowledgeable individuals outside of one's immediate social network. Expert locator systems can be thought of as a subset of recommender systems where experts are the "items" being recommended. We treat them separately in this entry because in practice there are often important distinctions between recommending items and people. The remainder of the entry defines these two types of systems, outlines their key characteristics, provides some historical and current examples, and identifies the key research questions related to them. It concludes with a discussion about the importance and potential of these

techniques given the increased amount of activity that can be digitally captured.

RECOMMENDER SYSTEMS

People are often confronted with situations where they need to assess the potential value of something that they have never experienced before. We need to find a new book to read, choose a doctor, and know which business is credible. When confronted with these situations, we often turn to experts or peers for recommendations. Increasingly, people receive recommendations from automated tools called recommender systems. For example, people browsing a book at Amazon are presented with a list of related books of potential interest. The related books (listed under the "People who bought this book also bought" header) are identified by a recommender system that relies upon the historical purchasing patterns of Amazon customers. More generally, recommender systems suggest items of potential interest to individuals who do not have personal experience with the items.

Though recommender systems have gained visibility with the spread of the Internet, they are not confined to the Web. Better Business Bureaus, Zagat's restaurant reviews, and The Times Book Review are some examples of recommender systems that predate the Web. Two things make Web-based recommender systems fundamentally different. First, they are able to provide personalized recommendations tailored to individuals. In contrast to The Times Book Review that provides the same recommendations to every reader, recommender systems can recommend a book based

on the other books you personally enjoy, while not recommending it to others with different tastes. Second, recommender systems are able to base recommendations on the data from the masses, not just a handful of reviewers and editors. The online environment has also made it easier to efficiently capture people's preferences and easily distribute recommendations.

Broadly speaking, recommender systems can be classified into two types: collaborative and content-based. Collaborative recommender systems make recommendations based on the prior experience of other users, while content-based systems make recommendations based on features or descriptions of the items themselves. There are also hybrid recommender systems that mix these two approaches. For simplicity, we present them independently in the following sections.

Collaborative Systems

Collaborative recommender systems draw on the historical experience, or preferences of some users to make recommendations to other users. These systems are also called "Collaborative Filters" or "Social Filters" and have been used in a variety of settings to recommend news-group articles (e.g., GroupLens), books (e.g., Amazon's "People who bought this also bought" feature), movies (e.g., MovieLens), music (e.g., Last.fm), and even people (e.g., eBay's feedback system and other expert locators systems discussed in the following section).

Last.fm is a good example of a collaborative recommender system that offers many different recommendations. The site is a music portal that allows users to listen to music, find new music they are likely to enjoy, and find people with similar music tastes. When a user logs into the site, he can enter in his favorite songs and bands and add them to his "playlist," one of the components of his user profile. The system then compares the user's profile with the profiles of other Last.fm users. This comparison makes it possible to identify users who have similar tastes (e.g., people who like and dislike the same music). These individuals are shown as "neighbors" and a user is presented with opportunities to view their music lists. In this way, the system recommends people based on the similarity of user profiles. The system also provides a user with the option of hearing songs that his neighbors as a collective enjoy. Furthermore, when visiting an artist's home page a user can have songs by "similar" artists recommended, where similarity is based on the collective preferences of people who listen to that artist.

To make recommendations like those at Last.fm, a collaborative recommender system must perform the following tasks:

1. Elicit Preferences: Learn about the users' preferences and store them in user profiles.

2. Compute Predictions: Predict how well a user would like an unfamiliar item based on the data from the user profiles.
3. Make Recommendations: Use the predictions to make recommendations.

Fig. 1 provides a schematic representation of a recommender system, showing how these tasks relate to one another. Different recommender systems use different approaches to perform each of these tasks. We now discuss each of the tasks in turn.

Elicit preferences

Recommender system can learn about the users' preferences by explicitly asking them to rate certain items; or by using implicit measures such as purchase history, search history, or time spent browsing an article. Most recommender systems that use the explicit method ask users to rate items in the database that they have experienced in the past. The systems use these ratings to form and periodically update a model of the user's preferences. Some recommender systems employ an alternative approach where they ask all users to rate items from the same "gauge" data set and model their preferences based on these ratings.^[1]

Recommender systems can vary in the amount of detail that is captured with the ratings and the scale used to capture them (i.e., the dimensionality and granularity of ratings). A recommender system could obtain detailed ratings along multiple dimensions (e.g., quality and timeliness) or it could ask for a one-dimensional rating (e.g., overall satisfaction). Ratings could be on an all positive scale, all negative scale, or a positive and negative scale. The ratings can also vary on granularity. They may use a 1

Fig. 1 Schematic representation of a collaborative recommender system.

to 5 scale like Amazon.com or a “thumbs up” and “thumbs down” scale like Digg. Each of these design choices has different implications for the accuracy of recommendations and also a user’s privacy and the ease of entering ratings. They will also influence which prediction algorithms are possible to use.

Compute predictions

Several alternative algorithms are used to make predictions and thus recommendations. Improving the accuracy of predictions is an area of active research, which has received additional impetus through Netflix’s announcement in late 2006 of a \$1 million prize for the first team that improves the predictions of Netflix’s recommender algorithm by 10%.

Recommender algorithms can be classified into two types: (1) memory-based and (2) model-based.^[2] Memory-based algorithms use data from all users to make predictions directly, while model-based algorithms use data from all users to formulate a single model of user preferences, and then use this model to make predictions. Recommender algorithms can also be classified based on whether they use correlations between users or between items.

In the user-user approach, correlation between two users is computed based on the scores of items that are rated (or used if the recommender system uses implicit measures) by both the users. The recommender system computes correlations between all such user pairs, which can be used in a variety of ways. One of the popular approaches is to use these correlations as weights when making predictions by taking a weighted average over the opinions of other users who have rated an item. Another approach is to use the user-user correlations to divide the user population into clusters of users, where users in the same cluster are considered to have similar preferences. Predictions for a user’s hitherto unrated item are made by averaging the opinions of the other users in her cluster. Other approaches use statistical techniques such as Principal Component Analysis or Singular Value Decomposition and seek to identify latent factors in the data and make predictions based on those.

In systems that use the item-item approach (e.g., Amazon.com’s “Users who bought this book also bought” feature), correlations between item pairs are computed instead of correlations between user pairs. Correlation between two items is computed using ratings of all the users who have rated both items. The system recommends items that are highly correlated with the items that are highly rated (or used) by the user.

When computing predictions, recommender algorithms usually perform some sort of normalization in order to account for systematic differences in the way people choose ratings. For example, if a person’s average rating is 4.5 out of 5 and they give something a 3, the 3 rating is

pretty bad. On the other hand, if a person has an average rating of 2.5 out of 5, a 3 rating is pretty good.

Make recommendations

The objective of a recommender system is to present each user with items she is most likely to enjoy. To this effect, a recommender system can use the predictions in a variety of ways. As illustrated in the Last.fm example, the user can choose to have recommended songs play based on similar artists, neighbors, or her entire history.

System designers need to make several important design decisions in this phase. Besides the obvious design decisions about the interface, the system designer needs to determine what is the maximum permissible error. The error could be an error of commission (incorrectly recommending an item) or an error of omission (not recommending an item that should be recommended). The margin of permissible error for either type depends on the benefit of a correct recommendation and the cost of an incorrect recommendation. Consider a hypothetical Web site where medical treatment is discussed and recommended. Here a good recommendation not made or an incorrectly made recommendation could affect the health of a user. For video sharing, Web sites like YouTube, a recommendation is unlikely to have such important ramifications for the user, but it is still an important decision for the service provider. The service provider has an incentive to provide more recommendations if it leads to increased usage (or sale). At the same time the reduced usability due to poor recommendations may result in the user opting out of the system altogether, so there is still a need for an appropriate threshold.

The system designer needs to consider these issues when deciding the metrics for evaluating the predictions and the magnitude of permissible error. A good recommender system should continually seek feedback from the user and evaluate the accuracy of its predictions. Root Mean Square Error (RMSE) and Mean Absolute Error are some of the evaluation metrics commonly used in recommender systems. The Netflix prize requires a 10% RMSE improvement in the predictions of Netflix’s algorithm.

Content-Based Systems

Content-based systems recommend items based on features of the items themselves. Unlike collaborative systems, there is no need for data from other individuals. For a content-based system to work, a representation of each item must be generated. This can be done automatically, as when all of the words in a book or article are indexed. Or, it can be done manually as when a human cataloger associates a particular genre (i.e., romance) or subject heading to a book. An example of a very simple content-based system would be a news aggregation Web site that

displays “related” articles that are textually “similar” to the one that a user is currently reading.

Many content-based systems provide personalized recommendations. In addition to having a representation of each item, this requires that individuals have a user profile that includes data about a user’s likes and dislikes. As with collaborative systems, data for a content-based user profile can be explicitly entered or implicitly captured based on behavior (e.g., purchasing patterns).

This user profile is then compared with the representations of potential items and those that match closely are recommended. A variety of different techniques (i.e., algorithms) are used to compare user profiles and item representations in order to predict which items a user will like. These differ from those used in collaborative systems because the comparison is not between different ratings; it is between a user’s profile and the representations of items. Common techniques are the use of information retrieval and machine learning algorithms (Hinshelwood^[3] for a more complete list with examples).

Pandora is an example of a content-based system that recommends music. In contrast to Last.fm, it does not rely on any other user recommendations. Instead, it is based on a representation of each song, called a Music Genome, which is created automatically by a special software tool. A song’s Music Genome consists of hundreds of musical attributes that describe qualities of melody, harmony, rhythm, form, composition, and lyrics. When a user enters a favorite song, Pandora recommends other songs with a similar Music Genome. Over time, users are presented with new songs which they rate. A user profile is automatically created that keeps track of the user’s likes and dislikes. Additional songs are recommended taking into consideration the entire user profile.

Challenges of Recommender Systems

Designers and managers of recommender systems face several challenges. Some of these are dependent on the type of recommender system.

Content-based systems face two primary challenges:

1. Creating representations of certain items can be costly and time intensive. Although full-text, digital documents lend themselves well to automatic indexing, other items such as physical objects, small textual items such as quotes, and movies are difficult to automatically index in a satisfactory way.
2. Even when representations of items are available, they may not represent the characteristics that are most important to the user’s enjoyment of the item. Jokes are a good example of this. While one could index the words used in a joke, the user’s enjoyment of the joke has far less to do with the words than it does with the humor. In other words, knowing that a

joke is about a chicken doesn’t help a user know if she would enjoy the joke. One potential strategy for overcome this problem would be to add meta-data to items. However, for items like jokes or poems the meta-data would be so subjective that it would not likely produce accurate predictions for any particular user.^[3]

Since collaborative systems are not based on the representation of an item, they can work for items that are costly or difficult to accurately represent, such as physical objects or jokes. However, they have their own set of challenges:

1. Eliciting enough user ratings to generate accurate predictions for all items is a constant source of concern for the designers and managers of recommender systems. Users need to be provided with sufficient incentives to participate.
2. New users and new items both suffer from the “cold-start” problem. New users do not get good recommendations until they have rated a sufficient number of items; and new items rarely get recommended until a sufficient number of users have rated (or used) them.
3. There may be entities that have an interest in manipulating the recommender system in order to promote certain items. An example of such a manipulation scheme called “sybil attack” or “shilling attack” involves creating a number of spurious users and providing ratings such that certain items get recommended more often. Preventing such manipulations or limiting the damage they cause, is an important consideration for recommender system designers and an active area of research.

To overcome some of these challenges, recommender systems may use a combined approach (both content-based and collaborative) or provide tools that allow people to use preexisting data (e.g., upload iTunes playlists all at once).

Recommender System Research

Online recommender systems have been developed and studied since the mid-1990s. Two related systems were simultaneously developed in the mid-1990s and were instrumental in showing the value of collaborative recommender systems:

1. GroupLens—a net news collaborative recommender system created by Resnick et al.^[4] Resnick continued to study recommender systems as an editor for a special issue of *Communications of the Association for Computing Machinery (ACM)* on the topic in 1997^[5] and as a contributor to numerous articles on the subject. Reidl has also remained highly active in recommender system research with his colleagues at the

GroupLens research lab at the University of Minnesota. They have performed a number of studies of MovieLens, a recommender system for movies. Their Web site^[6] is a good starting point for potential researchers with its list of publications and downloadable datasets.

2. Ringo—a music collaborative recommender system developed at MIT by Shardanand and Maes.^[7] It was later made into a commercial product called Firefly, which was eventually bought out by Microsoft. Music recommender systems are now common and among the most advanced and popular (e.g., Last.fm, Pandora).

Research on recommender systems has continued to grow and doesn't show any signs of slowing down. Several special issues of well-respected journals have focused on recommender systems including the *Communications of the ACM*,^[5] *ACM Transactions on Information Systems*,^[8] *ACM Transactions on Computer-Human Interaction*,^[9] and *IEEE Intelligent Systems*.^[10] Research can also be found in conferences like ACM Special Interest Group on Information Retrieval, ACM Computer-Human Interaction, and ACM Electronic Commerce. Numerous workshops have been held over the years, and in 2007, the first annual ACM Recommender Systems^[11] conference was held. Current research focuses on nearly every aspect of recommender systems from the recommendation algorithms, to interfaces design, to security, and privacy issues.

Summary

Recommender Systems are a powerful tool for recommending new items to individuals either based on content (content-based systems) or other users' experiences (collaborative systems). It is a highly active area of research that epitomizes the current social computing trends. While there are challenges with recommender systems (e.g., needing sufficient numbers of people and items rated before it works), they have already become widely used by corporations such as Amazon, NetFlix, Pandora, TiVo, Google, and others.

EXPERT LOCATOR SYSTEMS

Turning to experts for help is nothing new. We are all familiar with the ability of experts to diagnose a complex problem, clarify an issue, identify hidden structure, point us to a hard-to-locate resource, and perform a task that requires significant skill. Although some expert knowledge can be made explicit in the form of books, videos, diagrams, and knowledge-base entries, other knowledge is implicit and difficult to codify. Thus, it is often preferable to gain access to the source of the knowledge, the expert,

in order to obtain the full benefit of the expertise. Unfortunately, it is not always easy to identify experts, especially within large organizations or distributed communities. Recently, systems have been developed to help locate individuals with needed expertise. These expert locator systems go by many names including expertise finders, expertise location engines, expert locators, and enterprise expertise management systems.

An expert locator system is a collection of technologies and social practices designed to help an individual find someone with the appropriate skills, knowledge, or expertise to meet a particular need. Some are stand-alone systems, but most are integrated into a more comprehensive knowledge management solution. While a basic organizational chart or an informal friendship-based network may be considered an expert locator system in the broadest sense, the term typically refers to more advanced systems that use implicitly or explicitly provided data to identify experts.

Researchers and practitioners have developed and examined expert locator systems since the early 1990s. Most empirical studies have taken place within large corporate settings, although more recent work has looked at expertise location among peer groups and virtual help-based communities. The most active research communities currently examining expert locator systems are the Computer Supported Cooperative Work (CSCW) and Knowledge Management communities. As a result, research on the topic is often published in conference proceedings in these areas (e.g., ACM-CSCW, ACM Conference on Information and Knowledge Management, ACM International Conference on Knowledge Discovery and Data Mining, ACM Recommender Systems) and information systems journals such as CSCW and KES (Knowledge-Based and Intelligent Engineering Systems). However, a considerable amount of research is scattered throughout publications on topics such as artificial intelligence, algorithms, Web personalization, and information systems more generally.

The following sections describe different subtypes of expert locator systems. The area is new enough that the vocabulary around them has not yet solidified. We group the systems into the following categories: *expert databases*, *automatic expertise finders*, *expertise recommenders*, and *expert referral systems*.

Expert Databases

Early expert locator systems were usually called expertise databases, knowledge directories, yellow pages, or knowledge maps. These systems consist of a searchable database of individuals along with data about their prior experience, expertise, organizational role, and contact information. Typical systems include Microsoft SPUD, HP CONNEX, and the NASA expertseeker. These systems are usually

designed for identifying experts to help solve technical problems or to match employee competencies with company positions.

Inputting accurate and detailed enough data into these databases can be a significant challenge. Some organizations rely upon assessment interviews, skill inventories, and extensive surveys of employees, but such methods can be costly and labor intensive. In other cases, individual employees are expected to enter information about themselves. Although individuals are the most qualified to describe their own expertise, they often lack motivation to add content—an activity that has few immediate rewards. Furthermore, they may not recognize the potential value of some of their less obvious skills and fail to report them. No matter who contributes the data, expert database entries can suffer from being over-simplified, one-dimensional assessments of expertise that are not informative enough to help direct the fine-grained, context specific questions that lead people to seek out experts. Finally, some systems rely on taxonomies to describe and catalog people's knowledge and skills. While this may encourage consistency and point out areas that may not have been considered, developing, and implementing taxonomies requires considerable effort and are likely to be misapplied if individuals are entering their own data.

Another related challenge is maintaining content over time. People leave, new skills are developed, positions change. For those who rarely use expert locator systems, keeping their data current is not on their top list of priorities. As a result, some expert databases quickly become obsolete. Additionally, organizations may not initially recognize the full investment required to maintain these systems once they are created.

Automatic Expertise Finders

As more and more activity occurs in the digital environment, it has become possible to profile individuals' expertise based on their conversations (e.g., in discussion forums and e-mail exchanges) and the documents associated with them (e.g., publications). An *automatic expertise finder* is a type of expert locator system that takes advantage of the implicit data left behind in the form of digital traces and documents. Such systems typically build expertise profiles from the implicit data by using information retrieval techniques (e.g., indexing). A person's expertise is usually described as a term vector and is used later for matching expertise queries using standard IR techniques. This allows people to search for a relevant expert in much the same way that they might search for a relevant document.

Well-known systems in this category include Who-Knows,^[12] ContactFinder,^[13] and MITRE MII Expert Finder.^[14] Who-Knows identifies experts across an organization by using Latent Semantic Indexing techniques on the project documents people produce. ContactFinder

identifies experts based on their participation patterns and message content. Expert Finder identifies experts based on documents people produce, as well as some experience-related information including basic employment information (e.g., positions held) and projects in which they participated.

These systems solve many of the challenges of expert databases since there is no need to manually contribute and maintain expertise information, and the automatically generated profiles are considerably more developed than the simple keyword-based profiles. However, these systems also have limitations. First, some individuals have expertise that is not yet represented in their digital traces. This is particularly true of new employees, as well as individuals who rely primarily on telephone and face-to-face meetings. Second, from the technical perspective, we still need to improve ways of selecting and integrating different sources and types of data to better reflect people's expertise. We also need to improve the ways of matching information seekers' fine-grained information needs with the large and amorphous expertise profiles. These are active areas of research, and we can expect improvements in the techniques that are used.

Finally, and perhaps most importantly, these systems largely do not consider the social perspectives of expertise sharing. For instance, their results are usually ranked purely based on the computed information similarity between the query and profiles. However, there are many other criteria that people use to select experts in real life and many other social factors that contribute to individual's willingness to share information and have meaningful interactions. The following section discusses systems that were designed with these social considerations in mind.

Expertise Recommenders

Rooted in the field of CSCW, Ackerman and other researchers developed a series of systems that address both social and technical issues related to expertise location and sharing. In contrast to systems that only identify experts based on content overlap, these systems attempt to create a social and technical environment that encourages information sharing and recognizes the importance of social context.

Answer Garden (AG) is a system designed to help in situations like technical support, where there is a continuing stream of questions, many of which occur repeatedly, but some of which have never been seen before.^[15] It has a branching network of diagnostic questions that helps users find answers. If there is no available answer, it automatically routes the question to the appropriate expert who can answer the user and record the answer into the branching network for future users. The design of AG addresses two important social issues in expertise finding. First, askers are anonymous to the experts. This decreases the asker's social

costs related to status implications and the need for reciprocity, although it also loses some of the potentially helpful contextual information. Second, by continually adding questions and answers into the corpus, it decreases the expert's workload in answering the same questions repeatedly and grows the organizational memory incrementally.

Field studies of AG showed mixed results. Questioners appreciated the anonymity, but many of the answers they received were not at the appropriate level (e.g., an answer was too technical and lengthy). This finding suggests that expertise locator systems should route organizational members to individuals with the right level of expertise, not just to experts with the highest level of expertise. A future field study of an AG-like system highlighted some of the limitations of the system including frustration due to incomplete data and continually changing classification schemes.^[16] The study also found that the AG approach is subject to the impact of the given division of labor and organizational micro-politics.

A new version of AG, AG2 was developed to overcome some of the original limitations.^[17] Unlike AG, where the expert location occurred manually, an expertise location engine was developed for AG2. Various computer-mediated communication mechanisms are also added. One important social innovation was the fact that the AG2 expert locator algorithm prefers to "stay local" when selecting expertise to allow contextualization, a concept that was found useful in later systems as well. If a local expert is unavailable, the system supports an escalation process whereby the query is sent on to others until an answer is provided. Thus, the system helps gracefully overcome failures with initial expert recommendations. Another interesting change to AG2 is that the system tends to blur the dichotomy between experts and seekers, recognizing that individuals may be novices in some areas and experts in other areas.

Expertise Recommender (ER) is another system developed by McDonald and Ackerman in order to address issues identified from a field study of AG2.^[18] The major contribution of this system is that it can select experts based on a range of social factors such as organizational closeness and workload, not just level of expertise. As more data about our actions and relationships become available online, many new possibilities for identifying an *appropriate* expert become viable.

It is important to recognize that the systems discussed in this section are research prototype systems that are not as widely used as those previously discussed. Although a framework for including additional factors into the expert identification algorithms has been developed, few modules have been implemented. Future research examining the social factors that should be considered (e.g., privacy considerations and motivational issues) when recommending experts seems promising. It short, this research shows that finding an expert is not enough. One must also understand the other social factors related to

their willingness to participate and have enough contextual knowledge to help.

Expert Referral Systems

Another approach to identifying experts is to use a referral process, where an individual has his colleagues and friends introduce, or refer, an expert. This referral method has been used throughout time. However, as more information about our social relationships is made available in digital form, systems have been developed to augment our ability to get high quality referrals from our peers. We call these *expert referral systems*.

ReferralWeb was the first well-known system that utilized social network information to help individuals find and be introduced to experts on a particular topic.^[19] In ReferralWeb, people's expertise are indexed based on individuals' publications. Social network information is extracted from the coauthorships or co-appearances in their Web pages. Experts are identified via traditional information retrieval techniques (as described in the *automatic expertise finders* section). Once identified, the information seeker is presented with visualizations of the network structure, and a list of referral chains that can be taken to get from your known peers to the desired expert. For example, it might show that my friend John knows Lucy who knows the expert Jack; likewise it would show other paths to Jack through different friends who know him.

Although not designed specifically for the purpose of finding experts, Yenta^[20] helps individuals find others with similar interests—individuals who may be in the best position to provide expert advice. Yenta acts like a personal agent. It creates people's personal interest profiles by mining documents in their local machines. The profile is stored locally and uses inter-agent communication to find people who have information similar to the query, all the while protecting the actual content from being shared with others. Yenta also clusters people based on their shared interests to built social coalitions and provides tools to communicate with others in the same cluster. Thus, Yenta can be thought of as a recommender system as described earlier in this article. Other related systems include MARS^[21] and SWIM.^[22] Recently, with the advancement of social network theory research, there are increasing number of peer-to-peer applications designed to share knowledge and resources (e.g., files and contacts) through social networks, as well as commercial social network systems (e.g., spoke and visiblepath) that are designed to help people share contact information. As social networking sites such as Facebook and LinkedIn become ubiquitous, expert referral systems will be a natural fit.

These expert referral systems have several advantages and disadvantages. They support the age-old practice of finding information through social contacts that is familiar to all of us and socially acceptable. They provide added

motivation for individuals to help those who seek them out; after all, an expert is more likely to provide help if they have been introduced by a mutual friend or perhaps even an automatic agent that has identified some hidden similarity. These systems are relatively easy to implement using basic peer-to-peer and information retrieval techniques. They also can provide contextual information about individuals based on their social network relationships, helping expert seekers make more educated decisions about whether or not it is worth contacting a particular expert. Unfortunately, systems like ReferralWeb increase the amount of time required to contact an expert; not only the information seeker's time but also the friends that are part of the referral chain. They may also decrease the pool of experts who are reachable in practice, since referral chains that are too long (or nonexistent) discourage contact with the expert. There is a need for more empirical studies of these systems to help reveal additional advantages and disadvantages.

Summary

In this section we have outlined a variety of different expert locator systems including expert databases, automatic expertise finders, ERs, and expert referral systems. Additional systems are described in Ackerman et al.^[23] Because research on expert locator systems is still in its infancy, the specific terminology and categorization we provide is tentative and likely to change as new techniques are developed and integrated with other knowledge management and social software programs. However, many of the key principles, trends, and design considerations discussed above are enduring. In this summary, we address two of the most prominent.

One common trend is the use of implicit data rather than explicitly entered data in expert locator systems. This trend is likely to continue as more and more of our activities are recorded in a digital environment and can potentially be used to identify our expertise domains, our social network ties, and other factors of interest (e.g., availability). For instance, Zhang et al.^[24] explored ways of using people's asking-answering histories in online forums to infer expertise levels. Further developing tools to integrate these various data sources will be vital to improving expert locator systems. These issues are also important for designing recommender systems more generally.

Another common theme is the need to consider the social implications of expert locator systems. The *expertise recommenders* and the *expert referral systems* emphasize that locating the most knowledgeable individual on a topic is not enough. After all, the most knowledgeable individual may not be able to present information at the right level for the information seeker or may be too far removed from the local context to be of benefit. Furthermore, the most knowledgeable individuals may not have sufficient incentives to participate, especially if they are

bombarded with questions from strangers. Systems that take into consideration these social factors and align the incentives of the various parties are far more likely to succeed in the long run. In this sense, expert locator systems may be better labeled expertise sharing systems.

CONCLUSION

In this entry we have discussed two types of systems that facilitate learning from other people in a highly personal way. Recommender systems provide personalized recommendations for individuals about items that they have not yet experienced for themselves. Expert locators help identify people who are knowledgeable on a topic, so they can personally engage with those who seek their expertise. These systems provide nice alternatives and complements to traditional information retrieval techniques. When finding a relevant document is not enough, expert locators provide access to individuals with expertise and recommender systems provide additional pointers to resources that may not have been considered in the original search query. Research on these topics is growing rapidly and the methods for performing them are improving as a result. In addition, as more and more activity is implicitly captured online, it is increasingly possible to improve these tools and apply them in new domains.

Records Compliance and Risk Management

Bradley J. Wiles

Hill Memorial Library, Louisiana State University, Baton Rouge, Louisiana, U.S.A.

Abstract

This entry considers *records compliance* and *risk management* in the context of archives and records administration. It provides a definition of these terms as separate concepts and examines them in combination.

INTRODUCTION

The concepts of *compliance* and *risk management* have been applied to various methods and strategies of business operations in a wide variety of industries over the past several decades.^[1] This entry identifies banking, investment firms, and insurance companies as being particularly sensitive to managing risk and maintaining compliance to ensure sound business management. Minimizing risk and meeting various levels of statutory obligations are consistently perceived as necessary for stability, growth, and longevity. This is particularly relevant in the *archives and records administration* field, where securing the human record depends on evolving legal requirements, professional norms, and institutional standards. This entry will examine the place of compliance and risk management within the context of archives and records administration. It will provide separate definitions of each concept and evaluate these as related and complementary aspects of the creation, capture, and use of records.

Perhaps first it would be useful to provide a comprehensive definition for records management, simply because the principles it encompasses are generally applicable to a wide array of records and information activities. Records management is,

a professional discipline that is primarily concerned with the management of document-based information systems. The application of systematic and scientific controls to recorded information required in the operation of an organization's business. The systematic control of all organizational records during the various stages of their life cycle, from their creation or receipt, through their processing, distribution, maintenance, and use, to their ultimate disposition.^[2]

The purpose of records management is, "to promote economies and efficiencies in recordkeeping, to assure that useless records are systematically destroyed while

valuable information is protected and maintained in a manner that facilitates its access and use."^[2]

Records management is also concerned with the analysis of any and all recorded information created, received, maintained, or used by an organization in accordance with its mission, operations, and activities.^[3] Furthermore, records management deals with records regardless of age, type, or format, and is often an enterprise-wide undertaking that relies on cooperation at all levels of an organization.^[4] Present-day records management is an outgrowth of traditional archival practice, but typically deals with contemporary recorded information and documents.^[4] In the mid-twentieth century, a distinction was made between "historical" and "modern" documents, mostly because of the deluge of records flowing into traditional archives following World War II.^[4] However, this distinction is no longer prevalent, and records management principles are applied to records produced by corporations, businesses, and governmental units (organizations using and retaining documents in the course of regular business), as well as those kept by historical societies, manuscript libraries, and other cultural institutions (organizations who hold collections for reasons of scholarship or posterity). In nearly all instances, the concepts of compliance and risk management factor significantly into the modern practice of archives and records administration.

RECORDS COMPLIANCE

It is somewhat difficult to comprehensively define compliance in the context of archives and records administration, simply because compliance measures are constantly in flux. In most instances, recordkeeping and reporting are part and parcel of other core compliance areas within organizations. These might include promoting fair and ethical business conduct, requiring proper environmental, health, and safety policies, or ensuring consumer protection,^[5] and may or may not have a records component.

In general, records compliance requirements derive from legislation, regulatory standards, codes of best practices, or community expectations (p.10).^[4] These requirements exist at all social, political, and organizational levels, might be explicit or implied, and incorporate any number or combination of requirements (pp. 38–39).^[4] For example, explicit legal requirements for the creation and management of records in a particular industry could mandate the extended retention of certain types of records created in particular operational contexts. It might also dictate the form in which these records should be maintained, the rights of individuals or corporate bodies to have access to those records, and the protection of the intellectual property that the records contain (p. 38).^[4]

Compliance requirements affect records at all stages throughout their life cycle and can be subject to multiple legal jurisdictions. A significant amount of legal research is often necessary for organizations to determine the legal requirements for retention, destruction, discovery, and disclosure. The first step is to verify which authoritative entities the organization falls under. The degree of regulation varies by the type of industry and while the majority of businesses and organizations are not subject to any recordkeeping guidelines, those that are (e.g., financial services and pharmaceuticals) tend to be heavily regulated by multiple entities.^[6] In particular, those responsible for an organization's legal and regulatory records compliance in the United States should be familiar with the Uniform Rules of Evidence (which apply to state courts), the Federal Rules of Evidence (which apply to federal courts), the National Conference of Commissioners on Uniform State Laws (which helps interpret and standardize laws across jurisdictions), the Uniform Commercial Code, the Uniform Electronic Transactions Act, the Photographic Copies as Evidence Act, the Federal Paperwork Reduction Act, the Code of Federal Regulations, and the statutes of the National Archives and Records Administration.^[6]

The notion of accountability factors heavily into an organization's need to maintain compliance with strictures set forth by internal and external forces. In order to support accountability the records management department or representative must initiate a multilateral assessment of business needs, evidentiary requirements, legal obligations, and recognized best practices (pp. 155, 158).^[4] This will enable ready response to legal challenges, grievances, and complaints from within and outside of the organization. Typically, compliance is checked—and accountability is fostered—through any number of internal and external inspections and audits, which often consist of a close physical examination of an organization's recordkeeping system measured against whatever compliance issues are at hand (p. 159).^[4] The most effective audit procedures are ones established at the founding of the vital records management program and that remain

sensitive to changing compliance regulations (pp. 75–76).^[3] Audits best support accountability through regular scheduling that matches other organizational troubleshooting efforts and through designating proper authority to carry out inspections, make assessments, and implement recommendations. Though records retention audits typically only consist of a sampling of an organization's records series, this is usually sufficient to determine that organization's appropriate level of need for records security, storage, duplication, and destruction (pp. 75–76).^[3]

RISK MANAGEMENT

According to the Association of Records Managers and Administrators, or ARMA International, risk management is a process that ensures an organization does not assume an unacceptable level of risk and includes both risk analysis and risk assessment procedures as key components.^[7] The level of risk is determined by the importance of the record. All records have relative value, but vital records—ones that are unique and irreplaceable—tend to take precedence over those that can be recreated or those that are not essential to normal business operations (p. 73).^[2] Risk analysis involves the evaluation of exposure of vital records to specific risks and provides a basis for protection planning by identifying threats and vulnerabilities (p. 133).^[3] There are several broad categories of threats, which include destruction, loss, corruption, and improper disclosure of records and information (p. 133).^[3]

In any organization it is imperative to discern acceptable levels of risk and typically this is accomplished through qualitative or quantitative risk assessment. The qualitative approach is most useful at identifying and categorizing physical security problems and other vulnerabilities such as malicious destruction, warfare, terrorist attacks, civil insurrections, purposeful sabotage, vandalism, and theft, as well as natural disasters or man-made accidents, errors, negligence, and incompetence (pp. 133, 136).^[3] Quantitative risk assessment is based on methodologies developed for product safety analysis and computer security applications (p. 136).^[3] It initially relies on qualitative measures such as site visits, and focuses on group discussions, but also uses numeric calculations to determine the annualized loss expectancy of a given institution (p. 136).^[3] This dollar amount is estimated by figuring the probability of a particular event (or events) occurring over a given time span (p. 137).^[3] Ultimately, it factors in the cost of record or information restoration, the loss of business as a result of not being able to perform specific business functions, and the costs of any litigation that might ensue (p. 137).^[3] Upon completion of the analysis and assessment, risk can be managed through a series of controls, protections, and preventative measures that include strategic location (or relocation) of facilities,

limiting access to vital records storage areas, stringent personnel screening and training, effective physical and electronic security, maintenance of multiple copies of vital records and information, initiating disaster recovery and business continuity plans, and developing a system of internal audits to ensure structural integrity (pp. 138–141).^[3]

Though risk management largely addresses the prospect of lost business or capital, it would be insufficient to consider records risk management strictly in financial terms. One of the main tools of managing risk is the development of records retention policies and schedules. A records retention plan helps prioritize value by determining the risks involved in not keeping or destroying a set of records against the costs of maintaining them (p. 161).^[4] However, this often represents a convergence of competing interests between internal and external factors, which are not always financial. For example, cultural institutions such as archives repositories or special research libraries might feel justified spending an inordinate amount of resources to keep a certain records collection because of its social or historical importance, or because of the prestige it confers on the institution. Likewise, organizations that do not use records expressly for their scholarly or cultural value still might justify the expense of maintaining an historical archive because of its potential to provide materials for advertising, marketing, public relations, and in support of corporate memory (pp. 158–159).^[4] The length and quality of any retention program can be radically contingent among the various types of organizations that use records and the functions that those records fulfill.^[8] This entry identifies the traditional retention schedules as following along departmental and functional lines, which can cause a tremendous amount of overlap and duplication. It recommends a process-based retention schedule that documents the work flow and follows legal retention requirements and business needs. This duration is based on the operational needs of the institution and the multiple levels of risk that accompanies those needs.

Though risk management procedures are partially based on what *might* happen—the worst-case scenario, the probability of disaster—it also involves active management of records and information assets from the earliest stages of production. Increasingly this means following a legally viable records retention policy, after taking steps to ensure authenticity in the production of records and information to meet all legal and regulatory requirements (p. 103).^[4] The possibility of litigation has emerged as a primary concern in the creation and capture of records, particularly in the digital age when most documents are not necessarily created, stored, and disseminated in static formats.^[9] The types of records that withstand legal challenges are those created as part of a transaction (as opposed to those created *ad hoc* or retroactively) during the regular course of business and that comply with legal

guidelines for content, medium, or layout (pp. 103–104).^[4] Indeed, the landscape of records management, and thus the tools and procedures for managing risk, currently operate under a hyper-regulated atmosphere of compliance.

RECORDS COMPLIANCE AND RISK MANAGEMENT IN COMBINATION

According to a recent article in a financial services publication,

In recent years... risk management and compliance have begun to converge in a new paradigm. In what amounts to a subtle but important shift in mindset, compliance requirements are now considered a major source of risk... Such thinking leads to a natural prioritization of compliance initiatives: Those risks that pose the greatest threat... are highest on the list. Strategies to eliminate and/or manage such risks become the primary focus of the compliance function. Since compliance requirements that relate to protecting client interests pose some of the greatest risks... taking a risk-oriented approach to compliance naturally aligns the firm's interests with client interests.^[10]

The relationship of records compliance and risk management in archives and records administration is often one of reciprocity. The identification and management of risk is usually dictated by compliance measures that exist within and outside of an organization. Compliance measures—through legislation, best-practices initiatives, or organizational rules—are sensitive to business needs and generally reflect standards determined by industry-wide risk assessment. This reciprocal relationship is perhaps most fully embodied in the Australian National Archives, which adopted the Australian Standards for Records Management (AS-4390) in 1996.^[11] AS-4390 approaches government records from a risk management perspective and seeks to ensure impartiality and accountability among the creators and keepers of state records.^[11] AS-4390 also provides for a system of compliance audits and continual monitoring of documentary integrity (pp. 171–172).^[4] In this sense, AS-4390 demonstrates how, when applied to an organization, the principles of risk management and compliance are interrelated and complementary. In 2001, it was adapted by the International Organization for Standardization (ISO 15489-1:2001) as the preferred model for electronic records produced and maintained by governmental bodies (pp. 27, 249).^[4] The authors note that ISO 15489-1:2001 standard for sustainable records management is based on AS-4390, and these provide the “benchmark against which records management programmes and systems can be measured.”

In some instances the confluence of risk management and compliance complicates the rubric under which an

organization operate's. Risk often accompanies reward and sometimes the benefit of partial or noncompliance is perceived as outweighing the cost. For example, a multinational company may have branches in several jurisdictions that all require different retention periods for vital records. To keep all vital records in every jurisdiction for the longest possible period to cover all bases may be cost prohibitive. To irregularly schedule and follow several retention plans may be logistically impossible. In this instance, the organization will likely turn to whatever cost/benefit analysis its risk and compliance cohorts have formulated. They would consider which records were most abundant and valuable, where these records were located, and exactly what compliance requirements it was absolutely necessary to fulfill. In the event that the compliance measures did not specifically address records, the organization would factor in limitations on legal recourse against any action they might carry out (p. 159).^[4] From there, it could be decided that the risk of less than full compliance of certain records (of relatively low value) in certain jurisdictions (with less punitive measures and enforcement) is acceptable. The likelihood of getting caught and receiving a fine, or of losing business and prestige, might be considered less than the cost of full compliance.

Though this may not present an ideal scenario, realistically the level of compliance becomes a matter of how an institution chooses to allocate its resources, particularly in a regulation-heavy climate.^[12] This entry asserts that despite the billions of dollars spent to accommodate laws like Sarbanes-Oxley and HIPPA, one hundred percent compliance is "fundamentally impossible." However, compliance and risk management are increasingly no longer viewed as necessary evils or impediments to profitable business operations. More and more records are considered assets, whether they are used in everyday business transactions or for academic and cultural reasons. As a result, risk management and compliance are increasingly perceived as core operational functions, integral to the solvency and growth of an organization. In the wake of far-reaching banking, investment, and corporate accounting scandals of this decade, risk management and compliance in records administration should further gain cachet as necessary systemic enhancements. They should no longer merely serve as corrective measures only used after an organization gets caught doing something illegal or unethical.

CONCLUSION

This entry has attempted to identify the key elements of risk management and compliance in archives and records administration, both as individual concepts and as complementary components of recordkeeping. It should be reiterated that the management of risk requires an enterprise-wide assessment of threats and vulnerabilities increasingly

aimed at securing dynamic documentary formats. As a result of greater reliance on digital mediums, the move toward more stringent regulation and standardization has found both support and controversy in the archives and records management world. It could safely be assumed that as governments, businesses, cultural institutions, and other organizations become more fully digitized, risk management and compliance will become even more closely connected.

Recordkeeping Innovation, Sydney, New South Wales, Australia

Abstract

The entry begins with general statements on records continuum concepts. It then briefly outlines the evolution of records continuum thinking and practice in Australia because that Australian background helps explain the records continuum model and its points of entry into international discourse. It explores key continuum concepts and provides a detailed exposition of the records continuum model. The use of the model in teaching and research, and its application to professional practice are discussed. The entry also explains how the records continuum model connects to the broader discourses of postmodernism, philosophy and sociology. The entry concludes with a brief discussion of possible future uses and applications of the model.

INTRODUCTION

The records continuum concept of records encompasses records of continuing value (archives) and records in any form. Continuum ideas therefore challenge understandings which differentiate “archives” from “records” on the basis of selection for permanent preservation in archival custody, and definitions of records as physical artifacts in terms of their format or media. Adopting a pluralist view of recorded information, continuum thinking characterizes records as logical objects, belonging to a special genre of recorded information made up of the documentary traces of social and organizational activity. They are accumulated and managed by recordkeeping and archiving processes as record, archive and archives.

All transactions can leave archival traces. They become records when they are stored and managed by recordkeeping and archiving processes. Beyond the immediate business and social contexts which surround records they are transformed into a corporate or personal archive by recordkeeping and archiving processes that “place” records into frameworks for the social and business activities and functions of an organization, group or individual, and manage them in ways that enable them to function as individual, group, or corporate memory. And beyond the boundaries of organizations and individuals, recordkeeping and archiving processes transform the individual or corporate archive by “placing” it into a larger archival framework that enables it to function as accessible collective memory.

Recordkeeping is “a” form of witnessing and memory making, a particular way of evidencing and memorializing

individual and collective lives. Records have multiple purposes in terms of their continuing relevance to an individual, organization, or society. They are vehicles of communication and interaction, facilitators of decision-making, enablers of continuity, consistency and effectiveness in human action, memory stores, identity shapers, repositories of experience, evidence of rights and obligations. On a darker note, they can also be instruments of repression and abuse of power. Whatever function they are performing, their usefulness as evidence is bound up with how they have been created, how they have been captured in recorded form, how they have been organized for distribution and recall, and how widely accessible they are on a continuing basis beyond the confines of the systems managed by records creating agents and their successors. Can records be trusted as accurate, complete, reliable, and authentic sources of information? Can they be recalled and disseminated when needed and do they have integrity? Can users of records be assured that they have not been altered or tampered with? Is information available about related documents, the acts and events which they document, and does it provide links in some way to the wider context of social and organizational activity, and the people and organizations involved?

In records continuum professional discourse and practice, the differences between records on the one hand, and other forms of recorded information on the other, rest on their evidential qualities, purposes, and functionality. From this perspective, the recordkeeping profession and archival institutions in our society are charged with the mission of building and managing frameworks and systems which assure the preservation and accessibility of

accurate, complete, reliable, and authentic records “in” and “through” time and space. The accountability of the recordkeeping profession and archival institutions is therefore a critical issue in democratic societies.

Records continuum thinking takes a multidimensional view of the creation of documents as part of our activities (proto record-as-trace), their capture into records systems (record-as-evidence), their organization within the framework of a personal or organizational archive (record-as-personal/corporate memory), and their pluralization as collective archives (record-as-collective memory). This view is captured in the records continuum model developed by Frank Upward in the mid-1990s. Before discussing that model, the following section trace the evolution of continuum thinking and practice in Australia.

THE EVOLUTION OF CONTINUUM THINKING IN AUSTRALIA

A records continuum approach shares many things with other archival approaches where connections are made between current and historical recordkeeping processes, although sometimes its vocabulary is deliberately provocative in an attempt to disturb preconceptions. For example, a book published in Australia in 1993 used the term “archival documents” in its title as a term to cover both current and historical records, a standard enough usage in some countries perhaps, but relatively rare in Australia. In the opening paragraphs of the book (p. 1), it was noted that:

The effective creation and management of archival documents are critical to their use and the role they play in governing relationships in society over time and space. Their effective creation and management are also preconditions of an information-rich society and underpin the public accountability of government and non-government organisations, freedom of information and privacy legislation, protection of people’s rights and entitlements, and the quality of the archival heritage, made up of documents of continuing value. The concept of the archival document can provide a framework for a greater shared understanding of the nature of recorded information, and of the importance of transactional records to the continuing functioning of a society.^[1]

The book explored a unifying concept of records which is inclusive of archives and encompasses records in any form. It also addressed a key concern of the recordkeeping and archiving communities in the twentieth century in many countries, the recordkeeping-accountability nexus, linked to an emphasis on records as evidence of social and organizational activity. While concerns relating to recordkeeping and accountability are shared by professional recordkeeping communities, the book argued that the divisions in the communities militated against developing recordkeeping professional practice that could meet

society’s accountability needs. The unifying concept of archival documents was intended to be provocative, to challenge the archival and records management divide.

The use of the term recordkeeping by continuum archivists is also provocative. The term is widely used in North America in relation to electronic communications, but is interpreted narrowly in relation to paper based systems and is not inclusive of archiving processes. As used in continuum writings, recordkeeping is broad and inclusive, a form of witnessing, remembering, and forgetting. It encompasses a range of intertwined recordkeeping and archiving processes and activities carried out by records managers and archivists for current, regulatory, and historical recordkeeping purposes. These purposes include the roles that recordkeeping plays in and through space and time in governance and accountability, remembering and forgetting, shaping identity and providing value-added sources of information. In classificatory terms “recordkeeping” in this usage subsumes records management and archival administration. It also encompasses the personal and corporate recordkeeping activities undertaken by individuals in their everyday lives, in families, work or community groups, and in organizations of all kinds. In classificatory terms, recordkeeping runs through records management and archival administration in recurring and equally present fashion. It cannot simply be subsumed as a subordinate activity within either area of activity. The continuum approach tries to avoid the threat posed to recordkeeping and archiving processes if the professional drive of archivists and records managers to separate their disciplines is allowed to override the recordkeeping and archiving needs of particular systems and situations.

Gene Pool

The first clear examples of continuum-based practice in Australia were in the Commonwealth Archives Office in the 1960s. Ian Maclean, the Chief Archivist, noted retrospectively that a hallmark of the Office’s operation was its drive to seek a “continuum of (public) records administration” from administrative efficiency through recordkeeping to the safe keeping of a “cultural end-product.”^[2] MacLean’s reference to the continuum is far from the *Shorter Oxford English Dictionary* definition:

A continuing thing, quantity, or substance; a continuous series of elements passing into each other.

However his approach had genuine continuum-based components. He provided Australian archivists with a topology, a continuing logic for the study of the formation of archives in any place, in any time, and in whatever form, emphasizing three key elements—the characteristics of recorded information, classification processes and recordkeeping systems. The characteristics of recorded information of most interest to archivists are authenticity

and reliability as the basis for evidence-based decision making and public accountability. Classification is the basis for records construction as well as retrieval, and is based on knowledge of organizational functions, activities and processes. Maclean's recordkeeping system emphasis was grounded in the registry tradition and also reflected the organizational and methods approaches of the time.

Maclean's proto-continuum implementation model challenged emerging professional differences between archivists and records managers. He argued that the archival profession has three branches. One branch, registrars, worked in government departments designing recordkeeping systems and maintaining survey data about where records were being created and kept. Members of this branch in his mind were the "true archivists" because they were the ones most directly involved in the archival formation process. Another branch, described as historical recordkeepers, worked in archival institutions. A third branch liaised between the current managers of recordkeeping processes and the historical recordkeepers. The three branches brought recordkeeping and archiving processes together into a style of records continuum management.^[3] One of Maclean's colleagues, Peter Scott, provided the final element in continuum management in the CRS (Commonwealth Record Series) or series system, an archival system of registration that could control recordkeeping objects at any point in time from creation in agencies through to custody in government archives.

In the 1970s this system was at its peak. A strong evidence-based recordkeeping culture had emerged in the Commonwealth Archives Office. Staff engaged in the evolution and implementation of Scott's CRS system developed rich understandings of the web of multiple social, functional, provenancial, and documentary relationships established during the ongoing creation, management and use of records. For a number of reasons including changing technologies, and changes in management emphasis within the Commonwealth Archives Office (known as Australian Archives from 1984), the approach began to wane in the 1980s. New managerial approaches moved away from reliance on registry systems which tightly controlled and integrated business and recordkeeping processes, and downplayed the ethical responsibility of public servants to document their actions.

The Second Generation

In the 1990s when archivists in Australia were challenged by electronic recordkeeping issues, there was a renewed interest in the proto-continuum implementation models of Maclean and Scott. As was being discovered simultaneously by both Australian and North American archivists, in electronic recordkeeping environments, authenticity and reliability issues could not be addressed at the desktop—they needed to be dealt with through systems design and implementation tactics.

Authenticity and reliability issues were also a particular concern in Australia in the early 1990s. At that time the findings of a number of Royal Commissions and major inquiries into a series of accountability crises in government and the corporate sector in the 1980s were released. They focused attention on the role of recordkeeping in supporting democratic and corporate accountability. Complementary questions included: what constitutes accountable recordkeeping, what types of organizational and societal risks are associated with failures in recordkeeping, how can recordkeeping professionals demonstrate the causal links between poor or negligent recordkeeping, and failures in accountability, how can recordkeeping professionals play a part in addressing the need for evidence based decision-making in all spheres of life, and how can the role of public archival authorities as accountability players in democratic societies be safeguarded?

Emerging continuum-based frameworks for the management of electronic records and understandings stemming from preoccupation with the recordkeeping-accountability nexus drove the development of standards for accountable corporate recordkeeping regimes within the Australian community during the mid-1990s, in particular AS 4390, the *Australian Standard: Records Management*.^[4] They also fed into reviews of archival law and the dual role of public archival authorities at national and state level in managing accountable public recordkeeping and the archival heritage. The University of Pittsburgh's "Functional Requirements for Evidence in Recordkeeping Project," in particular Bearman's formulation of a mix of policy, standards, system design, and implementation tactics to satisfy them,^[5] also significantly influenced the Australian standard. AS 4390, elements of which were later picked up in an International Standard (ISO 15849), continued the Australian practice of being transactionally focused, emphasizing the links between activities and functions and related records, but did so in a media independent fashion. The Australian recordkeeping profession is still taking a lead role in developing recordkeeping standards, including standards that link recordkeeping to business processes as part of the formation of archives, e. g. standards relating to work process analysis, functional analysis, and organizational analysis. There was a particular synergy between the work of Bearman,^[6] understandings of recordkeeping systems derived from the registry tradition in Australia, and Maclean's legacy. In continuum practice, recordkeeping system requirements are specified in terms of capturing the content of documents, representing their structure, and linking related documents together. The information content and structure of records at their point of creation needs to be retained in reconstructible relationships. A cumulating history of events documenting the subsequent, management, access and use of records is essential. As more archival traces are incorporated into the record, more documentary and contextual links and relationships need to be captured and

documented. Recordkeeping systems thereby enable records to be retrieved at a later date in a form that represents their original content and structure, exposes their documentary relationships, and reflects their multiple contexts of creation, ongoing management and use, thus preserving their evidentiary nature.

By the early 1990s the use of the term records continuum was becoming ubiquitous in Australia. This usage followed the publication of Atherton's groundbreaking article that showed how the life cycle stages that records supposedly underwent were in fact a series of recurring and reverberating activities within both archives and records management.^[17] At the same time records continuum literature^[8–12] began to expand and engage in discourse across archival boundaries, both geographical in terms of the archival profession, and professional in terms of cognate disciplines. In particular, continuum writers engaged with the writings of Duranti on European archival theory and diplomatics,^[13] and of Hedstrom,^[14] McDonald,^[15] and Hofman^[16] relating to the early implementation of electronic recordkeeping policies and strategic approaches in New York State, Canada, and the Netherlands respectively. Cook's writings on postcustodialism and appraisal, grounded in Canadian re-conceptualizations of provenance, also provided a touchstone for Australian records continuum thinkers.^[17,18] As did Ketelaar's writing in relation to societal and cultural frameworks.^[19]

Records continuum approaches to building holistic, multidimensional frameworks for integrated recordkeeping and archiving processes were informed by the synergies between these discourses. Australian understandings of the nature of records as evidence, and the integrated recordkeeping and workflow processes associated with registry systems were also significant inputs. As were the

concepts of multiple provenance and the rich and dynamic views of records present in the CRS system, as further developed and refined in the work of Chris Hurley.^[20]

THE MODEL

The records continuum is most commonly represented in the seminal model form (Fig. 1) developed by Frank Upward with input from colleagues Sue McKemmish and Livia Iacovino and first published in 1996. As indicated in the preceding sections, the model is representative of a more complex body of thought which came before it and has continued to develop since its publication.

Of key importance in understanding the model, and the continuum approach embedded within it, is the notion of transactionality. In continuum thinking it is defined in terms of the many forms of human interaction and relationships that are documented in records at all levels of aggregation. It encompasses individual acts of communication, and social and business transactions of all kinds, the social and business activities or processes of which they are a part, the social and business functions they fulfill, and the social purposes they serve.

The archival document [record] can be conceptualised as recorded information arising from transactions. It is created as a by-product of social and organisational activity in the course of transacting business of any kind, whether by governments, businesses, community organisations or private individuals. ... The documentation of transactions may be in any storage media and is increasingly an electronic process. In Australia and North America, the use of the terms "records" and "archives", to refer to current

Fig. 1 The records continuum model.

Source: Structuring the records continuum, Part One: Post custodial principles and properties, by F. Upward. In *Arch. Manuscripts* 1996, 24(2), 268–285.

archival documents and archival documents selected for preservation respectively, has created a distracting division within the recordkeeping profession between records managers and archivists. The unifying concept of the archival document encompasses both records and archives. It directs attention to the continuum of processes involved in managing the record of a transaction so that it retains its evidentiary quality... (p. 1).^[1]

The model is explained below using a dimensional (circles) then an axial (lines and points) view. The explanation works from the first dimension outwards to the fourth dimension, but it could equally be written from the fourth to the first dimension. The records continuum is not linear, although for the purposes of explanation it might sometimes seem to be.

The Dimensions of the Records Continuum

This explanation draws substantially from an article by Reed.^[21] Table 1 summarizes the dimensions of the records continuum.

The first “create” dimension of the records continuum model represents the locus of all action, including representations of actions in documents. This dimension provides a perspective on things that are in the process of formation, may exist in versions or as partial expressions. The document has the potential to move beyond the locus of creation, but as yet this potential is nascent—all the elements required for robustness are present but not explicit. Until the connections are explicit, the document cannot be managed as a record.

The beginnings of that journey to robustness occur with transition into the second “capture” dimension when the document is communicated or connected through relationships with other documents, with sequences of action. With characteristics from the second dimension, records, now attest to action and are able to be distributed, accessed and understood by others involved in business activities. The transition to the second dimension may be formal or informal, may involve a deliberate act of registration in organizational systems, or may be an intention represented by placement or grouping. Here contextualizing metadata elements are added and the record is able to be referenced or drawn upon by others. The first and second dimensions of the model can be thought of as the immediate zones of interaction and the recording of that action.

The third dimension, the “organize” dimension, represents an aggregation above individual instances of sequences of actions, investing the record with explicit elements needed to ensure that it is available over time and beyond the immediate environments of action. Here, a record joins multiple other records deriving from multiple sequences of actions undertaken for multiple purposes. This is the dimension of the “archive” or

the “fonds,” the whole, extant or potential, of all of the records of an organization or individual cumulating to form organizational or personal memory. At an implementation level, this is the dimension of policy or rule establishment which will affect the “create” and “capture” dimensions.

The fourth or “pluralize” dimension represents societal perspectives on recordkeeping—the cultural, legal, and regulatory environment of recordkeeping, which is different for every society and in every period. Recordkeeping does not occur in a social, cultural or political void. The environment of recordkeeping external to a specific locus of records action, and the memory and evidence paradigms of a particular time and place, critically determine the nature of the record. The fourth dimension also represents the capacity of a record to exist beyond the boundaries of creating entities, to meet the needs of those not involved with the actions precipitating records creation, capture, and organization. Pluralization processes enable records to be reviewed, accessed and analyzed beyond an organization or individual life, for multiple external accountability and memory purposes in and through time and space.

The Points in the Records Continuum

The words in the model should be thought of as points around which many other words and definitions can cluster, revealing an increasingly complex array of issues of critical concern to recordkeeping, rather than as prescriptive signifiers. The points can be connected in a multiplicity of ways to represent the dynamic relationships between records and their rich, complex and multilayered social, functional, provenancial, and documentary contexts of creation, management, and use in and through space and time. In the records continuum model these concepts find expression in a range of continua described in Table 2. In the original representation of the model, the points were plotted along four axes, but later versions represent only the points, not the lines.

A records continuum approach acknowledges the need to discuss and describe recordkeeping objects in conventional ways, but tries to put that discussion and description into relational contact with other concepts and with the functioning of systems that create, capture, organize, and pluralize the objects. Records can be described with the assistance of different points in the continuum, including memory as it is contained in records, the way they are managed and classified in accordance with the identities of those involved in activities, and their connections with transactions that are the subject of recordkeeping processes.

The evidential continuum opens up many questions for records managers, archivists and others. Does a recordkeeping object provide a trace of action, can it testify to the events it documents (in many different places, not just courtrooms), and what does it witness? Even more

Table 1 The dimensions of the records continuum model.

Dimensions	Concerns addressed in the dimension
Dimension 1: Create [archival] documents-as-trace <i>The first dimension encompasses the actors who carry out the act (decisions, communications, acts), the acts themselves, the documents which record the acts, and the trace, the representation of the acts.</i>	In the first dimension, acts, communications and decisions are documented. Document creation and control processes are implemented which: • capture structure (documentary form) • order and place documents in their immediate context of action and facilitate their retrieval • store documents and provide for their security.
Dimension 2: Capture records-as-evidence <i>The second dimension encompasses the personal and corporate recordkeeping systems which capture records (documents in their contexts of action) in ways which support their capacity to act as evidence of the social and business activities of the units responsible for the activities.</i>	In the second dimension, recordkeeping processes and systems are implemented in accordance with the design requirements, standards and best practice models set up in the third and fourth dimensions. Implemented processes and systems: • capture records at specified points in business processes (when predetermined “boundaries” are crossed) • capture and maintain the metadata required to assure their quality as records of business and social activity (i.e. metadata that places them in relation to other records and links them to their context of activity), and to manage their usability (completeness, accuracy, and reliability) and accessibility through time • deliver records for use through time according to relevant access permissions, and user views • store and secure records through time.
Dimension 3: Organize records-as-corporate memory <i>The third dimension encompasses the organization of recordkeeping processes. It is concerned with the manner in which a corporate body, organization or individual defines it/her/his recordkeeping regime and in so doing constitutes/forms the archive as memory of its/her/his business or social functions.</i>	In the third dimension, recordkeeping concerns involve: • identifying personal and corporate requirements for essential evidence to function as personal/corporate memory • establishing recordkeeping regimes in the personal or corporate domain • developing organizational knowledge bases and classification schemes that represent the personal and corporate contexts of recordkeeping • putting in place storage and migration strategies that carry records through the life of an organization or a person • developing access strategies that manage access according to the rules of a particular personal or corporate domain.
Dimension 4: Pluralize records-as-collective memory <i>The fourth dimension concerns the manner in which the archives are brought into an encompassing (ambient) framework in order to provide a collective social, historical, and cultural memory of the institutionalized social purposes and roles of individuals and corporate bodies</i>	In the fourth dimension, recordkeeping concerns involve: • identifying social and cultural mandates for essential evidence to function as collective memory • establishing recordkeeping regimes that can carry records beyond the life of an organization or person • developing knowledge bases and classification schemes that represent the broadest structural and functional contexts of record keeping • putting in place storage and migration strategies that carry records beyond the life of an organization or a person • developing access strategies that manage access across jurisdictions.

The words in italics in the first column are cited from an article by Upward^[22] and those in the second column from an article by McKemmish.^[23]

tantalizingly difficult to ascertain, how heavily is it memorialized—inscribed into individual psyches, used by groups and organizations? And most dynamic of all, is it fighting with or fitting into other forms of individual, corporate or collectively accessible memory?

The continuum of transactionality raises many professional recordkeeping issues, with the points providing

different levels of analysis for such matters as appraisal, metadata, and classification schemes.

The continuum of identity raises general questions about how we see ourselves and how we relate to the groups, organizations and wider societies to which we belong. Significant issues relating to privacy and openness are brought into play. In a more pragmatic sense, for

Table 2 The points in the records continuum model.

Points	Explanation
<i>Continuum of recordkeeping objects:</i> [archival] documents, records, the corporate and individual archive, and the collective archives	Represents recordkeeping objects—the [archival] document, i.e., the documentary form in which it is created, the records system in which it is captured, the individual or corporate archive and the “plural” (collective) archives.
<i>Evidential continuum:</i> trace, evidence, corporate, and individual [whole of person] memory, collective memory	Represents the quality of recordness, the role that the record plays as trace, evidence, organizational/individual memory, and encompassing collective memory—in informing, witnessing and memorializing.
<i>Continuum of transactionality:</i> act, activity, function, purpose	Here the act (decision, communication, act) forms part of a business or social activity or process, which in turn is part of a business or social function which is an aspect of a higher-level social purpose or ambient function.
<i>Continuum of identity:</i> actor, work group/unit, organization/corporate body, and institution	Represents the actor, the unit (person or group with the corporate or socially assigned authority or power to undertake an activity or play a role in relationship to other units), the organization (a corporate body established to perform certain functions or an individual acting as a legal entity) and the institution (the broad social domain, jurisdiction or competence with reference to which the authority may be exercised or the role played).

The words in the second column are drawn from an article by Upward.^[22]

archivists, identity is significant for purposes of representation, recall and dissemination. Does the data kept about recorded information include and utilize information about the actor, the unit, the organization and the institution? How effectively is that data garnered and used by recordkeeping systems?

The Model in the Broader Intellectual Discourse

The construction of the records continuum model had some grounding in the broader philosophical and sociological discourses of the time. For example four French academics—Jacques Lacan, Michel Foucault, Jacques Derrida, and Jean-François Lyotard—were in vogue in academies in English speaking countries and the model has a genetic connection to all of them.

To Lacan^[24] the model owes its determination to find an accurate and useful topology, a logical structure for the stretching of information and data into different recordkeeping objects. The circles in the model represent the changing shapes of the documentary objects in information stores, a very Lacanian depiction of through-time stretching processes that he sees as part of personality formation, but in the continuum relate to archives formation. Lacan’s famous metaphor for this process in psychoanalysis is the doughnut and the needle, the shapes of the female and the male. At conception we all have the shape of the female, and the needle in fact retains that shape but in apparently different form.

The circles of the model can also be read as thresholds that might or might not be crossed in the manner of Foucault’s thresholds for the process of knowledge formation.^[25] He writes of the irregular manner by which discursive formations build across the thresholds of “positivity” (positive statements about something),

“epistemologization” (arrangement within dominant groupings of statements), “scientificity” (the making of laws for the construction and testing of statements), and “formalization” (when the laws become axiomatic, existing as starting points for statements and shutting out other statements). This view helps explain why Gilles Deleuze at the time this book was published called Foucault the “new archivist.” He placed considerable importance on the way a discursive archive builds up control over discussion by the manner in which participants in it file documents as monuments in a multidimensional, controlled, and controlling manner.

The model’s development also involved a technique for deconstruction which can be called post-Derridan in that the intention is to derail the ingrained habit so common in modern thinking of defining words in terms of the pairing of imagined opposites.^[26] Whenever you have a discourse settling in to dualisms such as archives and records, interpolate a third point into the discussion and relate the other terms to it. Using that technique many pairs of words that are defined in opposition to each other suddenly reveal a wealth of similarities and differences. The interpolation of third points can also be called continuum mathematics, and in the model this grew into interpolating other points, establishing a multiplicity of relationships. The model as a tool can also be linked more directly to Derridan thinking by pausing on words, their use in different places and times, and the spaces that surround them (Derrida’s work, *Archive Fever: A Freudian Impression*^[27] was being drafted in the same time frame as the model itself and therefore had no impact on the development of the model).

Groundings of this type were part of the play of ideas involved in the model’s construction, and no tight academic connections are being claimed. When the model was first presented in print, however, attention was drawn

to Lyotard's^[28] recommendation to use the following approaches to challenging settled discourses:

- Think problems through from every possible direction using conventional analytical techniques (analysis)
- Accept new shapes for our thinking (anamorphosis)
- Sometimes accept solutions because they feel right (anagogy – for Lyotard, for example, it was beyond debate that society's memory banks should serve justice even if we will never achieve consensus about what justice means)
- Be willing to accept that some forgetting needs to be part of the process (anamnesis).

While one can develop transcendental readings of the model relating to aspirations for future professional practice, the model will always provide a critical way of assessing what is actually being done. This capacity for different readings is what makes the model an open one. Continuum philosophies are monistic, offering single explanations, but paradoxically their monadic nature deliberately encompasses diversity. They provide a single metanarrative, but never exclude other metanarratives. This postmodern position, a form of relativism first put by the philosopher Samuel Alexander in 1920 in his epic treatise, *Space, Time and Deity*, has been subject to inconclusive debate in philosophy ever since. Indeed the perpetually postmodern aspect of continuum theory means that debate on it will always be inconclusive.

Attempts to address the metaphysics of the spacetime continuum are taking place across many disciplines, but one of particular relevance to archivists given the close connection between the formation of archives and the modes of operation and survival of social groups, is sociology. One of the most widely read sociologists of the last quarter century, Anthony Giddens, explores spacetime issues at great length and depth.^[29] Giddens' structuration theory deals with the ongoing relationship between our actions and the structures in which they take place. It is a time space theory dealing with the transmutation of structures, the reproduction of social systems, and, most significantly for archivists, the role of recorded information in these processes. In particular, Giddens' ideas suggest that recordkeeping and archiving professionals should be concerned with both the fixity and the mutability of records, and with the persistent and the contingent nature of record-keeping. The records continuum will always be with us but to the professionally functioning archivist, it does not present itself in the same way in different times and places. At present it is not being managed well. Evidence based decision-making systems are collapsing and many people are suffering as a result. To appreciate this, consider those retirees whose superannuation depended upon the shares of the failed company Enron, or the citizens of Iraq invaded, it was said, because of the existence of weapons of mass destruction. In these examples the expanding complexity

of the spacetime continuum have led to complex changes to corporate operations and the conduct of foreign affairs and war, and these changes have outstripped our capacity to manage the records continuum in matching complex ways.

USES OF THE MODEL

Rather than allowing us to think in convenient pairs or binaries, the model encourages consideration of the multiple potential points of recordkeeping intervention and actions. It brings much more complex layers of implicit and explicit meanings to the fore, and importantly enables exploration of the space revealed between the points, opening out a range of possibilities. The model allows what is actually occurring in different environments to be brought in to the discussion. All its spaces and silences make it a very democratic and global instrument inviting anyone to relate to the points in the continuum from any perspective and to enter into a discussion irrespective of their cultural background or professional experiences. Alternatively, and equally, those with sophisticated understandings can convey their developed ideas easily and quickly:

The critical importance of the continuum rests on five factors: 1) its conceptual interaction of the sixteen levels and axes too often viewed in archival circles as separate and static; 2) its insight that these complex relationships are fluid, multiple, and simultaneous across time and space, not sequential and fixed; 3) its reconciliation (with some adjustments as suggested) of evidence and memory; 4) its potential for imaginatively incorporating private-sector manuscripts with institutional archives; and 5) its assertion through pluralization that societal and thus cultural values will influence appraisal and, indeed, all aspects of record-keeping.^[30]

The model is at its most useful when it is made to dance as the Australian archivist, Chris Hurley, once observed. Those who cannot or do not want to make it dance see only circles and words with spaces in between them. But choreographing its dimensions and points reveals complex relationships which are "fluid, multiple, and simultaneous across time and space,"^[30] not sequential and fixed. Relationships between evidence and memory between the private and the corporate, between the archive as an instrument of restriction and the archives as a liberating force can be discussed within its framework in both practical and speculative fashion.

CURRENT USE OF THE MODEL

The records continuum model can serve as metaphor, as a topological model to repattern archival knowledge and reshape professional practice, and as a topographical or implementation model.

As metaphor, for example, it turns the recursivity of action represented in Atherton's continuum insight into a constant return to the moment in time when action occurs. The notion of recursiveness unlocks many different perspectives on recordkeeping processes through spacetime. Examples of the model's use as a topological model are provided below, including its application as a teaching and training tool, and research instrument, and its role in reshaping professional practice in Australia. The proto-continuum implementation models of Maclean and Scott are discussed in the first part of this entry. Their legacy and the use of the Upward model as a topographical model are exemplified in Australia in the development of recordkeeping standards, metadata entity-relationship models and schemas, and best practice guidelines for the design of recordkeeping systems and appraisal programs.

Teaching Tool

The model has been successful as a teaching tool, spreading into educational and training programs worldwide. As a pedagogical tool it provides a framework for interpreting records and archives thinking and practice. For example, the international and national records management standards, developed to serve plural frameworks (the fourth dimension of the model), establish compliance requirements and community expectations for accountable corporate recordkeeping and archiving regimes which need to be implemented in ways that take into account the creating, capturing, and organizing recordkeeping processes (the other three dimensions of the model).

Scott's CRS of series system provides a fourth dimension framework for processes implemented throughout all the dimensions for carrying records beyond the life of an individual or organization. It does so by enabling the representation of the broader structural, functional, and documentary contexts of records' creation, management, and use. The Canadian Total Archives Concept and function-based macro appraisal strategies provide a fourth dimension framework for the incorporation of personal and corporate archive(s) from all sectors of society into the collective archives, enabling them to function as the collective memory of the whole nation.

The records continuum model is also widely used as a training tool opening up discussion about positioning the participants' practice and potential action strategies. Many continuum-based case studies have been developed to explore records continuum practice, the ubiquity of recordkeeping in society and community expectations for recordkeeping.

Research Instrument

Particularly noteworthy is the model's use as a conceptual model and an analytical research tool by researchers around the globe in archival and records management

studies. For example it has been used as a conceptual framework and analytical tool in the development of the Australian Recordkeeping Metadata Schema (ARKMS) as part of a collaborative research project involving Monash University, the National Archives of Australia and State Records NSW.^[31] The records continuum model played a similar role in the development of the US Inter PARES metadata schema and archival descriptive standards registry, MADRAS,^[32] and the Australian Clever Recordkeeping Metadata Project.^[33] Iacovino used the model to analyze the recordkeeping-law nexus^[34] and to explore complex cross-organizational electronic transaction systems.^[35] Oliver employed it, and its sibling the information continuum model, as a research instrument to analyze and present her findings on the influence of national culture on information management in Australia, Germany, and Hong Kong.^[36] Outside Australasia Dunbar has proposed using it as part of opening up Critical Race Theory issues^[37] and it is being used in a number of Northern European informatics research projects.

Reshaping Professional Practice

The model is a Rorschach test, allowing practitioners to understand, think about, and implement recordkeeping and archiving actions. It provides a concise way to express concerns in a shared framework, opening up further thinking and action. It challenges recordkeeping professionals to rethink recordkeeping and archiving processes as recursive actions imparting the characteristics of recordness on any object, in any format, which needs to function as a record-as-evidence or record-as-memory.

Appraisal ceases to be about evaluating the value of a record for evidential and informational purposes from an archival perspective. Rather it becomes a multifaceted, recursive process which begins with defining what should be created (first dimension), what should be captured and managed as record (second dimension), what should be managed as a part of individual or organizational memory (third dimension) and what should be pluralized beyond organizational or individual memory (fourth dimension). Appreciating that records are constructs rather than physical realities, we can begin to see that records can have many manifestations, equally valid over time, in multiple different sequences of action, each of which creates individual records out of potentially the same record object. This understanding of appraisal has been incorporated into Australian practice through implementation of the national and international records management standards, AS4390 and AS/ISO15489,^[38] the development of the DIRKS (Design and Implementation of Recordkeeping Systems) methodology, and the appraisal programs of the National Archives and state archival institutions. The DIRKS methodology was developed by the State Records Office of NSW for use in that State, and is now also

mandated for use in Commonwealth government agencies by the National Archives of Australia.

Description is no longer a post hoc archival process applied within the walls of an archival repository, but one which is continuously building connectors between business transactions, activities and functions as the record is formalized for sharing in wider spaces and across longer periods of time. This process commences as a record is first created (first dimension), becoming more formalized at the first point of capture of a record (second dimension), continuing to occur as records are shared beyond the initial process that created them, within the organization (third dimension) and beyond the organization (fourth dimension). It is undertaken by multiple applications of recordkeeping metadata to maintain the connections to the creating business actions the records evidence and memorialize. This continuum view of description informs the development of national and international metadata standards and schema. The model Australian Recordkeeping Metadata Schema was implemented in standards developed by State Records NSW^[39] and the South Australian Archives,^[40] and more recently in work undertaken by Standards Australia which was adopted as Part 2 of the new International Standard for recordkeeping metadata, ISO 23081.^[41] The ARKMS continuum-based metadata model was also used as a conceptual framework in Part 1 of ISO 23081.^[42]

Preservation cannot be left until records are within a protective custodial space. Archives are increasingly virtual, perhaps never existing as a physical place. Records must be built to withstand the pressures that sustaining them will bring. In electronic systems this implies attention to formats, documenting links with other records, people and processes in ways that will be sustainable over time, and enabling the management of objects independently from the software that created them. Preservation becomes multiple recurring actions designed to provide flexibility for different ways of maintaining records and their authenticity in a world where no ultimate archiving solution does, or ever will, exist. This continuum view of preservation can be seen in increasing attention to migration processes and standard formats for storage in records management functional specifications emerging in Australasian jurisdictions. It is also reflected in organizational concern over continuing support for older proprietary software formats. Records continuum thinking is particularly relevant to the digital preservation community as it increasingly turns its attention to managing digital objects from their point of creation. New digital technologies can enable captured records to be stored simultaneously in multiple physical domains—and thus in both business and archival contexts. Projects such as VERS (the Victorian Electronic Records initiative) extend models of custodial preservation into an active collaborative approach consistent with records continuum practice.

Socially the concept of access to records has undergone the most significant restructuring of all our recordkeeping

processes. It has evolved from being a tightly controlled and monitored archival process of permission to use records to being a process continually negotiated and renegotiated depending on what, why, and when access to records is sought. On the one hand, notions of transparency and accountability have shifted the locus of access and security to different implementation points in the continuum. On the other, social and community interests still protect and define rights associated with use which are highly dependent on circumstances—think of the response to accessing government information post 9/11 or increasing individual rights over access to and use of our personal information. Emerging records continuum approaches to access can be seen in increasing attention to modeling access and security permissions in current records systems, an increasingly complex process in the face of decontextualized digital identities. The beginnings of more formalized articulation of access permissions as a component of recordkeeping in all contexts can be seen in the ISO 15489-2 recommendations for creating formalized instruments for such purposes. Tagging of records as available for public access from the time of their creation is now a reasonably commonplace workplace reality.

CONCLUSION

In discussing the nature and uses of the model we have indirectly indicated that as a way of analyzing recordkeeping systems the model can be given a forensic focus (looking over the past to find records, relationships and meaning), a clinical focus (for example, assessing whether appropriate records are being created and maintained) or a speculative focus to identify imminent changes or transcendental views of the future (for example thinking about recordkeeping in emerging technological environments). In other words it can claim to be a genuine continuum model in that it can be used to address the past, the present, and the future. It can also be used to analyze the relationship between particular issues and archiving and recordkeeping processes, as the research examples above indicated. Each style of analysis has its place in knowledge formation and in working out what skills are required for particular tasks. These uses will continue into the future, but two areas of use are likely to have particularly strong future relevance. Those relate to archival informatics, and to paradigms for forming knowledge about archiving processes.

The records continuum model was designed to open up thinking about the formation of archives and the way documents are shaped, stretched, and re-created into different archival forms within different technologies. Thus it copes comfortably with an increasing emphasis upon informatics, an emerging science dealing with the application of technologies across our activities. In any era and place this will always include the technologies used in

creating documents, capturing them and other information objects as records, organizing them into individual bodies of records (the archive), and bringing the archives together in plural holdings. These “stretching” processes have been occurring in some way or another ever since people began to dance, sing, paint, and carve in ways that recorded transactions and passed on ways of doing things through generations. The record within the continuum is “always in a process of becoming,” and also of dissolving.^[43] In a twentieth century filing system, for example, they might be stretched into new shapes and structures during the filing and aggregating processes that form them. In emerging service oriented approaches, recordkeeping is being disaggregated into component functionality, operating on logical objects at multiple points and in recursive ways, stretching them into new configurations constructed through multiple relationships. Disposal and new administrative patterns can alter their physicality and the control and attention that they receive, and disposition is never final. Records no longer extant or moved elsewhere can still be observed in the place they once occupied through data about their life history or their connection with events. They have multiple lives in spacetime as their use and control alter and open up new threads of action, reshaping and renewing their creation and disposition.

The model can provide a take-off point for visualizing different multidimensional and interconnected topographies. The four interconnected processing dimensions, creation, capture, organization, and pluralization, are always going to be present in any worthwhile informatics project, albeit within a transdisciplinary framework involving many more points to pause upon than the records continuum model itself provides. The difference between archival informatics and archival science is that, whereas the latter concentrates on archival functions as understood by archivists over the ages, archival informatics is still something of a clean slate. From a continuum perspective it involves the application of technology to recordkeeping and archiving processes in and from any era and will lead to a large-scale reconstruction of archival activities.

In modern systems, depending upon the requirements and analysis of the specific technologies involved, the functionality of system selection and deployment can be directed at achieving multiple recordkeeping ends. Building regimes for managing records in such environments involves consideration of every dimension of the records continuum model, and often a rethinking of our professional recordkeeping processes. Ways and means will differ but the aim is still to create appropriate documents in the first place (first dimension), store them as reliable and accessible records in ways that link to the fluidity and ongoing nature of our activities (second dimension), store them as an archive at organizational or personal archive levels (third dimension) and enable cross organizational and personal connections and workings, as well as allowing for multiple patterns of access (fourth

dimension). We happen to be on the threshold of archives formation within the multidimensional places of inscription and consignment provided by Internet and web-browser technologies. We need to seize the opportunities present in our emerging technologies to form archives in continuum fashion.

As a paradigm the continuum provides a way of thinking based on the ongoing and expansionary states of being (more strictly speaking of becoming). The records continuum model is meant to be paradigmatic in this largest of ways, moving from notions of the archives as an end product to an emphasis upon the never-ending process of archiving, with particular emphasis upon recordkeeping and the maintenance of records about our actions. If archivists are to play a real-world role in the construction of the archives in the future, they need to repattern their professional practice with reference to the ways organizations and individuals build their stores of knowledge (their archive), the processes of recordkeeping and archiving, and the role recordkeeping professionals play in these processes. The battles between fixity and fluidity, between traditional views of the record and modern views of free floating information are no longer meaningful. Our technologies can manage both fixity and fluidity and give both characteristics to our recorded information in many locales, including electronic reading rooms and desktops. A focus on “becoming” reveals ways of managing an end product that more of us can now see was never actually an end product anyway.

The need for transmission of recorded information about our actions into different times and spaces is a survival issue for our species, not just a faddish endeavor. To support survival—and that is what is at stake in the formation of archives—information professionals involved in recordkeeping and archiving processes need to be diverse in their approaches, capable of undertaking different styles of analysis, and work within robust and inclusive paradigms for knowledge formation. They need to operate using the technologies of their times and places allied to an understanding of the technology of the eras they happen to specialize in, including present eras and places. As indicated above, the records continuum model opens up perspectives on all these things. Like many schematic drawings, however, it is a tool that is only of value when it is being used.

Records Organization and Access

Sue Myburgh

School of Communication, University of South Australia, Adelaide, South Australia, Australia

Abstract

Records, as documents which provide evidence of business transactions that have taken place, are collected and preserved for as long as they are useful to the organization, or as is demanded by law. In order to be useful, however, they must be organized in such a way that they can easily be identified, located, accessed, and used, for whatever purpose. First, the records must be described by identifying the most useful salient characteristics; then, they are categorized in various ways, according to their age, function, level of confidentiality, privacy and security, and access to them controlled according to these categories. Records may be arranged by one of several ordinal systems, usually involving letters and numbers, but also color: these symbolically represent the characteristics that are considered as important descriptors. Thus, records can be accessed (or protected from access) by their category; they can be located by correspondence between terms (which may be words or numbers) used to describe characteristics and terms used in searching for particular records or records series. These principles apply to both physical and virtual records.

INTRODUCTION AND BACKGROUND

The work of records management comprises capturing the records produced by an organization by distinguishing them from documents, and describing them; ensuring that they are disseminated to those who require them for action; providing access to them while at the same time keeping them private and secure as necessary; discarding them when they are no longer required, or passing those with historical value to the archives for long-term preservation once their value has been appraised. Records are usually organized by some element of description; access takes place both through the organizational systems as well as constraints, and processes suggested by law or administrative purpose.

The International Organization for Standardization (ISO), in their standard ISO 15489: 2001, defines a record as “information created, received, and maintained as evidence and information by an organization or person, in pursuance of legal obligations, or in the transaction of business.” Typically, this information is contained in a document of some kind, of whatever medium or format. The important characteristic of a record that differentiates it from other documents is that it provides evidence of a business transaction. This is usually interpreted by records managers as the ability of a record to provide evidence by the mere fact of its existence. However, besides providing evidence, records are also the documents used (primarily for the information they contain) in order to conduct the business of an enterprise, thus, records are closely associated with general document management strategies with an organization, as well as workflow processes, as they

facilitate the work of the organization. There is increasing interest, however, in the informational qualities of records from the strategic information management point of view. Records are valuable, therefore, for three reasons:

1. Their existence provides evidence of transactions undertaken (or not);
2. They facilitate the work—processes, procedures, and communication—of an organization (both internally and externally);
3. They contain valuable information which can be used to increase competitive advantage.

When records are no longer actively used in any of these fundamental ways, most of them are discarded and destroyed. However, there will certainly be a group of records which are considered to have an historical value, and these will, in due course, be managed in an archives.

It is worth noting that there are different records management traditions internationally. In the United States, for example, there is a clear distinction between records managers and archivists and their work, while in Australia there has been considerable movement towards uniting the two professions, largely through the enunciation of continuum theory.^[1,2] In Europe, there is a focus on archival work and preservation, with not much attention being paid to current records, although there is increasing interest in such issues. Work is still required to reconcile the various approaches, in spite of the existence of an international standard, and some of these differences are articulated in various organization and access arrangements. However, archival organization, arrangement, and access (such as

fonds, original order, and provenance) are excluded here. Also excluded is discussion of metadata for records, except insofar as it is related to organization, arrangement, and access.

RECORDS ORGANIZATION

One of the major functions of records management is to describe and organize records. Good organization of records is vital: ISO 15489 recommends, “The higher the level of accountability and/or public scrutiny, the greater the need for accuracy, and speed in locating individual records.” [This applies to all three of the essential functions of records: as evidence, as information, and as tools to facilitate the work of the organization. In particular, good organization is required if records are to be acceptable as evidence in a court of law: the system must be consistently implemented, for example, and each record must be complete, identifiable, coherent, accessible, and available (amongst other criteria)].

It is possible to organize records in many ways. One way which seems obvious is to arrange records by the structure of the organization or by the subject with which the record deals. However, both of these methods are subject to a number of problems, particularly because the organizational structure or nomenclature might change. Overall, a functional approach is most commonly adopted. This method of categorization is predicated upon the processes that are identified as critical to the mission and tasks of an enterprise, incorporating the tasks required to perform them. The categories therefore reflect the functions of the organization, which may be, for example, the following:

- General administration.
- Establishing policy.
- Accounting.
- Budgeting.
- Managing contracts and agreements.
- Information and communication technology support.
- Human resources management.
- Manufacturing.
- Goods and services procurement and supply.
- Arranging travel.

In this way, records can be grouped by activity and will relate to the work undertaken by each department. There are several advantages to this approach.

1. Analysis of individual documents (or document series) is avoided, as the principle of division becomes the functions and workflows of the organization;
2. The business context of the record is more-or-less self-evident, often clarifying issues of privacy and security;

3. There is a logical coherence to this style of organization which assists in eliminating duplication;
4. Within each function, file series can be more easily identified and, once these have been approached, disposal of such files is more easily managed as a whole file can be discarded at once, avoiding the need to examine each document within a file.

RECORDS SERIES

The notion of functional classification or organization of records is associated with the concept of “records series.” A records series is a group of related records (such as the minutes of a particular committee) which can be filed as a unit. The records in a series are usually uniform in both form and function, and often cover a particular unit of time (e.g., a financial year or a decade). They can also be appraised as a unit and scheduled for disposition—which makes such tasks simpler. So, there is a logical and useful connection between the categorization, filing, accessing, evaluating, and scheduling activities of the records manager. Functional organization, based on records series, is used in both analog and digital environments.

Classification and Indexing

Records classification occurs after business functions and activities have been identified and categorised, according to the standard structures, procedures, and processes of the organization. The thesaurus provides common administrative support terms, rather than terms that describe core business functions in organizations. This means that the record is classified according to why it exists and where it was created, rather than its information content, which may only be suggested by organizational functions and processes. This differentiates records from other documents, such as monographs or journal articles, which are primarily categorised and indexed according to the subject of their content.

As previously suggested, a classification scheme, based on organizational functions, assists in the other records management activities of appraisal, disposition, security, privacy, and so forth. At the same time, the classification scheme will indicate the location of specific documents, and connect physical and electronic documents that are functionally linked. The process is otherwise similar to the classification and indexing processes undertaken in libraries and other document management centers.

There remains the problem, however, of how to deal with files and folders (and indeed, individual records) at finer levels of granularity and specificity. For these purposes, classification schemes are developed, which can use either alphabetical or numerical notations (and often

both—for different purposes). A classification scheme suggests that similar things can be grouped together in categories, and any relationships between categories are indicated, such as in a hierarchy. Before the classification scheme can be finalised, however, a taxonomy must be created, which articulates the topics and subject categories, as well as their structure. After this, each category can be briefly described through use of notation—which could be words, letters of the alphabet, or numbers. These elements in turn can be used as a basis for the filing arrangement.

Deciding on the appropriate word or code to assign a particular record, or series is guided by the vocabulary selections made in a thesaurus, which controls how the records are classified or indexed. The thesaurus must first, of course, be constructed: this can be a time-consuming process. It involves an analysis of business hierarchies and functions, interviews in order to determine terminology, selecting and developing the terminology, and ensuring its consistency. It is essential that the thesaurus reflects the requirements of the organization and its staff. Once the terminology has been selected and approved, this controlled indexing language is recorded in the thesaurus, ensuring that terms are used consistently, and in the same manner.

A records management thesaurus pays little attention to the information content of a record, however; as noted, it is more important for these purposes to classify the record according to its context and why it was created, rather than what it is about, even though the information content of records can be valuable for strategic purposes. There is nonetheless increasing interest into systems that reveal the subject of such documents as well as meeting the more traditional requirements of records management, so that organizations can compete more successfully.

In Australia, the State Records Authority of New South Wales developed a Keyword AAA Thesaurus intended for use by all agencies of government, as it contains terminology common to the business functions and activities of most enterprises. In this way, records that are common across the state, but found in a range of agencies, will all be described in the same way. Indeed, it has been found to have such general applicability that it has been used, either in its entirety or as a basis for other thesauri, throughout Australia and internationally. It is intended to be used with a functional thesaurus that specifically deals with the functions, activities, and procedures of a particular office or agency—thus, extending its flexibility of use.

All business classification schemes, as recorded in a thesaurus, must include all the functions of the particular enterprise, but not be related to various departments; the terminology should be widely used and familiar to all staff; ideally should be hierarchical (proceeding from broad categories to specific items); and should be constantly maintained. It can then be used by all staff to index the records they create and receive.

Indexing

Using the thesaurus as a guide, the record can be described, identifying the document as well as providing the mechanism for arrangement, retrieval, and disposition. Increasingly, electronic records management systems allow for the storage, retention, and searching of the complete, full-text document, which to some extent assists in access but is not helpful for retention and disposal purposes. That records are managed primarily for their evidential properties must never be forgotten.

Filing and Arrangement

The arrangement of records or files—whatever their medium—should be kept as simple as possible, so that all can understand it. This helps at all stages of locating and returning records. Deciding on a filing system, first of all requires determining what descriptor will constitute the filing element: will it be the indexing term, a sequential numbering system, the name of the department from which the record originates, or the surname of the action officer? What must also be borne in mind is how the filing system will identify linked files if they occur in a variety of media and formats, and so are not all found together in the same place.

A most useful work which explains filing in great detail is Suzanne Gill's *File Management for Information Retrieval Systems: A Manual for Managers and Technicians* (1993).^[3] This comprehensive work, now in its third edition, includes how and why various filing systems might be chosen and used. She includes alphabetical filing (and the differences that various filing rules can make, either letter-by-letter or word-by-word); numerical filing—including serial, middle digit, and terminal number; chronological (subject and alphabetical); alphabetical subject and hierarchical subject; phonetic filing, geographical filing, and color-coded filing.

Records Access

Records must, of course, be made accessible to the employees of an enterprise to enable them to do their work. In a physical, or paper-based environment, the record will be sent to an action officer who can perform the work required by the document; the action officer might also need to access records which have already been dealt with—perhaps only partially—and will recover these either from the records center or by the records management system. The records manager keeps a close account of where all records are at any particular time—as well as who the record might be passed on to prior to returning to the file. This process is known as tracking, and this can be either manual (like a circulation system) or automated (often through the use of bar codes).

Generally speaking, the question of access is associated with controlling the distribution or circulation of physical records within an organization. Access management systems are usually designed to work with records series rather than individual documents. It is, however, necessary to ensure that rights of access to records and to functions are granted to authorized individuals and groups and withheld from unauthorized individuals and groups. Access management aims to strengthen privacy and security while facilitating information sharing.

Access to records can, however, be differentiated in a number of ways. For example, there are different issues and procedures related to access to physical records, as opposed to digital or electronic records. There are also different ways to manage access to active, semiactive, or inactive records. Other dimensions of access include the ease with which an individual can understand the descriptions of records, and how they have been arranged, so that the correct record can be identified and located without the constant intervention of the records manager. In addition, there is the issue of controlling access, so that records remain uncorrupted by unauthorized amendments or deletions.

The information that records contain, which, as previously noted, has largely been ignored by records managers for the most part, is clearly a concern here, as it is the information (rather than the physical artifact) that must be protected from violations of privacy and security. These issues are covered by a number of international laws and regulations (so much so that some records managers feel that their more appropriate title should be “compliance officer”!). On the other hand, there are also laws that specifically permit access to records about people (such as Freedom of information legislation) and governments, after certain periods of time have expired. Yet, another issue that controls access to records is that of intellectual property, as many companies would not wish to have their information (as intellectual capital) made widely available. There are additionally specific issues of records access management and control related to particular industry sectors, such as health, nuclear power, the military, and chemical industries.

Access, security, and privacy

Many systems that provide access to information permit only selected persons to exercise access. It is frequently the case that some records may never be allowed to leave the organization; some may only be seen by certain individuals or certain categories of staff, for a range of reasons, such as privacy, organizational or national security, industrial espionage, and so forth. These restrictions may be put in place either manually or electronically. Records contain evidence of business transactions and many activities that must remain confidential, and may also possess personal, commercial, or other sensitive information. It will be necessary to manage access to these records to

ensure compliance with the regulatory environment and corporate policy, and in accordance with the organization’s security policy. With reference to access, the main areas to be considered are freedom of information, privacy, security, and intellectual property (which includes copyright, trademarks, and patents).

Freedom of information legislation has to do with providing citizens access to information (particularly about themselves) which is held by government bodies. Each country has its own suite of legislation which controls these aspects. In the United Kingdom, for example, there are Public Records Acts and a Code of Practice on Records Management for Freedom of Information; in the United States there is the 1966 Freedom of Information Act, and the 1996 Electronic Freedom of Information Act Amendments.

Privacy laws seek to control potential misuse of personal information. The European Community, in 1995, issued the European Directive on Protection of Personal Data, and in the United States there is the Code of Fair Information Practice issued by the Office of Technology Assessment. Privacy in the United States is also controlled by the Health Insurance Portability and Accountability Act (1996), the Fair Credit Reporting Act, and the Electronic Communication Privacy Act. Security of information continues to be an issue, as instances of identity theft rise, as well as the possibility that trade or other secrets might be stolen and used inappropriately. Authentication (by either security framework or by some kind of electronic signature) is increasingly required, and the transaction—the request for access to a particular record or record series—can be recorded.

Access to physical records

Active records (in other words, records that are still being used by action officers on a regular basis) can be controlled through a tracking system, as the location of a file or document must be known at any time (One of the great disadvantages of the physical artifact is that it can only be at one place at a time, and this has led, rather dangerously sometimes, to many duplicate copies being made, which may fall into the wrong hands as they are difficult to control). Tracking systems can be manual or automated. Some examples of manual systems are:

1. File movement book registers, which are hopelessly inefficient and have mostly been replaced.
2. Separate file movement card for each file, held in one sequence. These are a little better, but they are held outside the file which means users must make an effort to sign them.
3. File movement markers—placed into the file storage area in place of a file when that file is taken by a user. This is widely used.

However, all of these systems rely on the users providing the necessary information. Automate tracking systems

offer much better control over materials and are easier to use (especially by the action officers). They work in the following way.

- Each user is allocated a borrower's code.
- The electronic recording of file movements may be centrally controlled or may be done at remote workstations by departmental users.
- Remote recording of file movements can eliminate the need for other usually inefficient methods of informing records staff that a document or file has been handed on to someone else.
- Many systems incorporate bar code tracking of documents and/or files. This works like the library's circulation system. A portable bar code reader can also be used to carry out a file census. The records staff member enters each office, passes the reader over the user's bar code, and then over each file in the office.

Resubmit systems allow files to be returned to users (action officers) on a predetermined date for follow-up action. This is necessary when, for example, annual reminders need to be sent out. Users can book a file to be sent (or submitted) to them by a particular date.

Once records become semiactive or inactive, they are usually moved to a "records center," which is a central storage area where inactive records are kept. This could be on-site, which is common for small or medium size companies, but more commonly such records are moved off-site, which may be managed by the company itself or by a commercial records management center. The choice can be determined by, inter alia, costs of leasing or purchase, insurance, power and other overheads, staffing retrieval times, protection against the elements and disasters, security, growth rate, and general convenience.

Access to electronic records

More and more work is done in digital format only, in both public and private enterprises. Part of the notion of an "information society" is that of "e-government" or "e-democracy," in which governments at all levels—local, state, and federal—are encouraged and obliged to make their documents easily available to the public at large. Electronic records can be easily transmitted using information and communication technologies, and this makes them more vulnerable to modification and destruction. There also remain a number of uncertainties with regard to the long-term preservation of digital documents.

CONCLUSIONS

As long as paper is used, questions of physical organization, arrangement, and filing will be important. How to

identify and locate individual records or records series is an important issue in records management. A great deal of work is currently being undertaken to protect and preserve electronic documents and records, and this will continue, as will increased interest in using the information contained by records for competitive advantage.

Records Retention Schedules

Barbara E. Nye

Ictus Consulting, LLC, Pasadena, California, U.S.A.

Abstract

Records retention is managed within an organization by developing and implementing a records retention schedule. A records retention schedule is a list of records maintained by an organization and the length of time that the records must be retained. It is a policy document that states the organization's intent to maintain its records for defined time periods and to disposition them systematically once the time period is reached. Thus the retention schedule supports compliance activities within the organization, promotes transparency and good "corporate" governance.

The purpose of the retention schedule is to manage each records series throughout its "life cycle"—the creation or receipt of the record through its disposition. Proper management of each records series ensures that the growth of records is controlled; that is, records are available as long as they are required to support the business need or to comply with a statutory or regulatory requirement and they are dispositioned when they have met these two requirements. Thus, records do not accumulate unnecessarily, and the organization does not incur the costs of maintaining obsolete records. Additionally, removing obsolete records routinely and systematically helps the organization to avoid the appearance of willful destruction, obstruction of justice (in the event of a pending legal action) and thus serves to limit the organization's legal liability.

INTRODUCTION

Records retention is a key element of a comprehensive records management program. It consists of determining how long to retain a record (the retention period), maintaining that record so that it is retrievable and useable over the defined time period, and when the retention period has been met, destroying the record or—if it has historical value—transferring it to an archive. The process of records destruction or transfer to an archive is called "dispositioning."

Records retention is managed within an organization by developing and implementing a records retention schedule. A records retention schedule is a list of records maintained by an organization and the length of time that the records must be retained. It is a policy document that states the organization's intent to maintain its records for defined time periods (or, in some cases, until an event occurs) and to disposition them systematically once the time period is reached or the event occurs. Thus the retention schedule supports compliance activities within the organization and promotes transparency and good "corporate" governance.

The records retention schedule is the basic tool used in performing records retention activities and an appropriate records management tool for all organizations: private enterprise, government agencies, cultural institutions, or non-profit groups.

The schedule is typically organized by "records series," a group of related records that are maintained or used as a

unit and that can be evaluated as a unit for retention purposes.^[1] The time period for maintaining each records series is called the "retention period."

A comprehensive retention schedule includes all records in all stored formats, including, for example, paper-based, electronic, and photographic records, as well as physical objects (e.g., soil or water samples, scale models, etc.) that are determined to be records.

Records retention schedules must be customized specifically for an organization. There are no "generic" records retention schedules that can be used "as is."^[2] Although organizations may produce many similar type records, especially for those functions such as accounting or human resources management that are common to most organizations, the differences in industry regulations, geographic locations, legal jurisdictions, and especially the "corporate culture" are all factors in determining how long an organization is prepared to maintain records, or conversely, at what point in time the organization is comfortable destroying records deemed obsolete.

PURPOSE

The purpose of the retention schedule is to manage each records series throughout its "life cycle"—the creation or receipt of the record through its disposition. Proper management of each records series ensures that the growth of records is controlled; that is, records are available as long as they are required to support the business need or to

comply with a statutory or regulatory requirement and they are dispositioned when they have met these two requirements. Thus, records do not accumulate unnecessarily, and the organization does not incur the costs of maintaining obsolete records.

Additionally, removing obsolete records routinely and systematically helps the organization to avoid the appearance of willful destruction or obstruction of justice (in the event of a pending legal action) and thus serves to limit the organization's legal liability.

RETENTION SCHEDULE TYPES

There are two basic retention schedule models based on the method for organizing the records series—the “departmental” model and the “functional” model. Other types of retention schedules, such as “process-based” or “large aggregation” schedules are a variation on the functional model. There are advantages and disadvantages to the development and maintenance of each model.

A records series is a group of files or documents kept together (either physically or intellectually) because they relate to a particular subject or function, result from the same activity, document a specific type of transaction, take a particular physical form, or have some other relationship arising out of their creation, receipt, maintenance, or use.^[3]

Departmental Retention Schedules

Traditionally, records retention schedules have been organized by the business unit (department) where the records were identified during the records inventory process. Therefore, the “departmental” retention schedule organizes the record series alphabetically by the business unit (department, division, or section) in which the records are maintained and to which responsibility for maintenance is assigned. This type of retention schedule is also called the “detailed retention schedule” because it generally has a greater number of records series (more “detail”) than a functional schedule. Departmental retention schedules are still in wide use because they are relatively easy to develop. The business unit uses its own terminology for the records series name, sets an operating retention period to meet the business unit's needs, and there is no need to classify the records series.

A disadvantage in using departmental retention schedules is that they require maintaining not only multiple schedules per organization (one for each business unit) but also significantly more records series, as the same records series is often maintained by many business units in an organization. For example, contracts, expense reports, and some personnel records may be maintained in many different business units and thus must appear on many schedules. It is not unusual for an organization

maintaining multiple departmental retention schedules to identify and maintain hundreds or perhaps thousands of records series. Different business units may assign conflicting retention periods to the same records series, which can be a liability when trying to defend retention practices. An additional requirement is that the departmental retention schedules must be revised each time there is a re-organization.

Functional Retention Schedules

The “functional” retention schedule classifies each records series by the “function,” or purpose, that the records series serves. Schellenberg^[4] defines functions as “the responsibilities assigned to an agency to accomplish the broad purposes for which it was established.” Within each function the records series are listed alphabetically.

The functional retention schedule approach eliminates tracking of duplicate records series, as each series is listed only once, associated with the appropriate function. Thus the functional schedule generally contains significantly fewer records series. Skupsky^[5] states, “The typical functional retention schedule for even a large organization will contain under 100 different retention categories. . . .”

In addition, the functional retention schedule does not have to be significantly revised each time there is a re-organization; only the ownership information, or “office of record,” may require revising. However, developing a functional retention schedule requires collaboration from each business unit to agree on the naming conventions for the records series, on the retention period, and on the “owner” or “office of record”—the unit that is responsible for maintaining and dispositioning the records series. An additional step is required in developing a functional retention schedule as the records series must also be classified into the appropriate function. As with any classification initiative, functional retention schedule development is part art and part science.

Large Aggregation Retention Schedules

A more recent development in records retention schedule theory is the so-called “big bucket” or large aggregation approach to developing records retention schedules. This approach is based on the theory that maintaining fewer records series promotes more efficient and more accurate classification of records into the proper records series and thus promotes compliance. The U.S. National Archives and Records Administration (NARA), which provides records management expertise to federal agencies, has embraced this approach to ease the perceived burden of using and maintaining the traditional retention schedule.^[3] This approach is somewhat controversial and has not been widely adopted.^[6]

Records management software application vendors are strong proponents of this approach. To support successful

implementation of an electronic document management system, an enterprise content management system, or other automated recordkeeping system, vendors urge their customers to simplify retention requirements.^[7] The users of that system must select the appropriate category (records series) to classify records, in order that the system can automatically impose retention times and systematically disposition the electronic records.

As the volume of records created and maintained steadily increases (due to the ease of creating and distributing electronic records) and as the burden for classifying records by records series is increasingly placed on individual employees, the manual application of the retention periods becomes extremely labor-intensive and time-consuming. If there are too many records series “choices,” the user has difficulty accurately and consistently classifying the record. Thus there is pressure to reduce the number of “places” where users can classify their documents.

In developing a large aggregation retention schedule what defines a records series changes. Instead of being “a group of related records that are maintained or used as a unit and that can be evaluated as a unit for retention purposes,” large aggregation retention schedules are organized by very broad functional categories containing many records series or, in some instances, by the retention period.

For example, multiple records series classified into the “Accounting” function on a typical functional retention schedule (e.g., accounts payable, accounts receivable, and general ledger records), are combined into one big bucket, “Accounting” records series. The longest retention period of the various accounting records series that have been classified into the new larger “bucket” is assigned to the entire group. The disadvantage to this approach is the risk that many records will be maintained much longer than is strictly necessary. Another strategy is to establish the organizing principle for the “bucket” as the retention period. A few retention periods are selected (e.g., one-year, five-year, ten-year, and “permanent” time frames), and all records are classified into the “buckets” by time period rather than by record subject matter or function.^[6]

A disadvantage to this strategy, in addition to maintaining many records beyond the time they are useful is that it does not accommodate the application of events in considering how long to keep the records. Rather this strategy relies on a fixed time frame for calculating retention which may not adequately span the time until the event occurs.

Report format

There are also different retention schedule report formats. For example, schedules can be presented as simple alphabetical lists of record names, in a descriptive paragraph format, or in a table format.

Traditionally the records retention schedule has been maintained as a “stand-alone” document published and distributed by the records management group within an organization. More recently, database technology has been used to maintain retention schedule data and to publish the retention schedule report as a hardcopy report or as a file posted on an organization’s intranet site.

Report content

In addition to the records series name and retention period, schedules may also include descriptive information about the records series. For example, schedules can contain:

- The office of record—the group within the organization that is assigned responsibility for maintaining the records series.
- The basis for the assigned retention period—an administrative or operating requirement, a legal statute, or agency regulation.
- Separate time periods for retaining the records series “onsite,” for transferring records “offsite,” for destroying records, and for duplicate copies.
- Records storage formats (e.g., paper, microfilm, digital).
- Records destruction requirements (e.g., shredding).
- Access, preservation, or security requirements (e.g., records are “confidential”—access must be restricted; or “historical”—records have research or social importance beyond the business and legal need; or “vital”—records must be available to respond to an emergency or disaster).
- Notes or comments.

RETENTION PERIODS

A retention period is the length of time, usually stated in terms of the number of years, that records must be maintained to meet operating, legal or fiscal requirements of the organization.^[1] Many records series must be maintained until a certain event has transpired. In some instances retention periods are a combination of the event plus a set number of years.

A retention period based on a finite time period (such as a certain number of years) is used when it is known that the records will not be needed past that time frame. A retention period that is based on an event is used when the retention time that the record is required is based on the occurrence of an event or on a circumstance whose date cannot be predicted. For example, for the records series, “Personnel Files,” the retention period would be governed by the event that was the end of employment, or “termination” (the event). The termination date of employment cannot be accurately predicted. Therefore Personnel Files would have a retention period

of “Termination,” or a number of years after that event (e.g., “Termination plus 5 years”).

The retention period is sometimes further delineated into the time period to retain the records in the working environment (e.g., office, workstation, online), a time period for retaining records in a lower-cost storage area (e.g., a warehouse for paper-based records, a climate-controlled vault for photographs or microfilm, or off-line storage on tape for digital records), and a total retention time.

DEVELOPMENT

In order to manage its records, the organization needs to understand what records are maintained and how they are used. The information needed to have this understanding is collected during the development of the retention schedule in a process known as the “records inventory.”

The first step in creating the retention schedule is to prepare a plan that describes the strategy for the retention schedule. This strategy should include determining:

- The scope of the retention schedule—which parts of the organization will be inventoried (e.g., all operations, domestic operations only, headquarters office only), what storage formats are used for records (e.g., hardcopy only, electronic, photographic)
- The type of retention schedule to be developed—departmental or functional
- The type of information to be collected
- The records inventory method to be used—detailed physical inventory, high-level survey approach, or questionnaire
- The resources needed to develop the retention schedule—in-house staff, outside consultants, or a combination
- A project schedule for development
- The type of approval—the level of internal management, external counsel, or board of directors approval required
- The method of implementing the retention schedule—for example, one business unit at a time or one location at a time

Records retention schedules can be developed using one of several methods: a detailed physical inventory, a questionnaire, a high-level overview or “survey,” analysis of business processes, questionnaires, or a combination of these methods. Regardless of the type of retention schedule and the exact method of schedule development, the basic need is to understand what records exist and how long they must be retained.

The inventory process collects information about the records that can be determined by a visual inspection (e.g., the volume of records stored, and their physical condition) and by interviewing knowledgeable individuals

in each business unit (e.g., concerning records usage, electronic records creation or maintenance, government reporting requirements, if any, and litigation history). The type of data collected varies depending on decisions made during the development of the records retention schedule strategy. It can include, for example:

- Names of the files and documents
- Storage location
- Storage equipment
- Volume of records
- Date range
- Condition of the records
- Storage format (paper, microfilm, electronic, photographic)

The interview process collects information about the use of records, frequency of reference, computer applications that create or store electronic records, problems encountered with finding or storing records, government regulatory requirements for preparing, reporting, or maintaining records, and the records required to respond to legal actions.

The inventory and interview data are analyzed to develop records series, the building blocks of the retention schedule. Once the draft version of the retention schedule is complete, the following activities complete the schedule development process.

Legal Research

It is necessary to establish the legal jurisdictions that apply to the organization in order to understand which recordkeeping statutes and agency regulations must be followed. The records management function of the organization can research these requirements as well as consult with legal counsel to establish what the legal recordkeeping requirements are, if any. Not all records are governed by statutes or regulations. The retention period for the majority of records series is determined by the business need to refer to the record (sometimes referred to as the “operating” need). The legal requirements are considered with the business need and the longer of the two time periods is selected.

Review and Approval

Once the first draft of the retention schedule is completed, it is issued to the business units and to legal counsel for review and comment. The retention schedule is then revised based on the comments received and then issued to the appropriate group within the organization for approval (executive office, legal department, or governing board).

Implementation

Once approved, the records management function within the organization applies it to the organization's records, matching the record series to the physical or electronic records maintained and culling obsolete records from their stored locations. This begins the systematic process of destroying obsolete records (those records whose retention period has been met).

Maintenance

Periodically the records management function of the organization completes the retention schedule review and update process to incorporate new record series and new legal requirements, to add in changes that have occurred in the organizational structure affecting the responsible department (office of record), and to delete record series which are no longer maintained. The frequency of update will vary from one organization to another depending on the frequency of change to governing statutes and regulations and to the internal business practices.

CONCLUSION

Records retention has been called “. . .the defining responsibility of records management as a business discipline.”^[8] The primary tool used in records retention activities is the records retention schedule. Developing and implementing the retention schedule are fundamental activities of a records management program.

The retention schedule is the official policy that allows an organization to effectively manage its records and it is the primary building block upon which other program components are constructed.

The retention schedule categorizes and describes the organization's records and how long they must be kept. Maintaining a comprehensive retention schedule is key to managing records to ensure that they are available for use as long as they are needed, and are destroyed (or transferred to an archives, if historical) when no longer needed, thereby avoiding costs associated with uncontrolled records growth, limiting legal liabilities, and promoting operational efficiencies.

Reference and Informational Genres

Thomas Mann

Library of Congress, Washington, District of Columbia, U.S.A.

Abstract

In order to reduce the problems of information overload, librarians and indexers have created systems of categorization that allow large numbers of individual books or articles to be perceived initially through smaller numbers of categories of literature. These categories can be either subject or format groupings. Format designations are particularly useful in segregating reference works from larger collections or retrievals. The distinctive nature, and the purposes and uses of reference works (“tertiary literature” composed of 60% or more of files or lists, as opposed to “primary” or “secondary” literature) are discussed. The mechanisms for finding such works via *Library of Congress Subject Headings*, or via the peculiarities of their shelving in either the Library of Congress Classification or the Dewey Decimal Classification, are explained. “Publication types” and “document type” searches within databases covering formats other than books are also treated.

The phrase “reference and informational genres” refers to types of literature that are distinctively formatted in such a way as to expedite the discovery of particular kinds of information. Such genres include almanacs, atlases, chronologies, dictionaries, encyclopedias, and so on, that usually present informational content in brief, segmented displays, rather than in connected narratives or continuous expositions.

The need for such genres arises from the fact that efficient research cannot be done in large, unsorted collections of resources, whether printed or electronic. Some kind of categorization of the material is necessary to prevent information overload. While the mind cannot grasp huge numbers of individual items in relationship to each other, it can more easily discern relationships among broader—and fewer—*categories* into which the items may be sorted or assigned.

In book literature, for example, one can get a better sense of what is or is not contained within the category of works on “Afghanistan—history” if one can readily see that subdividing categories other than “history” per se have been created for country’s “antiquities,” “boundaries,” “civilization,” “economic conditions,” “foreign relations,” “geography,” “intellectual life,” “politics and government,” “social life and customs,” and so on. That is, one can more readily discern what may be contained within a “history” of Afghanistan category by being able to note, quickly, the relationship of this category itself to an array of all the other subject-aspects that impinge on “history” without being included by it. (These particular categorizations are all formal terms within the *Library of Congress Subject Headings* system.)

The segregation of large collections of resources into smaller and more manageable “chunks,” however, is not solely accomplished by the creation of *subject* groupings;

it is also brought about by *format* and *genre* categorizations. In the same example, a researcher interested in “Afghanistan—history” may, in a large research library, still be overwhelmed by too much material within that subject itself; but further subdivisions of the topic into types of literature such as “Afghanistan—history—bibliography,” “—chronology,” “—dictionaries,” “—encyclopedias,” can provide the additional options needed to make the various aspects of the “Afghanistan—history” group more perceptible and manageable.

Format and genre groupings thus allow very useful discriminations to be made on a basis other than subject content: on the one hand, they enable immediate focus to be directed toward some particular types of relevant resources “within” a subject; on the other, they enable whole groups of irrelevant sources to be immediately excluded, which would otherwise remain as cluttering elements if only subject (rather than format/genre) categories were available to choose from. In this same example, still other format designations (“personal narratives,” “pictorial works,” “registers of dead,” “songs and music,” and so on) may appear as subdivisions of “Afghanistan” directly—e.g., “Afghanistan—pictorial works” rather than “Afghanistan—history—pictorial works,” thus allowing other relevant *genre* categories to be recognized in the same roster in which *subject* subdivisions appear.

The major types of format and genre categorizations used in the library field were initially developed as mechanisms to sort and characterize literature contained in books; but similar or analogous types of category designations have been created to prevent, in comparable ways, the retrieval of “too much” information within other kinds of knowledge records. (For example, within journal literature it is possible to focus on, or filter out, letters-to-the editor, book reviews, editorials, etc. from conventional

“articles”—points that will be discussed below.) The present entry therefore starts with a consideration of mechanisms for sorting book collections, and then moves on to consider nonbook resources.

Several key formats and genres within book literature are traditionally distinguished:

Almanacs. These contain miscellaneous data and information for quick look-up purposes. They are good sources for information concerned with statistics, awards, historical dates and anniversaries, geography (i.e., basic data on countries, states, large cities, and natural features such as mountains, rivers, volcanoes), sports records, flags, lists of governmental agencies and officials, directory information for consumers, information on national or world figures, brief chronologies or overviews of world historical events, astronomical data and calendars, postal information, basic world maps, and so on. Almanacs are particularly useful for answering questions having to do with *who, what, when, and where* when only brief, objective information is required.

Atlases. These are usually compendiums of maps that display information graphically and spatially. Maps can show not just national or political relationships but also data on atmosphere and weather, temperature and rainfall, climate variations, crop production, vegetation, soil conditions, biodiversity, ecological changes, mineral concentrations or distributions, geologic processes, fishing patterns, military power balances, wars and conflicts, status of women, literacy levels, technological levels, population trends, occupational distributions, trade patterns, spread of diseases, health levels, standards of living, area histories, and the like. Many atlases also include representations of astronomical information on stars and constellations, the solar system, planets, moons, comets, and so on. (The term *atlases* is also sometimes used in an older sense, referring to compilations of statistical tables rather than maps.)

Bibliographies. These are compilations of citations to books, journal articles, conference papers, dissertations, reports, and so on. They may be *enumerative* (listing works from a country or other locale, from an author, or from a printer), *descriptive* (providing details of the physical characteristics of published works), or *subject* compilations. The latter are usually assembled by experts who have specialized knowledge of the topic, and so the listings in subject bibliographies are often annotated with descriptive summaries or evaluative notes on the intellectual content of the works cited. A particularly valuable feature is that these bibliographies may include many sources that lie beyond the range of database indexing. They serve to provide overviews, often comprehensive, of the extent of literature on a topic; and, being compiled by human scholars rather than machine algorithms, they often provide readers with a better survey of research options than computer printouts can supply. They usually have some arrangement or categorization of entries

reflecting something of the internal structure or chronological development of the topic itself, an overall mapping of parts or aspects of the subject that cannot be captured or conveyed by automated term-weighting. Frequently subject bibliographies have detailed indexes revealing additional connections among the citations that are not apparent from the structured order of the listings within the body of the bibliography. Bibliographies compiled by experts, in short, are often much better than databases in providing starting points for research, or initial overview listings of resources. They are especially important in historical and literary research.

Catalogs. Catalogs provide listings of objects rather than bibliographic citations; the objects may be merchandise, art objects, equipment, machine parts, professional or art/craft supplies, and so forth, that are located at particular places or that are available for sale. Catalogs, like bibliographies, may also list publications; but catalog listings are usually for publications as physical objects residing in a particular place. Catalogs often provide descriptive details, technical specifications, and prices of the listed objects.

Chronologies. These present historical facts arranged by the time sequence of their occurrence. Some chronologies present parallel listings that display the developments within different areas of interest (e.g., politics, arts, technology, and religion) simultaneously, so that a reader may correlate the events of one area with contemporaneous, earlier, or later developments in other subject areas.

Concordances. These are alphabetical lists of individual words derived from particular texts (usually literary or philosophical classics) that enable researchers to determine exactly where any particular word or words appear within the text.

Dictionaries. These provide an alphabetically arranged list of words with their definitions, pronunciations, etymology, scope of usage, variant forms or spellings, and so on. Often they contain biographical and geographical names. Their scope may vary from coverage of an entire language to a focus on only the technical terms or jargon of a particular subject area. The term “dictionary” is often synonymous with “encyclopedia,” referring simply to an alphabetical (rather than a systematic) arrangement of entries, regardless of whether the entries are brief and factual or lengthy and expository.

Directories. Directories are sources for identifying and locating individual people, organizations, or institutions; they list persons or corporate bodies that are situated in certain geographical areas, or that are related by thematic, professional, commercial, or subject concerns. Nowadays they usually list names, addresses, telephone and fax numbers, e-mail addresses, Web home pages, or other contact data; and they may provide basic information about an individual’s qualifications and background, or an institution’s purposes, history, and internal structure. Directories may

be arranged alphabetically, geographically, or numerically (e.g., by telephone numbers or street addresses).

Encyclopedias. Encyclopedias are usually compilations of information in expository form in articles arranged alphabetically. The articles are generally intended to provide concise (rather than exhaustive) overview-summaries of the basic facts on a subject, written for an audience of nonspecialists who do not start with any prior knowledge of the subject or its technical jargon. Encyclopedia articles, too, usually provide brief bibliographies of basic works rather than exhaustive lists of all relevant sources. The aim of an encyclopedia, as a whole, is to summarize established or objective knowledge at a level comprehensible by lay people, and to provide a starting point for more extensive or in-depth research. The scope of individual encyclopedias may vary from attempting to survey all knowledge in all fields to focusing on particular subject areas or academic disciplines. (Note that encyclopedias specialized in a particular *subject area* still tend to be written with a nonspecialist *audience* in mind.) Subject encyclopedias, as a form, may be contrasted to treatises, which also attempt to survey entire subjects, but which do so exhaustively (rather than concisely) in both their texts and bibliographies, in a systematic (rather than alphabetical) order of presentation, and at a level of detail appropriate to specialists. Encyclopedias often include cross-references among articles, and frequently have detailed indexes that reveal specific data and interrelationships not discoverable by the alphabetical arrangement of the articles themselves.

Gazetteers. These are alphabetical dictionaries of geographic place-names; entries often include brief descriptions of the history, population, economic characteristics, and natural resources of the places listed. Gazetteers are also useful for identifying the larger geopolitical units in which a smaller locale is included (e.g., an entry on a town name will also designate the county, state, or other larger district of which it is part).

Handbooks and manuals. These are a type of information source intended to be easily transportable for actual use “in the field” rather than just in libraries. They are related to encyclopedias and treatises in that they try to provide the principles and important facts of a subject area, and in that they can be arranged either alphabetically or systematically. Their major distinction from these other forms is their emphasis on practice, procedures, and other “how to” directions for producing actual results or specific identifications of natural objects (plants, birds, botanical specimens, etc.), rather than just broad intellectual understanding. Also, they tend to be much more concisely written, as well as formatted in smaller-sized volumes, so as to be more easily carried about in field situations.

Newsletters. These are sources for current information in fields that develop or change rapidly. In print form, they appear daily, weekly, or monthly.

Sourcebooks. These are compilations of primary sources relevant to a particular topic or subject area. They conveniently assemble in one place original documents important to an understanding of the history or development of the subject, often with introductions that provide context and point out relationships not apparent from the texts themselves.

Union lists. These are location devices; they enable researchers who have already identified specific sources to determine which libraries (or other repositories) actually own a copy of the desired works. They are like catalogs in that they list physical objects; but the items recorded in union lists are drawn from multiple institutions in different locales.

Yearbooks. This type of literature seeks to provide a record of the year’s developments in a particular field, often with evaluative commentary on what has transpired. Such annuals are often cumulations of the updating information contained in newsletters, but with more structured arrangement, additional introductory material, and better indexing; they are also usually produced as hardbound volumes to serve as permanent replacements for the ephemeral newsletter formats they may cumulate or supersede.

Many other formats and genres have also been customarily distinguished within book-format literatures. The *Library of Congress Subject Headings* roster provides numerous standardized form categories; note that in each instance in the following list, as with the above roster, the particular *subject* of the work to which these designations can be given is not relevant. (One obvious qualification is in order, however, some format and genre designations do have defined subject *scope ranges*—i.e., a form designation such as “description and travel” may have wide applicability within works on geographical topics, but not be appropriate at all for works in biology or physics.) Among the many traditional form and genre subdivisions, in addition to the above list, are

A practical problem for librarians arises in distinguishing *reference* genres within the larger roster of all form and genre designations. That is, within the entirety of a library's book collection, librarians need to create subcollections of *reference books* segregated from the general collections, and located in close proximity to the reference staff whose job is to provide quick information on some topics, and overall guidance into the larger collections not immediately at hand.

Although every book may be said to contain information, not every one qualifies as a *reference book* on its topic. Format and genre considerations come into play here, although not *all* format and genre considerations. "diaries" and "correspondence," for example, are labels indicating formats (rather than subjects), but not formats that would be considered appropriate for assignment to a reference collection. The "history" label is less clear cut. In one sense, "history" is a subject in itself (as distinguished from, say, "anthropology" or "religion"). In another, however, "history" is indeed a format designation, indicating a presentation of information in connected narrative sequence, as opposed to other presentation possibilities ("encyclopedias," "quotations," and "pictorial works"). Even if "history" is regarded as a form, however, all histories cannot possibly be shelved in working reference collections, which have particular space limitations.

How then can librarians make practical distinctions of reference genres from other informational genres? Two considerations are generally useful. The first is the distinction among *levels* of literature: primary, secondary, and tertiary. *Primary literature* is generated by participants in a particular activity or event, recording their original impressions, experiences, observations, experiments, or creative expressions. *Secondary literature* is generally comprised of either popularizations or scholarly analyses of the primary literature; it is based on surveys of, or research into, primary sources. *Tertiary literature* consists of works that identify, point out, summarize, abstract, compile, or repackage the information provided by the

other two levels. As Ranganathan^[1] has pointed out, they are works intended to be consulted for one or more of their parts, rather than read through consecutively and completely. Reference works, such as almanacs, dictionaries, chronologies, and encyclopedias, are usually at this third level.

A second distinction between reference genres and others is provided by a particularly insightful analysis by Bates.^[2] "Reference books," she writes, "have traditionally been defined administratively (e.g., as books that are noncirculating) or functionally (e.g., as books used for reference), rather than descriptively (i.e., in terms of the essential characteristics that distinguish reference books from other books)." She then provides a very useful definition of reference books based on their organizational structure: they are

books that contain a substantial percentage of their length—operationally defined... as 60 percent or more in pages—in files and/or lists. Files are sets of records ordered according to a readily recognizable ordering principle [e.g., alphabetical order, chronological date, geographic continent/country relation, biological phylum/species relationship, etc.], and lists are sets of records ordered in the same manner as [an] author's idiosyncratic ordering of the contents of a book.

The best example of an author's "idiosyncratic ordering" of material would be, exactly, the *table of contents* of his or her book, which is likely to show an arrangement or conceptual structure other than that of an alphabetical, ordinal, geographic, or other immediately-recognizable sequence (as in a "file"). If the actual book itself, however—i.e., the *content* of the book that follows the *table of contents*—is primarily composed of discrete informational units or entries that "can stand alone" (i.e., rather than being integrated in continuous expository or narrative text), and if these discrete units could have been "arranged in different orders with respect to each other without harming their meaning or use," then such an idiosyncratic order is designated a "list" rather than a "file." "Reference books," again, are defined as those having 60% or more of their pages made up of files or lists. Thus not all genre or form designations (e.g., "case studies," correspondence, "diaries," "personal narratives") are *reference* genres.

Bates's theoretical distinctions were backed by an empirical study of the characteristics of actual books in the reference collections of three libraries, in comparison to the "stacks" books of the same libraries. Nearly 90% of the volumes designated "reference" books did indeed have "60% or more of their pages made up of files or lists." One notable exception was discovered: "canonical texts" are frequently included in reference collections although they are not made up primarily of files or lists. Such texts are things like standard treatises on particular

subjects; compilations of laws and regulations; collections of standards and specifications; or literary, religious, and other authoritative texts (e.g., the *Bible*, the *Qu'ran*, or an indexed set of *Great Books*).

The primary virtue of having form and genre designations, in addition to subject groupings of material, to work with is that these categorizations greatly facilitate research for certain kinds of information *within* any subject area. The fact that the reference literature of any topic can be expected to fall into bibliographies, chronologies, dictionaries, directories, encyclopedias, and so on, provides a predictability factor to research that enables immediate attention to be directed toward some sources rather than others. Without the existence of predictable *formats* of literature being available, much time would be wasted—i.e., some questions are immediately answerable by directories, whereas regular monographs or dictionaries or chronologies within the same subject area would be irrelevant; others are best answered by encyclopedias, where monographic or atlas-format sources would only get in the way if they showed up in the same retrievals.

If one has a foreknowledge of the existence, as well as of the range and functions of the different reference formats available within *any* subject area, one can immediately think in terms of those categories, and thereby channel one's search efforts right from the start to only those resources whose format characteristics are appropriate to the question, while bypassing the others. For example, if one wishes to get brief overview knowledge of the Muslim historian Ibn Khaldun—his dates, his most important writings, his key ideas, and so forth—without having to read through hundreds of full-length books on him, one's search time and effort will be greatly reduced if one knows enough to anticipate the likely existence of an “encyclopedia” format reference source within the field of Islamic studies. In this case, the *Encyclopedia of Islam* (E.J. Brill, 1960–2002) provides a seven-page article that provides just the overview desired. Similarly, a researcher looking for an overview of the extensive literature on the British essayists Addison and Steele would be well served by first looking for a “bibliography” on the topic, such as Charles A. Knight's *Joseph Addison and Richard Steele: A Reference Guide, 1730–1991* (Prentice Hall, 1994), a 561-page annotated listing of 2006 directly relevant books, editions, articles, and doctoral dissertations—*none* of which have “the right keywords in the wrong contexts,” the bane of Internet type searches. The important point here is that searchers who can frame their questions in terms of predictably existing *reference formats* may, even without having any prior *subject* knowledge of the field in question, be much more efficient in finding desired information about a topic, without any wasted effort, than even full professors who have subject expertise but who lack an understanding of the predictability of various formats.

The same predictability of genre formats facilitates not just research itself but also the teaching of how to do it. Many courses in library research methodology use texts that are themselves structured by formats or types of literature. Such texts may seek to provide the means of searching, via reference formats, within all subjects across the board^[3]; or they may confine themselves to research within a specific discipline. An example of the latter is C. D. Hurt's *Information Sources in Science and Technology*^[4]; the first three sections of its contents are structured as follows:

MULTIDISCIPLINARY SOURCES OF INFORMATIONS

1. Multidisciplinary sources of information
 - Guides to the literature
 - Bibliographies
 - Abstracts and indexes
 - Encyclopedias
 - Dictionaries
 - Handbooks
 - Serials
 - Directories
 - Biographical directories
 - Theses and dissertations
 - Meetings
 - Translations
 - Copyrights and patents
 - Government documents and technical reports
 - Internet guides
 - Web sites

THE BIOLOGICAL SCIENCES

2. Biology
 - History
 - Guides to the literature
 - Abstracts and indexes
 - Encyclopedias
 - Dictionaries
 - Handbooks
 - Treatises
 - Directories
 - Web sites
3. Botany
 - Guides to the literature
 - Bibliographies
 - Abstracts and indexes
 - Encyclopedias
 - Dictionaries
 - Handbooks
 - Directories
 - Web sites

Essentially, the same few format breakdowns are used in 21 different subject areas (zoology, astronomy, chemistry, environmental sciences, general engineering, civil engineering, health sciences, etc.) It is, again, *predictable* that such reference genres can be found within *any* subject. While no one can remember the 1542 individual sources described in Hurt's book, anyone with a bit of training can remember the much smaller number of *types* of literature that can be expected to exist, no matter what subject is being researched. The predictability of this format structure within any topic area, once more, allows many inquiries to be much more immediately focused, with fewer wasted steps, and accomplished without the searcher having to wade through massive retrievals of term-weighted irrelevancies. (The phrase "relevance ranking"—*term weighting* is more accurate—is misleading in more ways than one. Not only does such algorithmic weighting fail to bring about the conceptual categorization of relevant sources, no matter what keywords [or languages] the sources themselves use; it also fails to bring about format categorizations that allow immediate focus to one's search efforts.)

One drawback in reliance on reference-format materials to pursue inquiries should be noted: a foreknowledge of the various types of literature enables a researcher to zero in quickly on reference sources relevant to a topic—i.e., those made up essentially of 60% or more of files or lists—but it does not enable the searcher to see "regular" books that are written in connected narrative or expository form. In terms of the distinction made earlier, not all primary literature or secondary literature is adequately covered by the tertiary literature of reference works. Direct access to the former levels, unconstrained and unchanneled by access through listings in reference sources, is still imperative. To gain this direct access (at least in research libraries in the English-speaking world) one must also know how to use the *Library of Congress Subject Headings (LCSH)* system within the library's general catalog; and one must also be aware of the trade-offs between searching via standardized conceptual and format categories (determined by *LCSH* terms) versus searching by keywords, no matter how the words are term-weighted by computer algorithms. Research instruction classes, in other words, need to cover more ground than a survey of reference-types of literature alone; they must also cover additional methods of searching (e.g., via controlled vocabularies [such as *LCSH*], via keywords, via citation links [showing which articles cite a known source], via related record links [showing which articles have footnotes in common with a known source], via bookstacks-browsing [exploiting LC or Dewey classification shelving arrangements], etc.). The predictable availability of this larger array of search methods (for gaining access to primary and secondary literature) is just as useful in focusing some searches as is the predictable availability of certain

reference formats (for gaining access to tertiary literature) in focusing other inquiries.^[5]

Form and genre designations are primarily useful within library catalogs or subject bibliographies, as mechanisms for *subdividing* larger categories of items that are themselves created on the basis of subject similarities. (Again, the subject "Afghanistan" is subdivided by the formats "bibliography," "encyclopedias," "gazetteers," etc.). To a lesser extent, format considerations also play a role in library classification schemes, in determining how physical book volumes may be shelved in relation to each other. The Library of Congress Classification (LCC) scheme, for example, is primarily structured according to subject categorizations (e.g., Class E books for American History, Class L for education, R for medicine, etc.). These groupings are further subdivided primarily by other subject considerations—but also, in some cases, by considerations of literature formats. A structured order of these subgroupings was largely standardized by Charles Martel, one of the architects of the LCC system in the early years of the twentieth century. As Immroth^[6] has noted, "The order of entries or foci within a class or subclass or individual subject is another unifying feature of LC classification. This order is called the General Principle of Arrangement within the Classes or 'Martel's Seven Points' as Martel is said to have instructed the subject specialists to follow this order as appropriate in the development of any section of the classification." That order is as follows:

1. General form divisions
 - Periodicals
 - Societies
 - Collections
 - Dictionaries
 - Encyclopedias
 - Congresses
 - Exhibitions
 - Museums
 - Yearbooks
 - Documents
 - Directories
2. Theory, philosophy
3. History
4. Treatises, general works
5. Law, regulation, state relations
6. Study and teaching
7. Special subjects and subdivisions

As Immroth further notes, "Usually the general form divisions that are applied [within any subject class] precede any other divisions. There is no absolute internal order for the general form divisions."

An example of the form subdivisions within Martel's structure may be found within the N (Visual Arts) class in the current LCC schedule:

N	(Visual arts)
N1–N8.Z	Periodicals
N9.A1–N9.9.Z	Yearbooks
N10–N17.Z	Societies
N21	Congresses
N25–N27	Collected writings (serial)
N31	Encyclopedias
N33	Dictionaries
N34	Terminology
N40–N44.Z	Biography
N45	Artists's marks and monograms
N50–N55.Z	Directories

The clustering of distinctive formats at the beginning of a class arrangement may be found in the Dewey Decimal Classification (DDC) system as well as in LCC. In Dewey, several form subdivisions are indicated by standard numerical designations that subdivide many different subject-classes at the same numerical position within each. Thus the 100s group in DDC (i.e., classes 100 through 199), representing the subjects “philosophy, parapsychology and occultism, psychology,” has several form clusters at its start:

103	Dictionaries, encyclopedias, concordances of philosophy
105	Serial publications of philosophy
106	Organizations and management of philosophy (roughly corresponding to “societies” in Martel’s Seven Points within LCC)

The designations -03 for dictionaries, -05 for serial publications, and -06 for organizations show up in the same positions within other topical classes, for example, 403 for dictionaries, 405 for serial publications, and 406 for organizations within the overall 400s (language) class.

The clustering of forms—particularly reference forms—at the beginning of any new class area, in either LCC or DDC, facilitates reference work for those who know what to look for. To begin with, the appearance of long runs of volumes of the same height, and having uniform bindings, immediately signals the presence of serial publications within a library’s book stacks. Since “periodicals” (LCC) or “serial publications” (DDC) always appear at the beginning of any new subject-class area, such visual markers indicate transitions on the bookshelves from one major subject-category to the next. But then, because of Martel’s Seven Points, a stacks-browser in an LCC library who notices a clustering of uniform serial volumes will also be able to predict that reference formats such as yearbooks, encyclopedias, dictionaries, and directories will follow the bound journals in reasonably close proximity. In a DDC library, the browser who spots the serial runs will similarly be able to predict that dictionaries, encyclopedias, and

concordances will immediately precede the cluster of journal volumes. The classes in both systems were designed by practicing librarians who, more than a century ago, did not have the array of databases and full text electronic sources that we take for granted today; for them, the arrangement of the books themselves, in the stacks, was structured to enable reasonably efficient access even in the absence of a card (or other) catalog of the collection. Even today, the structure of that arrangement retains a practical utility for reference work that cannot be matched by any system of mere “mark it and park it” inventory control shelving, in which neither subject nor format relationships of volumes determine the order of their arrangement.

Format considerations also show up the LCC in other significant ways, beyond Martel’s use of them as structuring elements within individual classes. Specifically, large parts of two entire classes (A and Z) are mainly composed of nothing but reference format material. Class A (General Works), right at the start of the entire LCC sequence, brings about some very useful groupings of reference genres. “General,” here, means “not discipline-specific”; for example, the *Encyclopaedia Britannica* seeks to cover all areas of knowledge; and a standard index to journals, *Readers’ Guide to Periodical Literature*, similarly covers articles in all subject areas. The various subdivisions of Class A deliberately bring together such “initial overview” sources:

AE	Encyclopedias For example: <i>Encyclopaedia Britannica</i> [AE5], <i>La Grande Encyclopedie</i> [AE25], <i>Brockhaus Enzyklopadie</i> [AE27], <i>Enciclopedia Universal Ilustrada</i> [AE61]
AG	Dictionaries and other general reference works For example: <i>The Columbia Encyclopedia</i> [AG5], <i>Famous First Facts</i> [AG5], <i>The New York Public Library Desk Reference</i> [AG6], <i>Guinness World Records</i> [AG243]
AI	Indexes For example: <i>Readers’ Guide to Periodical Literature</i> [AI3], <i>Essay and General Literature Index</i> [AI3], <i>Poole’s Index to Periodical Literature</i> [AI3], <i>New York Times Index</i> [AI21]
AP	Periodicals (general or multi-topical, not discipline-specific)
AS	Academies and learned societies For example: <i>Gale Directory of Learning Worldwide</i> [AS2], <i>The Europa World of Learning</i> [AS2], <i>Encyclopedia of Associations</i> [AS22], <i>The Foundation Directory</i> [AS911]
AY	Yearbooks, almanacs, directories For example: <i>World Almanac</i> [AY67], <i>Whitacker’s Almanack</i> [AY754]

One of the overall purposes of Class A as a whole is thus to serve as a kind of “table of contents” to all of the other classes (B through Z1199). Works shelved here tend to provide introductory-level information—wide in scope

but not very deep in coverage, providing a kind of overview mapping of the terrain that will be covered in greater depth, in its various parts, within each of the following classes. Thus the general encyclopedias in Class AE provide articles that are very brief (compared to full books) in all subject areas; and their articles also usually have concise bibliographies of the most important “starting place” sources for further reading (rather than exhaustive listings of all relevant sources). In a similar way, the periodical indexes in Class AI provide access to general magazines and newspapers; the articles contained therein may be on any topic, but they do not match the depth of subject penetration provided by whole books and specialized journals, which will be shelved in the subsequent classes starting with B. Class A, then, is a mixture of categorizations created by both “general” subject and reference-format characteristics, but it is especially laden with the latter.

The DDC has somewhat analogous clusters of general encyclopedia-format material near its beginning, in Class 000 (computer science, information, general works): Class 030 consists of “general encyclopedic works.” Bringing all of the general encyclopedias to the front of the entire scheme here, too, provides a kind of introductory overview mapping of subjects that are covered in much greater detail within the whole books and specialized journals shelved in the subject categorizations to follow (100 through 999).

Whereas Class A in the LCC system serves as the “table of contents” to the classes which follow, Class Z at the very end serves much like the “index volume” at the end of a large encyclopedia. The Z (bibliography and library science) grouping has two major parts: Z4 through the Z1100s are classes mainly composed of monographs and serials about books, publishing, and library science as subjects in themselves; the Z1200s and above are clusters of actual reference-format bibliographies covering *all* subject areas (i.e., not limited to bibliographies about books, publishing, and libraries).

The noteworthy point is that these subject bibliographies (covering particular subjects or geographic regions *as* subjects, in depth) are not shelved with the regular books on their corresponding topics. For example, regular monographs on Indians of North America tend to be classed in E51–E59 (pre-Columbian America and Indians of North America), but bibliographies on the same subject are classed in Z1209–Z1210. Similarly, monographs on President Millard Fillmore tend to be classed in E426–E430 (United States—Revolution to the Civil War); but bibliographies on him are in Z8295.9.

As mentioned earlier, in most instances in either the *LCSH* system (in the library catalog) or the LCC system (in the bookstacks), format considerations are used to subdivide subject groupings, rather than vice versa. The subdivisions of the “index volume” bibliographies at the end of Class Z, however, are an exception. The material

in this range is all of a particular reference format—bibliographies—to begin with; the arrangement of the bibliographies’ sequence is then subdivided by topical considerations, in three large clusters:

Z1201–Z4890 Geographically localized subject bibliographies (by continent, country, state, county, etc.) arranged in the order of North America, South America, Europe, Asia, Africa, Australia, and Oceania, with narrower localized subdivisions within each continent.

For example:

North America	Z1201–
The United States	Z1201–1363
Alaska	Z1255–1256
Arizona	Z1257–1258
Canada	Z1365–1401
Mexico	Z1411–1431
Central America	Z1437–
Belize	Z1441–1449
Costa Rica	Z1451–1459
South America	Z1601–

Z5000–Z7999 Subject bibliographies (usually lacking geographical limitations or focus, arranged alphabetically by subject).

For example:

Agriculture	Z5071–5076
Anthropology	Z5111–5119
Astronomy	Z5151–5156
Bees and bee culture	Z5256
Biology	Z5319–5323

Z8000–Z8999 Personal bibliographies (on individual people, usually literary authors or historical figures), arranged alphabetically by the surname of the subject.

For example:

Adams, Henry	Z8015.3
Austen, Jane	Z8048
Burton, Sir R.F.	Z8136.2
Chesterton, G.K.	Z8166.5

The use of simple and easily remembered ordering mechanisms (continent/country, alphabet) for these unusually important reference-format materials once again enables stacks-browsers to recognize where they are in relation to the whole scheme, even in the absence of a separate catalog of the collection. The class scheme thus increases the predictability of finding bibliographies on any topic—i.e., even if one does not know in advance that a bibliography actually exists on a particular subject, the arrangement of the Z classes gives an informed searcher a foreknowledge of which niches within the overall system are likely to contain such works, since the existence of the geographical and alphabetical niches is itself predictable, even if their specific contents are not.

The clustering together of all subject bibliographies, on all topics, at the very end of the LCC scheme also enables them to be browsed in relation to each other, as reference sources, without the cluttering presence of millions of non-reference works on the same subjects. This gives the bibliographies a cumulative utility that would be dissipated if each one were shelved with the monographs on its topic, in the regular B through Z1100s subject classes. (For example, the ability to see whole shelves of hundreds of subject bibliographies on women's studies, in Z7961 through Z7965, gives searchers in this subject area the capability of seeing relationships, and paths of access into the relevant literature, that could not otherwise be noticed.) The aggregation of reference sources at the end of the LCC scheme, again, enables them to serve as a kind of "index" to material to be found in all of the other classes. Whereas Class A provides relatively superficial "overview" access to all subjects, Class Z provides corresponding in-depth access to each of them. These functions are brought about primarily by the respective clustering of different *reference formats*, in strategic beginning and ending positions in the overall LCC sequence, which placements serve the different purposes.

The DDC system has a class analogous to LCC's Z1200–Z8999 for grouping together all subject bibliographies; but Dewey puts its "index volume" class at the beginning of its sequence, in Class 016 (Bibliographies and catalogs of works on specific subjects or in specific disciplines) within the 000s, rather than at the end, in the 900s.

Libraries must collect or provide access not just to conventional monographic books, but to other kinds of knowledge records as well. Journals, periodicals, and magazines have always been sought for research collections; but, as a rule, their individual articles are not indexed within a library's own catalog. Further, although journals do receive classification numbers in both LCC and DDC systems, the shelving of all volumes of the same journal in one location does little to indicate to a shelf-browser the particular subject content of any particular article(s) contained within the extensive runs of issues. Thus, neither the designations of reference formats in

the library's catalog through form subdivisions of LCSH headings (e.g., Philosophy—encyclopedias, France—history—chronology), nor the classification schemes' various clusterings of reference formats (i.e., via Martel's arrangements within classes, or via the A and Z groupings) reveal the content of individual journal articles in the way that the catalog and the class scheme reveal *books'* content. The various printed indexes themselves are indeed clustered intelligibly within the A and Z classes in LCC (or 016 in DDC); but this placement also separates the indexes from physical (and browsable) proximity to the hundreds of journals, shelved throughout the entire classification scheme, whose contents they index.

Although libraries catalog and classify the indexes that provide access to individual journal articles, they do not usually create such indexes to begin with; with the exception of some few special libraries' catalogs that do cover articles,^[7] this matter has largely been left to commercial publishers. Of course computerized versions of such indexes are the norm today; and many databases now provide full text access to journals, too; but these databases as well are generally created by commercial services rather than by libraries themselves. (Research libraries, all with chronic budget limitations, have always found it less expensive to subscribe to the indexing work done by private industry than to duplicate such costly labor on their own.)

But here, too, format and genre designations come into play, in ways analogous to their functions in the realm of book collections—i.e., journal articles, like books, may often be indexed not just according to their subjects, but also according to their various formats. And some of these journal formats are unusually important as reference genres. For example, the commercially-produced database *RILM Abstracts of Music Literature*, from the National Information Service Corporation, is not simply a subject index to thousands of journals (also books, conference papers, dissertations, etc.); it also enables users to search or limit by formats and genres. Specifically, it provides a search box allowing access by "publication type," including all of the following:

All

- Article in a collection of essays
- Article in a dictionary of a related discipline
- Article in a newspaper
- Article in a periodical or yearbook
- Article in a symposium proceedings or Congress report
- Article in a volume of essays printed as a Festschrift
- Article in translation
- Book division or chapter
- Book in facsimile or reprint form
- Book in translation
- Book of collected essays, letters, or documents
- Book of essays printed as a Festschrift

Book of symposium proceedings or a Congress report
 Book, monograph, or pamphlet
 Book: periodical as a whole
 Commentary accompanying a recording
 Commentary printed in the program of a concert or opera
 Commentary printed within an edition of music
 Commentary, printed separately, on an edition of music
 Dissertation, doctoral
 Dissertation, master's or other non-doctoral thesis
 Electronic resource
 Motion picture
 Music recording, sound recording
 Review of a book, monograph, or pamphlet
 Review of a dissertation
 Review of a facsimile or reprint edition
 Review of a new edition or music other than scholarly
 Review of a periodical or yearbook
 Review of a recording or film
 Review of a scholarly edition of music
 Review of a symposium proceedings or Congress report
 Review of a translation
 Review of a volume of collected essays
 Review of a volume of essays printed as a *Festschrift*
 Review of an article
 Review of an opera or concert
 Review of electronic resource
 Review of motion picture (video)
 Technical drawing of a musical instrument

Similarly, the *ISI Web of Science* database, from the Institute for Scientific Information (a subsidiary of The Thomson Corporation) is an index to 9000 scholarly journals in all subject fields (including social sciences and humanities, not just sciences); and it allows searches to be limited to a variety of "document types":

All document types
 Article
 Abstract of published item
 Art exhibit review
 Bibliography
 Biographical item
 Book review
 Chronology
 Correction
 Correction, addition
 Dance performance review
 Database review
 Discussion
 Editorial material
 Excerpt
 Fiction, creative prose
 Film review
 Hardware review
 Item about an individual
 Letter

Meeting abstract
 Meeting summary
 Music performance review
 Music score
 Music score review
 News item
 Note
 Poetry
 Record review
 Reprint
 Review (i.e., literature survey articles)
 Script
 Software review
 TV review, radio review, video
 Theater review

Many other commercial databases offer such "publication type" or "document types" search features. Several of these literature types—especially "reviews" of various sorts—are unusually important for reference work. Reviews are not easy to find within books; but such format-search capabilities in journal databases make them quite easy to zero in on, without burying them within much larger keyword retrievals—and it is within journals that most reviews appear in any event. As with the reference formats distinguished within book collections, such types of literature here, too, are not dependent on particular *subjects* (although there are sometimes *scope ranges* involved, as with the various formats connected to music—i.e., document types such as "dance performance review" or "music score review" will obviously not be found within journals devoted to subjects such as linguistics or nursing). The fact that most of these nonbook reference formats will predictably appear within multiple journals, usually regardless of the overall subject area of the journals, similarly enables many searches to be done much more efficiently, quickly, and precisely, than they could be if only subject (or keyword) searching were possible.

The predictability of reference formats, and their use in narrowing and focusing searches that would otherwise result in information overload, is, on the whole, still lacking in Internet search environments. Although it is now possible to limit Net searches to some large format-segments of sites—e.g., blogs, images, games, maps, news stories, patents, videos—the range of such types of sites is noticeably limited compared to the wider variety and greater specificity of format options available within library catalogs and commercially produced index databases. A major reason for the difference lies in most search engines' reliance primarily on automated computer algorithms to bring about the sorting of retrieved results; and term-weighting of keywords, designed mainly to cut down the clutter of sites irrelevant by subject, is not adequate either to make important distinctions among, or to clearly segregate, formats of records. Cataloging or indexing according to document types, especially the subset

of types that are reference formats, has up to now been successfully accomplished only by human beings. Whether it can be accomplished in the future by machine algorithms is a question not yet answered.

In any event, whether human-created or machine-generated, reference form and genre designations play an increasingly important role in research today: the greater the size of any subject retrieval, the more necessary are filtering mechanisms that sort, categorize, and subdivide the results in ways that prevent information overload and allow searches to be efficiently focused on only the most appropriate sources. In addressing this need, form categorizations are equally as important as subject groupings.

Reference and User Services Association (RUSA)

Barbara A. Macikas

American Library Association, Chicago, Illinois, U.S.A.

Abstract

The Reference and User Services Association (RUSA), a division of the American Library Association (ALA), has the following mission: RUSA is responsible for stimulating and supporting in every type of library the delivery of reference/information services to all groups, regardless of age, and of general library services and materials to adults.

INTRODUCTION

The Reference and User Services Association (RUSA), a division of the American Library Association (ALA), has the following mission: RUSA is responsible for stimulating and supporting in every type of library the delivery of reference/information services to all groups, regardless of age, and of general library services and materials to adults. At the 2000 ALA midwinter meeting, the RUSA Board of Directors adopted the following vision statement: The RUSA is the foremost organization of reference and information professionals who make the connections between people and the information sources and services they need.

Also at the 2000 ALA midwinter meeting, the RUSA Board of Directors adopted the following statement of values:

- We believe in universal access to information in a wide variety of formats.
- We value collections and information sources of the highest possible quality.
- We believe in reading as fundamental to quality of life and value all activities that promote it.
- We value the provision of innovative services and programs that meet the changing information needs of diverse populations.
- We value continuous evaluation and improvement in the management and delivery of collections and services to users.
- We value the professional growth and development of reference and user services staff.
- We value the role of reference and user services staff as educators in creating lifelong learners and critical thinkers.
- We value the unique contributions that human beings bring to the process of connecting users with the information they need.

MEMBERSHIP

The RUSA has a membership of over 5000, including both personal and organizational members. Personal members of RUSA work in all types of libraries and the publishing and information industry. Past studies of the membership have shown that about one-half of the membership works in academic libraries, one-fourth in public libraries, and the remainder in school libraries, networks, library education, and publishing. Members of RUSA are reference librarians, bibliographers, administrators, adult services librarians, collection development specialists, readers' advisers, public service librarians, and individuals working in the publishing and information industry.

NAME CHANGE

The RUSA was previously named the Reference and Adult Services Division (RASD). The RASD was formed in 1972 when two ALA divisions, which had been created in 1957, merged—the Reference Services Division (RSD) and the Adult Services Division (ASD). In 1995, the RASD Board of Directors considered changing the name of the organization. During their deliberations, they indicated their interest in including the word “association” in the name to clearly indicate that the organization was an association in its own right in addition to being one of the component parts of the ALA. By this time all of the other ALA divisions had already changed the word “division” in their names to “association.” The Board of Directors was also concerned that the name “Reference and Adult Services Division” did not adequately reflect the mission of the organization, since the name did not mention reference services to children. Lastly, the board also wanted a name with a pronounceable acronym. After it was approved by the membership in the spring of 1996, the change from RASD to RUSA took effect in September 1996.

ORGANIZATION

The RUSA is organized into six membership sections: Business Reference and Services Section (BRASS), Collection Development and Evaluation Section (CODES), History Section (HS), Machine-Assisted Reference Section (MARS), Reference Services Section (RSS), and Sharing and Transforming Access to Resources (STARS). Each section offers members committee and discussion group opportunities. The BRASS has committees on business reference in academic and public libraries, as well as a committee that reviews business reference sources. The CODES sponsors the Notable Books Council, a group that selects the best fiction, poetry and nonfiction for adults, as well as committees on readers' advisory, collection development and evaluation, and a committee that selects the year's best reference sources. In 2007, CODES created a genre fiction booklist award, the Reading List. The Reading List Council highlights outstanding genre fiction in eight categories including: Adrenaline titles (suspense, thrillers, and action adventure); Fantasy; Historical Fiction; Horror; Mystery; Romance; Science Fiction and Women's Fiction. The History Section sponsors groups that focus on genealogical research, historical events and historical bibliographies. The MARS has committees on management of electronic services, local systems and services, and user access to services. The RSS represents all aspects of reference and information services including delivery, management, and evaluation, with committees focusing on services to specific populations such as the aging, Spanish-speaking, and adults, as well as those concerned with research, marketing and information literacy. The STARS focuses on interlibrary loan, document delivery, remote circulation, access services, cooperative reference, cooperative collection development, remote storage, and other shared library services.

PUBLICATIONS

The RUSA publishes *Reference and User Services Quarterly (RUSQ)*, a scholarly journal with referred articles, regular columns and reviews of reference sources, professional materials, and electronic resources. Previously named *RQ*, the journal's name change took effect with Volume 37, Number 1 in 1997. The association also publishes *RUSA Update*, a quarterly electronic newsletter containing news of division activities. In addition to these periodical publications, the association publishes monographs and an occasional paper series. Recent titles include *Key Business Sources of the U.S. Government*; *Adult Programming: A Manual for Libraries*; *Towards a New Vision of Reference: Kaleidoscopic Collections and Real Librarians*; and *Collection Evaluation Techniques: A Short, Selective, Practical, Current Annotated Bibliography*.

AWARDS

The RUSA has an active award program to recognize outstanding achievement by members of the library profession. The division sponsors the following awards:

- Isadore Gilbert Mudge—Gale Cengage Learning Award (established 1958): \$5000 and a citation to an individual who has made a distinguished contribution to reference librarianship.
- Dartmouth Medal (established 1974): A medal and honorable mention certificate that honors the creation of reference works of outstanding quality and significance.
- John Sessions Memorial Award (established 1980): A plaque given to a library or library system to honor significant work with the labor community and to recognize the history and contributions of the labor movement toward the development of this country.
- Margaret E. Monroe Library Adult Services Award (established 1985): A citation to honor a librarian who has made significant contributions to library adult services.
- Reference Service Press Award (established 1985): \$2500 and a plaque presented to recognize the most outstanding article published in *RUSQ* during the preceding two-volume year.
- Gale Cengage Learning Award for Excellence in Business Librarianship (established 1989): \$3000 and a citation to an individual who has made a significant contribution to business librarianship.
- Gale Cengage Learning Award For Excellence in Reference and Adult Library Services (established 1990): \$3000 and a citation to a library or library system for development of an imaginative and unique resource to meet patron's reference needs.
- Louis Shores—Greenwood Publishing Group Award (established 1990): \$3000 and a citation to an individual reviewer, group, editor, review medium or organization to recognize excellence in book reviewing and other media for libraries.
- BRASS/Gale Cengage Learning Student Travel Award (established 1992): \$1000 award given to a student enrolled in an ALA accredited master's degree program to attend the ALA Annual Conference.
- Genealogical Publishing Company Award (established 1992): \$1500 and a citation awarded to a librarian, library, or publisher to encourage professional achievement in historical reference and research librarianship.
- Virginia Boucher—OCLC Distinguished ILL Librarian Award (established 1999): \$2000 and a citation recognizing a librarian for outstanding professional achievement, leadership, and contributions to interlibrary loan and document delivery.

- Dun & Bradstreet Public Librarian Support Award (established 1999): A citation and \$1000 to support the attendance at the annual conference for a public librarian who has performed outstanding business reference service and who requires financial assistance to attend the ALA annual conference.
- Dun & Bradstreet Award for Outstanding Service to Minority Business Communities (established 1999): \$2000 and a citation that recognizes one librarian who, or library that has created an innovative service for a minority business community, or has been recognized by that community as an outstanding service provider.
- ABC-CLIO Online History Award (established 2005): Every other year beginning in 2005, \$3000 and a citation recognizing a person or a group of people producing a freely available online historical collection, or an online tool tailored for the purpose of finding historical materials, or an online teaching aid stimulating creative historical scholarship.
- Emerald Research Grant Award (established 2006): \$5000 and a citation to individuals seeking support to conduct research in business librarianship.
- STARS-Atlas Systems Mentoring Award (established 2006): \$1000 to a library practitioner who is new to the field of interlibrary loan/document delivery or electronic reserves, for travel, registration, and membership at ALA Annual Conference.

CONTINUING EDUCATION OPPORTUNITIES

The RUSA offers its members many continuing education opportunities. At each ALA annual conference, the division sponsors programs on a broad range of topics such as readers' advisory services, best practices in reference and user services, collection development, the use of electronic journals, and the dynamics of print vs. online reference sources. Before the ALA annual conferences, the division also offers full-day workshops on topics such as business reference, emerging electronic reference sources, genealogical research, and resource sharing. RUSA also offers a variety of online electronic courses on topics including the reference interview, reader's advisory and genealogy.

GUIDELINES

The association establishes guidelines to serve as authoritative documents offering suggested levels of performance for the profession. Guidelines in the following categories have been established:

Electronic Services

- Guidelines for Implementing and Maintain Virtual Reference Services, 2004.
- Guidelines for the Introduction of Electronic Information Resources to Users, 2006.

Genealogy, History

- Guidelines for Developing Beginning Genealogical Collections and Services, 1999.
- Guidelines for a Unit or Course of Instruction in Genealogical Research at Schools of Library and Information Science, 1996.
- Guidelines for Establishing Local History Collections (2006).

Interlibrary Loan

PROBLEMS AND ISSUES

Concerns of RUSA members mirror those of many of the ALA's other divisions: recruitment, professional development, and library school education. But RUSA members are also concerned about issues focused on reference librarianship, particularly the development of reference services in a digital age, and the diminishing value that

information seekers place on more traditional library reference services.

To respond to these concerns, RUSA's strategic focus is on the future of reference and users services, with a goal to recast the provision of reference service to meet the needs of twenty-first century users. In particular this means positioning reference librarians to serve as consultants to help patrons evaluate and select quality information amid a rising sea of information presented in ever increasing formats and technologies and encouraging reference librarians to more than ever serve as resources and teachers of new technologies, information and research skills to increasingly diverse populations with a wide range of needs and skill levels.

Another challenge facing RUSA membership is that while demand for electronic resources and collections continues to grow, concerns persist about costs, coverage, availability, and access. Reference librarians constantly strive to provide accurate and current information to their users, but are often stymied when database coverage changes or license changes curtail access. Future access to database information could also be in jeopardy as database companies change ownership or discontinue a product.

Although many libraries have reported a decline in the number of reference transactions, the length of the

reference encounter seems to be on the rise. The decline has been attributed to more people using the Internet to find the information they need. The reason for the longer encounter time is also the Internet. Reference librarians are increasing the amount of time they are taking to teach patrons how to design effective search strategies and then evaluate the search results. Although some have predicted that Internet search engines will put reference librarians out of business in 10 years, reference librarians know this is unlikely. In fact, they believe that reference and user services will become the library's core service. The key to this, however, is how well we can reinvent our services to match the changing needs of our clients. The RUSA will be there to help reference librarians in this endeavor.

Reference Services

Linda C. Smith

School of Information Sciences, University of Illinois at Urbana-Champaign, Champaign, Illinois, U.S.A.

Abstract

This entry provides an overview of reference services and the impact of technology on reference sources and services. Following a brief overview of the history of reference services, the types and scope of reference services are explained. Features of the reference interview and factors contributing to its success are considered, followed by a discussion of the various types of reference sources and the development of reference collections. An outline of the impact of technology on new forms of service delivery includes an explanation of both asynchronous and synchronous approaches. The ways in which reference ethics and reference policies guide services are reviewed, and the role of evaluation in assessing effectiveness of reference services is explored. This entry concludes with indications of future trends in reference services.

INTRODUCTION

To mediate between a library user's information needs and the information resources accessible to that user through the library, libraries offer reference services. The provision of reference services in libraries dates from the late 1800s. As noted by Margaret Hutchins in 1944, "Reference work includes the direct, personal aid within a library to persons in search of information for whatever purpose, and also various library activities especially aimed at making information as easily available as possible."^[1] Reference services continue to exist in libraries because the many means of access to and use of information resources are not intuitively self-evident. Reference services may range from a minimal level of aid to users in locating their own information to the actual delivery of information to users. Librarians may also offer assistance to users in deciding which materials to read for pleasure or study.

Prior to initiating a search in response to a question, the reference librarian conducts a reference interview to develop a more complete understanding of the user's information need. Successful reference interactions require a variety of skills in addition to effective questioning. Librarians should have a genuine interest in users' information needs, an ability to establish trust and confidence, flexibility in developing search strategies, and knowledge of reference sources. Reference sources can be divided into two main classes: compilations that furnish information directly and compilations that refer to other sources by indicating places in which the information sought may be found. The work of reference librarians includes selection of an adequate and suitable collection of reference sources and arrangement and maintenance of the collection so that it can be used easily and conveniently.

Developments in telecommunications and computer technology have impacted both reference work and reference sources. Users need no longer come to the library to ask questions; instead they may use the telephone, e-mail, web forms, or instant messaging. Physical reference collections housed in reference rooms in libraries are now supplemented by licensed databases and freely available authoritative web resources.

In their work reference librarians are guided by ethical principles as expressed in professional codes of ethics and by their own library's reference policies. The continuing improvement of reference services depends on regular evaluation of service effectiveness.

HISTORY OF REFERENCE SERVICES

The generally recognized starting point for the history of reference services is the 1876 paper by Samuel Swett Green of the Worcester Public Library on *Personal Relations between Librarians and Readers*.^[2] Green identified four components of reference services: (1) instruct the reader on how to use the library and its resources; (2) answer readers' questions; (3) aid the reader in the selection of good works; and (4) promote the library within the community. The concept of reference services emerged in the United States in first public and then academic libraries as the result of a number of factors—increasing urbanization, growing immigrant populations, the rise of public education, and changing modes of instruction in American colleges and universities.^[3] In a growing number of libraries, this led to the designation of one or more library staff members to fill the reference function, the creation of reference rooms, and the establishment of distinct reference collections. Beginning in the early 1900s, the special

library movement in business, industry, government, and research settings placed an emphasis on more in-depth information services to the clientele of those organizations. To better prepare library staff for this emerging role, courses in reference work were introduced in library schools, and the first text, Alice Bertha Kroeger's *Guide to the Study and Use of Reference Books*,^[4] was published in 1902. Over the next century, reference services continued to develop as library collections grew and library organizations became more departmentalized. In larger libraries, specialization could occur by subject (e.g., business), clientele served (e.g., children), form of material (e.g., government documents), or function (e.g., interlibrary loan). Throughout the same period, developments in technology, from the telephone to the Internet, had a significant influence on the emergence of new approaches to reference services. The maturing of reference services as an area of specialization is also reflected in the establishment of the Reference Services Division within the American Library Association (ALA) in 1957. This became the Reference and Adult Services Division in 1972, renamed the Reference and User Services Association (RUSA) in 1996.^[5] An important function of RUSA is the development of guidelines for various aspects of professional practice.

Beginning in the 1970s, reference services transitioned from a period of certainty regarding roles, resources, and methods to a period of change and challenge,^[6] driven in large part by developments in computer and communications technology. In his 1984 article "What's wrong with reference," William Miller called for a reexamination and reorganization of reference services.^[7] This led to a period of "rethinking reference" that included exploring alternative staffing models, experimentation with newer technologies, and a focus on patron-centered service. Nevertheless, most libraries kept their reference desks as the focal point of reference services. The emergence of the World Wide Web and search engines resulted in a dramatic shift beginning in the 1990s. The proliferation of high-speed campus networks, broadband access from homes, and wireless access in public spaces highlighted the inadequacy of a building-centered model for delivery of reference services.

CHANGING CONTEXT FOR REFERENCE SERVICES

Trends in technology impact the extent to which the reference librarian is needed as an intermediary between the user and resources in digital form. Digital databases were initially accessible through telecommunications networks beginning in the 1970s. Reference librarians searched these resources on behalf of users because of the expertise required to search effectively and the cost associated with access. When databases on CD-ROM later became

available on computer workstations housed in the library, the era of "end-user searching" began.

With the emergence of the World Wide Web, it has become much easier for users to find information on their own. Mobile communication devices have led to the diffusion of access into a wide range of work, school, and leisure activities. In this information-rich world, information can be sought anytime, anywhere. Now users have alternatives that are more convenient than coming to a physical library at set hours to consult with a reference librarian. As a result, reference librarians have to find ways to respond to contemporary users' values and expectations of immediacy, interactivity, personalization, and mobility. If reference services are to be used, attention must be given to minimizing the time, the effort, and the difficulty of use.

While the intermediary role of the librarian may now sometimes involve doing some searching on behalf of the user, it is more likely to emphasize guidance in choosing among and using available resources, both print and digital. Reference librarians need to raise user awareness that the resources freely available through Internet search engines are only a portion of what could be helpful in meeting their information needs. Library print collections still contain centuries of accumulated knowledge not yet in digital form (although mass-digitization projects by organizations such as Google and the Open Content Alliance are shifting that balance) and libraries subscribe to databases because they provide information not available elsewhere. Because users can answer simple questions themselves, the types of question handled by reference librarians have become more complex.

Another trend to which reference librarians have to respond is the increasing diversity in populations served. Users of libraries in the United States today come from all over the world and speak many different languages. Library users can also vary in such dimensions as age (e.g., children, teens, adults, senior citizens) or disability (e.g., physical, mental). Success in providing reference service depends on flexibility, cultural competence, openness, and empathy toward the many diverse users.

SCOPE OF REFERENCE SERVICES

Definitions

The contemporary role of the reference librarian is reflected in two definitions approved in 2008 by RUSA:^[8]

Reference transactions are information consultations in which library staff recommend, interpret, evaluate, and/or use information resources to help others to meet particular information needs. Reference transactions do not include formal instruction or

exchanges that provide assistance with locations, schedules, equipment, supplies, or policy statements. *Reference work* includes reference transactions and other activities that involve the creation, management, and assessment of information or research resources, tools, and services.

In the second definition, creation and management of information resources includes the development and maintenance of resources that can be used independently, either in-house or remotely, to satisfy information needs. Assessment activities include the measurement and evaluation of reference resources and services. These definitions emphasize the informational dimension of reference work. In many libraries, reference services also include responsibilities for both instruction (formal or informal) and guidance (the readers' advisory role). The relative emphasis among information, instruction, and guidance depends on the library's mission and users' needs. While the definition of reference transaction excludes "exchanges that provide assistance with locations, schedules, equipment, supplies, or policy statements," users do need assistance in such activities as getting oriented to the library building, working with computers and printers, and understanding circulation policies. Either reference librarians also answer these questions or some type of tiered service is implemented, with reference assistants answering basic questions and referring more complex questions to the reference librarians.

Types of Reference Service

Some common types of reference service include readers' advisory, ready reference, research consulting, bibliographic verification and interlibrary loan, and instruction. Some reference librarians may be involved in all of these activities, while others may specialize in areas such as readers' advisory services or instruction. Marketing is needed so that users are made aware of the range of services available from the library.

Readers' advisory is the process of recommending sources to library users. A successful readers' advisory service is one in which knowledgeable staff help fiction and nonfiction readers with their leisure-reading needs. Readers' advisors see themselves as links between readers and books, just as reference librarians are the connections between users and informational materials.^[9]

Ready reference is the provision of short, factual answers to highly specific questions. A wide array of reference sources, such as directories, dictionaries, and encyclopedias, are useful in answering ready reference questions. In the past, reference librarians did more ready reference simply because the sources required to answer such questions were in library collections and not available to users. With the increasing volume of authoritative

content made accessible through a library's website or search engines such as Google, many users now have the tools to find this type of information on their own. As a result, there is less need to consult a librarian for ready reference. With the decline in ready reference has come an increase in emphasis on research consulting. In this case, the librarian may suggest sources, search terms, and strategies that will lead to material related to the user's information need.

Given the increasing volume and complexity of information sources in both print and digital form, reference librarians are often called on for bibliographic verification, determining full and accurate bibliographic information for a sought document and its location. If the document is not available as part of the library's collection or freely available on the web, then the librarian can assist the user in securing a copy through interlibrary loan.

Instruction can take two forms: direct and indirect. Direct instruction is characterized by the librarian communicating directly with the user. This may occur one-on-one with the librarian teaching the user as they work together to locate information or it may be done in a group environment in workshops or classes. Indirect instruction is provided in anticipation of user needs and involves development of instructional tools. These may include guides that describe how to use the catalog, a database, or a specific reference source. Other guides may focus on a specific discipline, highlighting relevant and authoritative print and digital sources.

While some users will discover the range of available reference services unaided, many will need to have the services promoted to them before they will be aware of what modern reference services have to offer. Marketing is the activity through which librarians develop the needed services, decide how to deliver the services, determine how best to communicate their value, and then promote the services relevant to each group of users. Reference librarians are often central to a library's marketing efforts.

Approaches to Reference Service

In the late nineteenth century, the reference desk was established as the central point of library services and patron interaction. For over a century, it remained largely unchallenged, but the reference desk is now just one of many avenues by which users can receive assistance. Any location in the library can be served by a roving reference librarian. The roving method is distinguished by the fact that the librarian is the one who initiates the reference transaction by approaching the potential user. Tiered service enables staff with varying levels of expertise to answer questions at different levels of difficulty. Paraprofessionals or student assistants staff an information desk and answer directional questions and basic ready reference or library holdings questions, freeing up reference librarians to answer more challenging research-level questions.

In contrast to these models that require that the user be physically in the library building in order to receive assistance, there is now increasing emphasis on serving users at a distance. This may involve “embedded” librarians, spending time where the users are, such as in a student union or academic department on a college campus. Alternatively virtual (also called digital or electronic) reference uses available technologies such as e-mail, instant messaging, or web-based forms to enable users at a distance to submit questions and receive responses from reference librarians. Technologies on the horizon for enhanced interactivity include Skype and videoconferencing.

The impact of technology on reference is best seen as a continuum rather than as primarily a phenomenon of the recent past. For several decades, many libraries have provided some question answering over the telephone. Increasingly, the attitude among reference librarians in all types of libraries is to support whatever means possible for responding to users’ information needs, within staffing and budgetary constraints. This can mean having a virtual presence where users are, whether in online courseware, social networking sites such as Facebook, or virtual worlds such as Second Life. E-mail, text chat or instant messaging, and web-based forms have come into wide use as a way for reference librarians and users to communicate.

REFERENCE INTERVIEW

Purpose of the Interview

A reference transaction is initiated by a reference interview. The user’s initial question often has to be clarified. The purpose of the interview is to elicit from the user sufficient information about the user’s information need to enable the librarian to understand it enough to begin searching. Some reference questions are straightforward and do not require a high degree of interaction between the reference librarian and the user to be successful. Others require a great deal of negotiation. Questioning during the reference interview may elicit information about what the user wants to know; how the user plans to use the information; what level of detail would be useful; what format of information is preferred; and any other restrictions, such as whether there are time limits or deadlines. After determining a more complete understanding of the information need, the librarian must match that need with the information sources available, whether in print or digital form.

Communication Techniques

The reference interview has been the subject of much research and analysis, demonstrating that the quality of the interaction that the user has with the librarian is

important to a successful outcome of the transaction. As a result, guidelines have been developed with the goal of enhancing communication effectiveness.^[10] These guidelines outline in a linear way the elements of best practice in reference interviewing, including visibility/approachability, interest, listening/inquiring, searching, and follow-up. These guidelines have been updated to encompass both face-to-face and remote encounters by telephone, e-mail, chat, and so on, where traditional visual and nonverbal cues do not exist. However, since the reference interview is a process, with steps repeated and returned to as necessary, the guidelines alone do not give a complete picture.

The questioning process seeks to: (1) elicit the user’s question in his or her own words; (2) make information available that the librarian needs to enable effective searching and accurate provision of information; and (3) verify that the librarian and user share the same understanding of the information need. There are several communication strategies that can be used during question negotiation, including the judicious use of open and closed questions. Open questions encourage users to talk about the information need using their own terms (e.g., We have a number of books/articles about [TOPIC]. Was there something in particular you were looking for?). Closed questions ask for a “yes” or “no” response or present the user with options from which to choose (e.g., Do you want advanced material or something basic?).

It is important not to start searching too early in the interview process. Once the search process has been started, the librarian can continue to ask questions, refining the search strategy accordingly. When providing information, it is important to cite the source and verify that the answer matches the scope of the user’s question and that the level or amount of information given is what was desired. The end of the reference interview should leave open the opportunity for the user to request further assistance if needed.

Increasingly, reference interviews are taking place virtually rather than face-to-face. The two basic modes of virtual service, asynchronous and synchronous, differ substantially in their immediacy and interactivity. Asynchronous services based on e-mail and web-based forms offer the advantage of a medium familiar to nearly all users of the Internet. Though it is possible to engage in a reference interview through a series of e-mail exchanges and clarifications, e-mail is best suited for straightforward questions. Some libraries attempt to overcome the limitations of unstructured and potentially incomplete e-mail questions by utilizing a web-based form in an effort to elicit enough information and context to provide a useful response. In contrast to the asynchronous communication mode of e-mail, synchronous reference service using the telephone and now chat or instant messaging has the potential to enhance communication effectiveness through real-time collaboration between the user and the librarian.

Librarians are justifiably concerned with the quality of the user's virtual experience when compared with face-to-face transactions. RUSA Guidelines for Implementing and Maintaining Virtual Reference Services provide librarians with things to consider as they prepare for and provide such services.^[11] Libraries are extending their participation in resource sharing to include sharing reference expertise as an extension of virtual reference services. For example, the QuestionPoint service of OCLC Online Computer Library Center (OCLC) provides libraries with access to a growing collaborative network of reference librarians in the United States and around the world.

REFERENCE SOURCES AND REFERENCE COLLECTIONS

Reference Sources

Reference librarians must be able to respond to a wide variety of questions, depending on the needs expressed by library users. Increasingly, the concept of a reference collection made up of reference books is an inadequate characterization of the resources most frequently used by reference librarians. Although print materials continue to be used, they are supplemented by authoritative digital resources. With the availability of a growing number of freely available resources on the web, it is limiting to think of the reference collection as only those materials that are purchased or licensed by the library. As more and more information has become available in digital form, libraries are finding that the use of print reference collections has decreased substantially.

It is possible to divide reference sources into two main classes: compilations that furnish information directly and compilations that refer to other sources containing information. In practice, this distinction becomes blurred because sources of the first type often refer to others for fuller information, and those of the second type are adequate for answering some questions. Sources of the first type include encyclopedias, dictionaries, almanacs, handbooks, yearbooks, biographical sources, directories, atlases, and gazetteers; sources of the second type include catalogs, bibliographies, and indexes.

While some indexes and abstracts have been available in digital form for nearly 50 years, the digital availability of other categories of reference sources, such as specialized subject encyclopedias and handbooks, is much more recent. The last decade has seen a rapid increase in the availability of reference titles in digital form, the aggregation of multiple titles into virtual reference collections, and the emergence of new forms of collection that go beyond a simple aggregation of the contents of individual print titles. An example of a resource that aggregates content from multiple publishers is Credo Reference. As of

2016, this web-based collection included hundreds of titles from more than 100 publishers.

This proliferation of digital products has allowed librarians to access content they may not have been able to collect in print, but there are potential drawbacks. Rather than having the flexibility to select individual reference volumes from many different publishers, librarians increasingly have to select one aggregated package over another. This can have the effect of increasing the range and depth of a reference collection while also decreasing the flexibility to customize the collection to reflect the interests of the library's specific user community. An additional concern is that digital content is often licensed rather than purchased, meaning that such titles are not permanently added to the collection.

Reference Collection Development and Maintenance

The work of reference librarians includes selection of an adequate and suitable collection of reference sources and arrangement and maintenance of the collection so that it can be used easily and conveniently. Increased costs of reference sources and proliferation of formats and titles have focused attention on the importance of a systematic approach to reference collection development. Decisions in collection development include whether to buy newly published titles, buy new editions of titles already in the collection, cancel a title that is now freely accessible on the web, continue serials such as indexes, or license access to a newly published web-based resource. A written collection development policy can provide guidance in making these decisions and will help in establishing and maintaining an effective reference collection.

Just as different libraries have somewhat different sets of titles making up their reference collections, there are different possible arrangements of titles. One possibility is to maintain a classified arrangement regardless of type. An alternative is to group types of sources together, creating sections for encyclopedias, biographical sources, directories, indexes, and so forth. Most collections designate a portion of the titles as ready reference, kept at or near the reference desk. With the increasing availability of resources in digital form, reference librarians are often involved in projects to design the interface or gateway to orient library users to available digital resources and aid in their selection. There must be a systematic basis for weeding and for adding new titles to the collection. A growing number of libraries are weeding and reducing the size of their print reference collections, reflecting the decreasing use of print resources as more materials become available in digital form.

In building the reference collection, the librarian must evaluate the quality of individual sources and their suitability for inclusion in the library's reference collection. Selection criteria can include format, content, authority,

and cost. Added considerations of digital resources include such factors as the user interface and possibilities for customization. The Internet has facilitated new forms of collaborative authorship that make it more difficult to judge the authority and accuracy of the resulting product. For example, Wikipedia is written and edited by numerous volunteers, who can continuously change and add articles.^[12] Reference librarians need to exercise the same type of selectivity that they do in building physical reference collections when developing virtual collections. The Library of Congress Virtual Reference Shelf^[13] is an example of a virtual reference collection. As the emphasis on building digital collections grows, guidelines are being developed to inform their design.^[14]

REFERENCE ETHICS AND EVALUATION OF SERVICES

Reference Ethics

Reference services are guided by both reference policies at the institutional level and the Code of Ethics of the American Library Association.^[15] The Code consists of eight principles. Those with particular relevance to reference services include Items I, II, III, IV, VII, and VIII.

Principle I expresses the responsibility for providing courteous, accurate, unbiased, and equitable service (drawing on a strong collection of resources): “We provide the highest level of service to all library users through appropriate and usefully organized resources; equitable service policies; equitable access; and accurate, unbiased, and courteous responses to all requests.” Principle VIII addresses the need for the reference librarian to stay up-to-date with the field and continually expand one’s knowledge: “We strive for excellence in the profession by maintaining and enhancing our own knowledge and skills. . . .”

Principle III speaks to the need to respect user privacy and confidentiality in the context of reference transactions: “We protect each library user’s right to privacy and confidentiality with respect to information sought or received and resources consulted, borrowed, acquired or transmitted.” Principles II and VII emphasize the need to uphold intellectual freedom in building strong, balanced reference collections and providing users the information they seek: “We uphold the principles of intellectual freedom and resist all efforts to censor library resources” and “We distinguish between our personal convictions and professional duties and do not allow our personal beliefs to interfere with . . . the provision of access to . . . information resources.” Finally, the provision of reference services needs to conform to authors’ and publishers’ intellectual property rights as outlined in Principle IV: “We respect intellectual property rights and advocate

balance between the interests of information users and rights holders.”

Expectations for reference librarians are further elaborated in the RUSA Professional Competencies for Reference and User Services Librarians that describe the activities of a reference librarian performing ethically.^[16] Reference librarians also need to be aware of necessary limits on question answering, especially as they relate to medical, legal, and business questions where librarians must be careful to be of assistance without offering advice.^[17]

Ethical issues such as confidentiality and privacy are also relevant in the digital environment, where it is possible to track a record of an individual’s questions. Such records should be treated with the same respect for confidentiality and privacy as library circulation records. There is also the ethical issue of availability of and access to digital reference services. If librarians devote more and more of their resources and time to digital reference, then service to those who do not have Internet access could be negatively affected.

Evaluation of Services

Principle I of the ALA Code of Ethics indicates that librarians should provide “the highest level of service to all library users.” In order to gauge the effectiveness of reference services, evaluations must be undertaken. At the individual level, evaluation can be continual self-assessment of the effectiveness of the reference interview and the quality of answers given. A more formal evaluation of reference services in a library can focus primarily on inputs to the reference process, such as assessing the quality of the reference collections, whether physical or virtual. Or evaluation can emphasize the process of the interaction between the librarian and the user. In a virtual reference transaction, this can include reviewing the text of e-mail exchanges or chat session transcripts. Finally, evaluation may focus primarily on the outputs or outcomes of the transaction—was the user satisfied with the process and/or the information received. Evaluation data can be gathered through surveys and questionnaires, observation, or focus groups and interviews. As libraries face increasing pressures to demonstrate value to their parent organizations, methods to determine return on investment in reference services need to be developed.^[18]

CONCLUSION

Reference services have changed considerably since Green first proposed the core concept. As Robert Kieft observes, “The service edifice built by reference librarians beginning in the late nineteenth century does not so much threaten to collapse as to be reborn in ways that we are still groping to discern.”^[19] Reference librarians are now

providing “personal assistance to readers” both within the library and far beyond library walls and embracing new technologies as they retain traditional values. Rapid changes in technology will likely continue and those changes will affect the ways in which users seek and manage information. Those changes in user behavior will, in turn, continue to challenge the ways that reference librarians offer their services. As the popular perception that “everything is on the web” grows, reference librarians must find ways to show which types of information resources answer which questions best. As reference librarians develop and work with hybrid collections of purchased, licensed, and freely available web resources, a better understanding of the questions most easily answered by each will emerge. The volume and diversity of information available on the web opens new possibilities to both reference librarians and users, but both must continue to keep in mind that at present it can be hard to find the information sought; once found, such information may later disappear (or at least move); and the accuracy of information found may be difficult to assess. Recalling the definition of “reference work” cited earlier as “reference transactions and other activities that involve the creation, management, and assessment of information or research resources, tools, and services,” it seems likely that more attention will be given to those other activities in order to enable users to serve themselves. To fully realize the promise of reference service in the digital environment, Michael Buckland argues that the objective should be to empower the user, developing organization and access mechanisms using digital technology and attentive to user needs and preferred modes of use.^[20]

Regional Library Networks: United States

Catherine C. Wilt

PALINET, Philadelphia, Pennsylvania, U.S.A.

Abstract

The U.S. Regional Library Networks (RLNs) are a loosely federated system of 15 membership organizations of libraries and related cultural organizations, established in the 20th century to facilitate access to information through resource sharing and cooperation among members. Created by librarians, the RLNs support their members through an array of services (predominately technology based) and provide a formal structure by which their members can work cooperatively to create programs members could not create individually. From as early as the 1930s, the RLNs have served as change agents and facilitators for the introduction and implementation of innovations into their members' operations, including the integration of large-scale technological systems such as Online Computer Library Center (OCLC). In the example of the RLNs' collaboration with OCLC, the result is a highly organized, now international, network of the world's bibliographic information, constituting a cooperative database development model that is unparalleled.

DEFINITION OF "REGIONAL LIBRARY NETWORK"

Because the term "network" is used to describe a variety of infrastructures and activities in the library and information industry, its use in describing a library service organization can be confusing. The formal definition of "network" implies a technical connection or system with numerous users. Within the library field, the term has been "a catch-all for a broad range of cooperative activities."^[1] The American Library Association (ALA) Glossary defines library network as "a specialized type of library cooperation for centralized development of cooperative programs and services, including the use of computers and telecommunications, and requiring the establishment of a central office and a staff to accomplish network programs rather than merely coordinate them." In contrast, library consortium is "a formal association of libraries, usually restricted to a geographic area, number of libraries, type of library, or subject interest, which is established to develop and implement resource sharing among the members and thereby improve the library services and resources available to their respective target groups."^[2]

Cooperation among libraries, librarians, and researchers has been a major force defining the nature and structure of library service programs for much of the 20th century. The benefits of working cooperatively and sharing resources toward collective achievements greater than the sum of individual achievements have been successfully demonstrated repeatedly. That success has resulted in one of the most organized models of cooperation within any industry in the United States.

An important, if not the most important, aspect of the RLNs is their social networking role, which is inherent in

the term "consortium." Librarians created the RLNs to support each member's library programs symbiotically through information and resource sharing, continuing professional development and support, research and development, and collaboration. The distinction between RLNs and consortia has become less clear in recent years, as their organizational structures and the services they offer are very similar. In fact, several long-standing RLNs have begun to refer to themselves as consortia or cooperatives.

HISTORY

The beginning of the individual RLNs in the United States is quite varied. The oldest RLNs are the Bibliographical Center for Research (BCR) and PALINET. These Networks were created as resource centers to facilitate interlibrary lending. Both received grant support from private foundations and the federal Works Progress Administration (WPA) to create union catalogs of library holdings to aid researchers in locating materials.

As a specific example, PALINET started in 1933 as the Union Library Catalog of the Philadelphia Metropolitan Area. A small group of Philadelphia historians, tired of the difficulties they encountered locating books in the numerous and scattered area libraries, issued a prospectus for the proposed union catalog. Ultimately housed at the University of Pennsylvania, the massive union card catalog was created, serving as the centralized resource for locating materials. Over time, this catalog became the tool that enabled interlibrary loan activities to commence among the participating libraries. Other related services naturally followed, such as the Duplicate Book Exchange, where

not needed duplicates were made available to other libraries.

Library networking drew much interest and attention in the 1970s. The ALA and the U.S. Office of Education cosponsored the landmark National Conference on Interlibrary Communications and Information Networks in 1970 to explore the library network concept and recommend a plan of action. This conference grew out of discussions acknowledging the enormous value of the nation's library resources and the need to develop interinstitutional networks among libraries for effective, affordable access to these resources. Recommendations from the conference included a call for the newly established National Commission on Library and Information Science to ensure financial support for developing network programs and to provide a broad base of public and legislative understanding of the need for a national network of libraries and information centers.^[3]

Much federal funding and standards development since that conference have supported the growth of library networks, library systems, and consortia to the point that now over 425 such organizations are listed in the American Library Directory.^[4]

One of the most important developments in library cooperation was OCLC. Founded by the visionary presidents and librarians of the Ohio College Association, OCLC's mission was to reduce libraries' costs by sharing cataloging records through a centralized database.^[5] This enabled libraries to use cataloging records already entered

by other libraries and to add original records that did not yet exist in the database.

In many cases, the first computers in libraries were OCLC terminals. Often they were also the first computers used within the libraries' parent organizations, e.g., campuses, school districts, municipalities. Libraries were positioned as technology leaders for computing within their institutions.

A leader in U.S. network development, Barbara Markuson, formerly Executive Director of INCOLSA, noted, "Library networks developed primarily as a mechanism to allow rapid technology transfer in the U.S. library system."^[1] "Networking provides unparalleled opportunities for a dramatic restructuring of the library as an operational unit and for an astounding array of new information services better designed to meet the needs of an increasingly complex user community."^[1]

REGIONAL LIBRARY NETWORKS TODAY

There are 15 independent library service organizations in the United States known collectively as the RLNs (see Table 1). They are a diverse group of organizations providing many unique programs and services, with OCLC the key service offered by all these organizations. Even though the RLNs are not exactly alike, commitment to cooperation, exceptional customer service, and innovative programs are common among them. Each RLN is a

separate entity with its own unique mission and characteristics. Some RLNs are federal or state agencies, e.g., FEDLINK and NEBASE; most are independent 501(c) 3 not-for-profit organizations, e.g., Amigos and SOLINET. Many Networks serve libraries in a single state, e.g., MLC (Michigan) and WiLS (Wisconsin); others serve members in a multistate region, e.g., NELINET and BCR.^[6]

Governance

The staff at the member organizations of RLNs are active participants in the governance of their respective Network. The RLNs are governed by Boards of Trustees/Directors or similar advisory groups, elected from and representing the membership. Some Networks' Board positions are designated to represent certain segments of the membership, e.g., type of library or state. Some have public, at-large Board members, people outside the membership and from the community at large with an interest in libraries and the Network. Two Networks, MLC and PALINET, now facilitate their Board elections electronically.

The Networks host annual membership meetings and conferences, some over multiple days. They facilitate the work of numerous advisory committees and user groups within the Network, including the work of their OCLC Members Council delegates.

Support

The RLNs employ nearly 500 staff to support their programs. In 2003, nearly 17,000 libraries are served by the RLNs. Communication with members is facilitated through numerous means: newsletters, technical bulletins, training catalogs, electronic lists, e-mail, and web sites. Most communications and publications are now distributed electronically.

Many Networks have "support" or "help desks" through which they provide member support. They are beginning to use chat and instant messaging as additional ways to communicate with members.

The web sites of the RLNs offer extensive information about their unique governance and membership structures, as well as detailed descriptions of their programs and services (see Table 2).

Alliance of Library Service Networks

In the 1980s, the RLNs founded the Alliance of Library Service Networks. Originally, an informal forum for RLNs to discuss issues of mutual concern, the Alliance has become an effective means by which the RLNs implement cooperative ventures. Of note are the recent national negotiations with LexisNexis[®] led by SOLINET and with the Oxford University Press led by NELINET and Nylink. These programs dramatically reduced the cost of database access to these electronic resources for member libraries,

many of which could never have financially afforded access to these resources. Thus, the Alliance has become a means by which the RLNs can reduce costs through collaborative partnerships with each other and with vendor partners to serve the entire U.S. library community: a model "network of the networks," as envisioned in the 1970s.

RELATIONSHIP WITH OCLC

A primary service provided by all RLN's is access to and support of OCLC, the international membership organization (<http://www.oclc.org/>) that originally developed and currently manages a shared cataloging and interlibrary loan system, which has become the de facto U.S. national bibliographic database. The ability of OCLC to operate outside of Ohio is due largely to the work of the RLNs nationwide in promoting the benefits of OCLC in their respective regions and providing OCLC-related technical support and training for their members.

The RLNs' relationship with OCLC started in 1970 with the Pittsburgh Regional Library Center (now part of PALINET), a year before the on-line shared cataloging system was introduced. Some Networks existed prior to the founding of OCLC, e.g., BCR and PALINET, as previously described. Others came into existence to provide OCLC support for libraries in their region, e.g., SOLINET and Amigos. In some cases, state libraries established service programs to support OCLC services in their state, e.g., ILLINET and NEBASE.

Initially, in determining how shared cataloging functionality would be provided for libraries outside of Ohio, some regional Networks proceeded to replicate the OCLC database for their regions, e.g., NELINET, Amigos, and

SOLINET, reflecting a distributed national catalog model. After study and testing, it was quickly determined that the more favorable means by which to provide this service was through the centralized OCLC system accessible via propriety telecommunications lines. OCLC telecommunications hubs were housed and managed by several of the RLNs.

Of the U.S. libraries participating with OCLC 99.9% do so through an independent RLN- or OCLC-owned Service Center. Reciprocally, libraries have a direct role in the governance of OCLC through their RLN or OCLC Service Center. The RLNs and OCLC Service Centers comprise the membership of OCLC's Members Council, a 66-person advisory group responsible for providing advice to OCLC on service development and for the election of 6 of its 15 Board members. Networks also facilitate the work and communication of their OCLC Members Council delegation. For more information on the OCLC Members Council, see <http://oclc.org/memberscouncil/default.htm/>.

As of September 2003, nearly 17,000 libraries were members of the RLN's. This represents 90% of the U.S. libraries participating in OCLC. The remaining 10% of U.S. libraries receive support and training from two OCLC-owned and operated Service Centers: the OCLC CAPCON and the OCLC Western Service Centers.

To participate in OCLC, libraries typically join the RLN or OCLC Service Center serving their geographic area, but may choose to join any RLN or OCLC Service Center of their choice. A map illustrating the geographic service areas for the RLN's and OCLC Service Centers is located at <http://oclc.org/contacts/regional/default.htm>.

In-depth information on the RLN's and OCLC Service Centers is available in *Networks and Service Centers: An OCLC Members Council Directory* at <http://oclc.org/memberscouncil/documents/directory.pdf>.

GROWTH OF REGIONAL LIBRARY NETWORK SERVICES

The array of services provided by RLNs has grown dramatically over the years and continues a rapid evolution as the needs of their members evolve and innovative technological solutions become available. Services include, but are by no means limited to, training and continuing education, access to electronic databases (full-text, and abstracting and indexing services), consulting, technical support, preservation, digitization, retrospective conversion, union listing, web site development and hosting, courier/delivery services, remote storage facilities, and electronic publishing.

In the 1980s, RLNs were among the first suppliers of e-mail and then internet access to their members. This is another example of how Networks facilitate the broad

adoption of new technologies by libraries through their extensive technical support and training infrastructure.

The RLNs have a long-standing role in advocacy on behalf of their members through national and international groups. Several RLNs are active participants in policy and standards organizations like the National Information Standards Organization, the Coalition for Networked Information, and the International Consortium of Library Consortia. Networks also work with regional and local groups to promote the role and needs of libraries.

Educational Programs

RLNs are well known and highly regarded for their training and continuing education programs. Thousands of library staff receive training in hundreds of classes offered by Networks annually.

Traditionally, training has consisted of instructor-led, in-person workshops held at the Network offices and at sites throughout each Network's specific region. In the past, self-paced courses were available in the form of workbooks, audio courses, and computer-based training. Recently, RLNs have made significant advances in the application of distance learning technologies to their training programs, bringing educational opportunities to broader audiences: those unable to travel and those who prefer a self-paced approach. The distance learning technologies implemented include videoconferencing, Web-based interactive workshops, and Web-based self-paced courses. Some Networks are beginning to include streaming video technology in their distance learning workshops.

Several RLNs have entered into cooperative training agreements with their Network colleagues. Still in the developmental stages, these programs now permit libraries to attend the training programs of other Networks at reduced cost. These alliances have the potential to expand greatly libraries' access to training.

As a natural extension of training, several RLNs offer custom consulting services. Consulting projects include, but are not limited to, workflow analysis of library operations and process reengineering, technology needs assessment, automation system selection, human resources development, web site design, facilities and buildings, database negotiation, collection development, and management of regional consortia.

Electronic Resources

Another primary service offered by most RLNs is access to electronic information resources. From the early years, the RLNs have provided access to traditional abstracting and indexing services such as Dialog and BRS. Electronic services have evolved dramatically to include full-text and image databases. The RLNs have effectively negotiated significant group discounts with hundreds of database providers, resulting in substantial cost savings to their

members. Each RLN will typically negotiate with each database vendor separately. There have been, however, examples of some excellent national discounts for databases, facilitated through the Alliance of Library Service Networks, e.g., LexisNexis® and the Oxford University Press electronic resources.

Amigos and Nylink have embarked on promising new electronic publishing ventures, supporting the electronic publication of intellectual property held in educational institutions and learned societies. Amigos is the American (United States and Canada) distributor for BioOne®, a collaborative project founded by the American Institute of Biological Sciences, the Scholarly Publishing & Academic Resources (SPARC), The University of Kansas, the Greater Western Library Alliance, and Allen Press, to provide electronic access to biological resources. Nylink has a similar alliance with Cornell University for Project Euclid, a nonprofit venture developed by Cornell University. These models have been instrumental in making journals from independent publishers and learned societies available electronically while preserving the publishers' intellectual and economic identities. These and related electronic publishing ventures bear continued examination as a means of keeping electronic resources affordable and the control of the intellectual property within the academy.

Unique Programs

The list of services provided by the RLNs is extensive. The following are a few examples of unique projects developed and managed by Networks:

- SOLINET and Amigos, with the support of the National Endowment for the Humanities, manage regional preservation education and support programs. As participants in a national network of regional preservation programs, they offer training in preservation treatment, needs assessment and disaster recovery, and preparedness.
- Several RLNs facilitate the development of digital resource collections. One example is Virtually Missouri, managed by MLNC and a collaborative project with the Missouri State Library.
- Amigos, Nylink, and MINITEX manage interlibrary delivery services for their members, enabling the rapid shipment of materials between libraries at reduced cost. These services are typically supported in part by the state libraries and like groups within individual RLN service areas.
- NELINET operates the New England Regional Depository, a remote storage facility. Members with limited space for collections may choose to store low-use materials at this facility and retrieve the materials as needed via delivery service.

CONCLUSIONS

Regional Library Networks in the Future

The RLNs have a long and successful history of assisting libraries with the integration of technology into their operations. The cost savings for libraries have been astounding, and the task of supporting and training so many libraries has been monumental.

As services mature and become mainstream, those services are often replicated by other consortia. With the recent increase in the number of consortia, many offering services competing with those offered by the RLNs, library administrators are faced with the dilemma of choosing between organizations with which to be affiliated. Those affiliations require staff resources to manage, and at some point, the duplicative relationships are no longer cost-effective. This has led to a waning in libraries' long-standing loyalty to their regional Network to the point that their choice to participate in any group is based solely on which has the lowest price for a specific service.

Therefore, the RLNs continue to be challenged to find the next set of innovative services to offer their members. To address this challenge, some RLNs have established research and development units within their organizations to identify the next areas in which they can provide value for their members. These units, coupled with the widespread assessment of member needs and satisfaction, position RLNs for the successful continuation of their role as leader organizations for libraries.

Susan Martin stated recently in "The Transformation of Library Networks," "Library networks are changing in character and concept in order to address changing technological, economic, and social needs of libraries and their patrons. Any idea that the network has gone away as a force in our environment is inaccurate. Rather, librarians need to recognize the strength the cooperative alliances have in shaping their future, and align their organization to deal effectively with these critically important partnerships."^[7]

Relevance in Theory

Howard D. White

College of Information Science and Technology, Drexel University, Philadelphia, Pennsylvania, U.S.A.

Abstract

Relevance is the central concept in information science because of its salience in designing and evaluating literature-based answering systems. It is salient when users seek information through human intermediaries, such as reference librarians, but becomes even more so when systems are automated and users must navigate them on their own. Designers of classic precomputer systems of the nineteenth and twentieth centuries appear to have been no less concerned with relevance than the information scientists of today. The concept has, however, proved difficult to define and operationalize. A common belief is that it is a relation between a user's request for information and the documents the system retrieves in response. Documents might be considered retrieval-worthy because they: 1) constitute evidence for or against a claim; 2) answer a question; or 3) simply match the request in topic. In practice, literature-based answering makes use of term-matching technology, and most evaluation of relevance has involved topical match as the primary criterion for acceptability. The standard table for evaluating the relation of retrieved documents to a request has only the values "relevant" and "not relevant," yet many analysts hold that relevance admits of degrees. Moreover, many analysts hold that users decide relevance on more dimensions than topical match. Who then can validly judge relevance? Is it only the person who put the request and who can evaluate a document on multiple dimensions? Or can surrogate judges perform this function on the basis of topicality? Such questions arise in a longstanding debate on whether relevance is objective or subjective. One proposal has been to reframe the debate in terms of relevance theory (imported from linguistic pragmatics), which makes relevance increase with a document's valuable cognitive effects and decrease with the effort needed to process it. This notion allows degree of topical match to contribute to relevance but allows other considerations to contribute as well. Since both cognitive effects and processing effort will differ across users, they can be taken as subjective, but users' decisions can also be objectively evaluated if the logic behind them is made explicit. Relevance seems problematical because the considerations that lead people to accept documents in literature searches, or to use them later in contexts such as citation, are seldom fully revealed. Once they are revealed, relevance may be seen as not only multidimensional and dynamic, but also understandable.

DEFINING RELEVANCE

Relevance is widely held to be the central concept in information science (IS). Discussions of it abound in the discipline, but there are so many conflicting accounts that some reviewers believe the term cannot be defined. Among the majority who believe otherwise, Rebecca Green's formulation of 1995^[1] captures something like the standard view: "Relevance is the property of a text's being potentially helpful to a user in the resolution of a need." Patrick Wilson in 1978^[2] was more succinct. Applied to a document retrieved by a query, "relevant" means "retrieval-worthy." What Wilson calls "the chief evaluative term in information retrieval" is simply the discipline's specialized form of the word *acceptable* or *good*. But where information retrieval (IR) systems are concerned, the acceptability or goodness of retrieved documents is a prediction, not a guarantee.

When IR systems are formally evaluated, judges decide the goodness of fit between documents and the sense of

the query that elicited them. In everyday life we constantly do the same thing less formally when we search the Web. Relevance is thus a variable; in judgments of documents it can take at least two values, "Relevant" and "Not Relevant," and many IR system evaluators have used scales that allow values in between.

Goodness of fit is most commonly based on the degree to which a document matches the *topic* implied by the query. However, for many years critics in IS have protested that relevance is not solely a matter of topical match, because a document need not be on a pre-expressed topic to be useful or helpful. For example, a passage in a document could count as evidence for or against a claim without matching the claim in topic. In like fashion, authors often cite documents that are topically unlike what they are writing about; a mathematical textbook, for example, could be relevant to articles in vastly different areas, from measuring the size of the Internet to estimating global warming. Conversely, a document that perfectly matched the topic

of a query could still be judged irrelevant because the potential user had already read it or had other grounds for rejecting it.

Despite these complexities, topical match remains the most important component of relevance as it is understood in IS. That is because topical match is something that IR system designers can design for, whereas other considerations, such as the novelty of the document to the user, are beyond their control.

This chapter explores these and other notions of relevance in IS theory and practice, including the long-running debate on whether it is subjective or objective or both. While relevance in IR is the main focus, there is some discussion of the concept as it motivates citers to link their documents to other documents. The chapter ends by suggesting that relevance, despite its complex and contested nature, is now reasonably well understood.

LITERATURE-BASED SYSTEMS

Although we may put our questions more readily to other people, we also want the powers that answers from literatures can give. When IS is defined as *the study of literature-based answering*, much else falls into place, including the oft-repeated claim that relevance is the central concern of IS.

“Literature-based answering” grounds *IR*, a traditional IS concern, in bodies of related writings such as are studied in *bibliometrics*. The phrase thus suggests the two main subfields of IS. “Answering” implies human questioners, since literatures cannot query themselves. And since they cannot respond by themselves either, it also implies that literatures must communicate through a system or systems of some kind. A questioning person and an answering system (and not pairs of persons) are the main dyad in IS. The strategically ambiguous term “information” in IS connotes both the answers that questioners want and the literatures (aka documents, writings, Web pages, material texts) that provide them. In Michael Buckland’s formulation,^[3] answers can be construed as messages expected to produce cognitive change on the human side (his “information as process”), and literatures can be construed as sources of that change on the system side (his “information as thing”).

While the questioner–answerer pairing implies a dialog, the pairing in this case is unusual in that one of the participants is human and the other, artificial. But dialogs between persons remain the point of reference, especially where implicit expectations are concerned, because that is humanity’s default setting. Answers from literatures, that is, will be held to much the same standards as answers from persons. For example, just as we rarely want persons to lie to us or be mistaken in what they say, we do not, as a rule, want to be presented with lies or errors from literatures. We want *truthful* answers,

which Patrick Wilson^[2] defines as information in the strong sense, as opposed to misinformation or disinformation. At the same time, we want *relevant* answers—answers appropriate to *what we meant* by our questions as put. In practice, this usually includes their being on topic or relatable to the topic by inference. Wilson characterizes literature-based answers that are topically appropriate but of uncertain truth value as information in the weak sense or “content.” Information in his strong sense is *what is known* about a matter; in his weak sense, *what has been said* about it.

Notoriously, systems can also deliver answers that miss the intended topic altogether. This is annoying, especially if such answers are numerous. The more dangerous possibility, however, is the system-supplied answer that is highly relevant but *false*. Imagine that your happiness depends on your catching a certain train, but the timetable you trusted—surely a relevant text—is outdated and the train no longer runs. Or imagine entrusting your eternal fate to scriptures that, although applicable to your case, happen to be wrong. If “information” is taken in Wilson’s strong sense, these are examples of literature-based answering but not of IR. Indeed, much of what is called IR is content retrieval at best. IR that *consistently* informs in any domain is still science fiction.

In their standard textbook,^[4] Ricardo Baeza-Yates and Berthier Rebeiro-Neto distinguish IR from *data* retrieval. In the latter, likely questions and appropriate answers are foreseeable, and systems can meet strict standards of relevance. Such systems are often databases that accept regimented language in limited domains—for example, telephone directories, personnel files, flight monitors in airports, dictionaries, topographical maps, stock price listings, and theater pages. Relevance is not a major issue in judging the performance of these nonbibliographic systems (and IS has had little to say about them), because the ability to match query statements with answer statements in them is seldom problematic. (Flight monitors, a boarding pass, and signs at the gate all answer the airline passenger’s predictable question, “Where’s my plane?”) In contrast, the literature-based systems of IR are portals to relatively unstructured full-text writings that may or may not speak to inquirers’ real questions, and relevance *is* problematic in judging their outputs.

When systems deliver multiple possible answers, we apparently screen first for relevance and only then for truthfulness; the truth value of what we filter out remains a matter of indifference. But we make other judgments as well. In our dialogs with systems no less than people, an invisible meter is running, and we want answers that are both timely and of acceptable length. Qualitatively, they should convey neither more nor less than we want to know, and they should not merely repeat what we know already. These latter requirements may be seen as components of relevance along with topical appropriateness.

INTERMEDIARIES AND DISINTERMEDIATION

A major way of obtaining true and relevant answers from systems has been to rely on human intermediaries who can connect questioners with the right parts of literatures because they understand both explicit and implicit criteria for what is wanted. (By giving answers from writings rather than from their own heads, they act as mouthpieces for systems rather than as communicators in their own right.) While the obvious example is reference librarians, anyone with sufficient expertise can play this role. With writings, however, neither sentences nor passages nor entire texts are marked as to truth value, which means that intermediaries will frequently be unable to guarantee the truthfulness of the answers they supply. At best they can retrieve one or more texts that have passed through society's (and perhaps their own) mechanisms for establishing veracity—crude editorial filters that may nevertheless screen out the blatantly false. As for relevance, intermediaries may be able to guarantee topically appropriate content because, given sufficient conversation, they can pick their way through the homonyms, synonyms, pronouns, and other complexities of natural language to understand what questioners mean. They can disambiguate what they hear and respond in a way that, in the dictionary definition of relevance, “bears on the matter at hand.”

Even so, the problem that has always most interested information scientists, including those of precomputer times, is how to make writings respond to questioners in these ways *without benefit of human intermediaries*. IS explores disintermediation in the sense of replacing workers in libraries and bibliographic publishing houses with devices and machines. (“Library automation” is a historical synonym of IS.) Unlike people, bundles of selected texts can be made universally and perpetually available. But can they be induced to perform like a helpful human agent? Can they be made as easy to query as a person? Can they be turned into something that forestalls the need for endless exploratory reading by responding truthfully and to the point and in real time?

The only reply at present is, *sometimes*. We still lack, and are not likely to have soon, systems that understand language like a human conversationalist. What we have instead, and have always had, are systems that match the words in people's questions with words in texts that may yield good answers or at least cater to interests. The premise in many of these systems is that users' words will be mapped onto text-words through intervening vocabularies—that is, through indexing. But, as noted earlier, the truthfulness of textual statements is not explicitly marked—not indexed—and so no metadata exist for word-matching technologies to operate on. The problems of supplying information in the strong sense must be addressed through publishers' quality-control measures, such as peer review of scientific articles or

periodic updating of reference works, that IS has always more or less taken for granted. That leaves word-matching systems to address the other major requirement in dialogs—that answers be relevant to questions. Human beings have a natural gift for relevance in verbal exchanges, but our best attempts to duplicate this gift artificially are as yet far from wholly successful. All that can be said is that, through schemes developed over centuries, we have some chance of matching people's question-texts with appropriate answer-texts from literatures. It is relevance in this sense that preoccupies information scientists, who have long foregrounded the problems involved. A concern with relevance is central to the study of human communication in general, but it becomes acute in IS, where systems can respond only through artificial substitutes for human capacities, such as computer programs and indexed stores of writings.

What IS really deals with, then, are system-supplied answers that may or may not be truthful and that may or may not be relevant to users' real questions. Exactly the same may be said of answers from people, of course, but we want our information systems to avoid or minimize human imperfections. Ironically, the study of user-system dialogs in IS has shown that limitations of users for which systems cannot compensate are in no small part the source of failures of performance. On their side of the dialog, users do not know (and are often too impatient to learn) how to put queries so as to get the answers they want. On the opposite side, designers still cannot cope with all the complexities of natural language (let alone people's unspoken expectations) and so routinely turn out systems that either overwhelm users with irrelevant answers or produce no answers at all. This is not to say that successes are not also frequent; merely that attempts to communicate with literatures meet with barriers not easily removed.

SOME HISTORICAL PRECEDENTS

It is worth noting that systems for delivering relevant answers from literatures without human mediation appeared long before the computer. For example, Melvil Dewey's widely used decimal classification system, which dates from 1876, underpins an attempt to build an answering device out of library books themselves. The word-bearing bookspines are shelved in standardized subject classes to curb the unconstrained vocabularies of authors and to respond relevantly to inquirers facing them. One might even see in these massed books an incipient artificial intelligence possessing some of the characteristics of a person. In any case, the system anticipates how we will ask for items of interest to us and suggests, through proximity, other items of potential interest. It is, in today's lingo, a “recommender system.”

Complementing it, Dewey's “Relativ Index” (thus spelled) alphabetizes thousands of terms both in and not

in the classification schedules and maps them onto the decimal classes. Thus people can look up noun phrases in their questions alphabetically and find the corresponding Dewey classes (often more than one) without knowing the nonintuitive decimal order. This easing of the mapping process may be seen as Dewey's move to make his scheme more responsive—more relevant—to users.

The full-scale alphabetical index that was added to Peter Mark Roget's *Thesaurus* in 1879 is a close analog. The *Thesaurus* was first published in 1852 as a list of words in classified order. According to David Crystal (p. 158),^[5] "Roget assumed that his readers would be able to find their way through the *Thesaurus* by working intuitively down through his classifications. He added a short alphabetical index, but it was left to his son, John Lewis Roget, to develop this in the 1879 edition into a major feature of the book." Again we see an attempt to make a less-than-intuitive system respond more relevantly in user-system dialogs. As confirmation in this case, the son's index contributed to increased sales and became almost everyone's doorway into the *Thesaurus*.

Another nineteenth-century example of designing for relevance is the subject cataloging system devised by Charles A. Cutter. Francis Miksa^[6] relates that Cutter, in his *Rules for a Dictionary Catalogue* (first edition 1875; fourth edition 1904), advocated entering books under *the most specific* subject heading that matched their entire scope (e.g., he would put a book on cats under "Cats" not "Domestic Animals"). In making headings for complex topics without established subject names, he preferred *concrete individual nouns* to *concrete general nouns*, and the latter to *abstract general nouns* (e.g., he would put a book on the ornithology of Massachusetts under "Massachusetts" with a cross-reference from "Ornithology"). These principles derive from Cutter's faith in the psychology of mental faculties advanced by eighteenth-century Scottish philosophers such as Thomas Reid. That faith was probably misplaced, but there can be no doubt that Cutter was trying to increase the relevance of subject cataloging—and hence library collections—to users by designing headings that conformed to what he took to be laws of human thought. In this, he was acting much like Peter Roget before him and the designers of search engines today.

Cutter's work anticipates twentieth-century thesauri that predate the computer—for instance, the Library of Congress Subject Headings (LCSH) for books and the Medical Subject Headings (MeSH) of the National Library of Medicine for journal articles. Such tools contain controlled vocabularies for building verbal bridges between writings and users. A look at what "control" means in them sheds additional light on how relevance is sought in literature-based answering.

The vocabularies make explicit certain abilities of an answering person, who, though absent, serves both indexers and literature searchers. The ability to understand that

different expressions have a common underlying meaning is imitated by establishing a preferred expression and linking synonyms to it with *See* or *Use* references—for example, "Attorneys, *See* Lawyers." The ability to connect an expression with its nonsynonymous conceptual neighbors is imitated by *See Also* or *Related Term* references—for example, "Lawyers, *See Also* Judges." For hierarchical neighbors, *Broader Term* or *Narrower Term* references are added—for example, in the "Guns" hierarchy, "Weapons" is *Broader* and "Pistols" is *Narrower*. The ability to discriminate among homonyms is imitated by attaching indicators of sense—for example, "Interest (Monetary)" versus "Interest (Psychological)." Finer shadings of word-knowledge can be imitated by full-sentence scope notes, as when "Bibliometrics" is differentiated from "Scientometrics" or "Informetrics."

While all of these aspects of vocabulary control may seem old hat, they in fact serve as ways of inducing relevance that Google and several other search engines now lack. These engines process not indexers' controlled vocabulary but authors' and users' natural language to provide near-instantaneous answers from a very wide range of writings. The answers returned, sometimes numbering in the thousands, are algorithmically ranked high to low by predicted relevance to the query. Identification of the *best* answer, if it exists, is left to users. But the lack of vocabulary control as a screening device guarantees the frequent appearance of answers that are largely or entirely irrelevant. At the same time, other potentially relevant answers are not returned because they do not match users' input terms.

RELEVANCE IN SYSTEMS EVALUATION

The example just given implicitly pits natural-language retrieval against controlled-vocabulary retrieval, or perhaps Google against a search engine built with different algorithms. Which is better? The answer leads us back to why the concept of relevance is central to IS. A major historical reason is that, from the 1950s onward, it has been central to the most challenging practical enterprise in IS—the design and evaluation of IR systems. The intent is always to discover explicit operations on explicit bodies of texts that designers can use to improve system performance. Toward that end, researchers have recruited people to judge the goodness of retrievals in experimental trials because they thought this would eventually show the most effective techniques for retrieving relevant answers and blocking irrelevant answers.

The thinking goes something like this. Given a large collection of documents containing wide-ranging discourse, the goal of an IR system is to retrieve documents that satisfy unforeseen requests: those that adequately answer a question or that speak appropriately to an interest. At the same time, the IR system should screen out

documents that fail to do these things. For any query put to the system, there is a set of documents that *should* be retrieved because they meet the specifications of the request—in the words of IR evaluators, are relevant to it. Assuming that these documents can be retrieved in comparable ways, such as by natural language or by controlled vocabulary, one can set up retrieval trials to see how many of these documents are in fact retrieved by each competing mode, and how many are missed. One can also see how many documents each mode retrieves that in fact *should not* have been: they are somehow unsuitable, even though their indexing matches the language of the input request. Finally, one can relate these counts to the size of the entire collection from which retrievals are made.

There is a persistent technical problem in determining the total number of documents in a collection that are relevant to a request. Either the entire collection must be examined to find them, or, if that is impracticable, the total must be estimated. Examining collections for relevant documents query by query is highly laborious, but it can be done: some documents are prejudged as relevant, and then various competing means are used to retrieve them. The alternative is to take each query, perform a retrieval, have a judge identify relevant and irrelevant items, and then try to estimate through additional searches or sampling techniques the relevant documents that the first search missed.

In the pioneering days of IR experiments, relatively small test-bed collections of documents were used to compare the effects of different forms and levels of indexing and different search strategies. Since the 1970s, larger operational collections have been similarly evaluated. Regardless of size, the standard summary measures for individual tests are computed from data partitioned as in Table 1. The cells are filled in as follows: *a*, a count of documents that should have been retrieved and were—the hits; *b*, a count of documents that should not have been retrieved but were—the junk (also called noise, false alarms, false positives); *c*, a count of documents that should have been retrieved but were not—the misses (also called false negatives); and *d*, a count of the remaining collection correctly dodged in the retrieval.

Once these numbers are known, common summary measures for evaluation—precision, recall, and fallout—can be computed. Precision is the proportion of retrieved

documents that are relevant: $a/(a + b)$, the higher the better. (In systems that rank documents by relevance, the upper ranks should have higher precision than the lower.) Recall is the proportion of all relevant documents that are retrieved: $a/(a + c)$, also the higher the better (except when reading is to be minimized, or the *absence* of hits is desired, as in some patent searches). Fallout is the proportion of all irrelevant documents that are retrieved: $b/(b + d)$, the lower the better. (With large collections, one wants a relatively tiny fraction broken out.)

Further interpretations and refinements of these summary measures need not detain us here. The key point is that the measures depend crucially on what documents have been declared relevant. “[I]n using recall and precision ratios,” writes Cyril Cleverdon (p. 171),^[7] leader of the classic IR evaluation studies at the Cranfield Institute of Technology in England, “it is not relevance which is being measured, but the decisions regarding relevance that have already been made.” If those decisions are often faulty across retrieval trials, then comparative evaluations of IR systems are neither reliable nor valid. For half a century there has been a battle in IS over whether relevance can be objectively determined, as it must be if tables like Table 1 are to be believed. Naysayers hold either that relevance is altogether subjective or that it has both objective and subjective sides, and that the latter is more important.^[8–10]

In the culture of Cranfield-style IR evaluation, relevance is presumed to be objective. It is like a “beep” that only certain documents emit (perhaps in varying strengths) when matched against the user’s input terms. Table 1 is in fact historically related to tables in the field called signal detection theory (SDT). Indeed, one of the creators of SDT, John A. Swets, applied it to the results from three large-scale IR evaluation studies of the 1960s.^[11] But, as noted, critical information scientists have long argued that the “borrowed toolbox” from SDT is not right for evaluating IR systems. These critics doubt that *relevance to a request* is a good criterion for judging documents and filling in the cells of Table 1, because the concept has not been well operationalized. It has not resulted in quick, reliable agreements on what is at issue, and some would say it cannot.

As input, SDT uses data on people’s ability to discriminate between signal (noteworthy items) and noise (unnoteworthy items) under conditions of uncertainty. However, in typical SDT studies the phenomena from which signal and noise emerge are well defined and could be readily agreed on by judges. For example, if enemy planes are the signal and friendly planes are the noise, military spotters might misjudge some enemy planes as friends, or some friendly planes as enemies, but they would not be in doubt as to what they were monitoring. An analogous case involves faces. In an STD study described on the Web, people were asked to memorize faces from a pictured set. They were then shown pictures

Table 1 Table for computing standard IR evaluation measures.

	Relevant	Not relevant	
Retrieved	<i>a</i>	<i>b</i>	<i>a + b</i>
	Hits	Junk	Hits + Junk
Not	<i>c</i>	<i>d</i>	<i>c + d</i>
retrieved	Misses	Dodged	Misses + Dodged
	<i>a + c</i>	<i>b + d</i>	<i>a + b + c + d</i>
	Hits + Misses	Junk + Dodged	Total collection

of individual faces and asked whether each was one they had seen earlier. Their correct and erroneous responses can be captured in four cells just like those for relevance judgments in Table 1. But, unlike the abstract and protean relation called relevance, it is easy enough to say what they were judging. Swets himself noted that relevance is a thorny problem in IR and sidestepped defining it himself, although he based his large-scale statistical analysis on data involving relevance judgments that others might consider suspect.

OBJECTIVE RELEVANCE

Of the various grounds for deciding a document is relevant to a request, three seem most likely to be considered objective. The first is that a document constitutes evidence for or against an inquirer's claim. The second is that a document acceptably answers an inquirer's question. The third is that a document is on (or about) the inquirer's stated topic of interest. To comment briefly on these possibilities in turn:

Evidentiary relevance. That something counts as evidence for or against a claim is the *definition* of relevance, according to many dictionaries. The objective quality of such evidence can be tested when claims are made public in, for example, science, scholarship, or courts of law. But bringing evidence to bear is a creative act. Just as documents are not indexed by their truth value, so they are not indexed by their evidentiary value in strengthening or weakening an assumption or a case. If they are not already known, they cannot be retrieved simply by entering a claim (or topical noun phrases from a claim) in an IR system. (Citation indexes might sometimes lead to them, but only if they have already been used and cited by another author.) As a result, IR evaluation tests do not involve judgments on the value of documents as evidence for claims.

Question relevance. Questions and proper answers are logically related. Don R. Swanson writes (p. 392):^[12] "The idea of objective relevance is perhaps clearest in the case of requests that leave little room for subjective interpretation—for example, requests that entail questions about the physical world. A document that gives the vapor pressure of mercury at ten different temperatures is objectively relevant to the question, How does the vapor pressure of mercury depend on temperature?" William Cooper shows that, in pairings of this type, objective logic guarantees the relevance of certain answers to questions.^[13] Similarly, objective logic makes proofs relevant to theorems in mathematics (even if relatively few persons can follow them). "In such cases," Patrick Wilson writes (p. 458),^[14] "we presume the existence of a relationship that holds whether or not it is noticed, one about whose presence or absence we can be mistaken, and one that can be investigated by other than purely psychological

means." Swanson and Wilson view objective relevance as arguable in principle; it can be intersubjectively determined if it meets standards of criticism (such as the possibility of being proven wrong).

Topical relevance. IR studies involving topics are more common than studies involving questions. Questions are sentences, whose syntax clarifies their meaning. By contrast, statements of topics are usually only noun phrases, not all of whose possible meanings were intended by the person submitting them. Moreover, even when disambiguated, topics lack sharp cognitive boundaries. While judgments on them are far from wholly subjective, the notion of a document's being on (or about) a topic depends on judges' interpretations, which vary. (Different indexers are likewise known to vary in how they index the same document.) Sometimes most or even all judges agree that a document matches the sense of a given topical request. Other times, they do not. For example, Swanson recalls a well-known clash between judges from two organizations in 1953 (p. 390):^[12] "After each team had reviewed all of the retrieved documents, they jointly agreed that 1390 documents were relevant to the ninety-eight requests, but there were an additional 1577 documents that were considered relevant by one team but irrelevant by the other, a rather large arena of disagreement." Studies rarely if ever make the reasons for such disagreements explicit (a point to be further considered below).

DEGREES OF RELEVANCE

Like goodness, relevance for most information scientists admits of degrees. Some researchers have asked judges to measure it on nine- or seven-point scales or by marking an unmarked line representing a continuum (no relevance at left, complete relevance at right). Other researchers have called for simple binary judgments. Table 2, which reproduces instructions to judges on using a five-point, a three-point, and a binary scale, shows how researchers have operationalized the measurement of relevance in three major studies from the past 40 years.^[15–17] They treat it as if judges can assess the retrieval-worthiness of documents without a great deal of explanation.

Also admitting of degrees is the *focus* of an inquiry, which ranges from a specific question with a definite answer to a broad and nebulous interest that any number of documents might satisfy. The study by Saracevic and others^[16] used five-point scales to capture the range of specificity, as well as clarity and complexity, in questions. The 1966 Cranfield study (pp. 185–200)^[15] illustrates something of this range in the questions that were used in retrieval tests in aeronautics. Very specific: "How do interference-free longitudinal stability measurements (made using free-flight models) compare with similar measurements made in a low-blockage wind tunnel?"

Table 2 Scales and instructions for judging relevance in three studies.

<i>Instructions to Relevance Judges, Aslib Cranford Research Project</i>	
Mark as (1)	References which are a complete answer to the question. Presumably this would only apply to supplementary questions. . .since if they applied to the main question, there would have been no necessity for the research to be done. ^a
Mark as (2)	References of a high degree of relevance, the lack of which either would have made the research impracticable or would have resulted in a considerable amount of extra work.
Mark as (3)	References which were useful, either as general background to the work or as suggesting methods of tackling certain aspects of the work.
Mark as (4)	References of minimum interest, for example, those that have been included from a historical viewpoint.
Mark as (5)	References of no interest.

^aThe judges were aeronautical engineers who were scoring the relevance of (a) papers they cited in their own works to (b) questions they themselves created for the study. Those are the “supplementary questions” referred to; the “main question” was the one their own works answered—HDW.

<i>Instructions to Relevance Judges, A Study of Information Seeking and Retrieving</i>	
The following definitions have been provided to users for judging the answers (i.e., abstracts):	
“Each abstract should be evaluated according to its degree of relevance to the question you submitted for searching. The degree of relevance should be determined using the following three-point scale:	
Relevant—Any document which on the basis of the information it conveys is considered to be related to your question, even if the information is outdated or already familiar to you.	
Partially Relevant—Any document which on the basis of the information it conveys is considered only somewhat or in some part related to your question or to any part of your question.	
Nonrelevant—Any document which on the basis of the information it conveys is not at all related to your question.”

<i>Instructions to Relevance Judges, Text Retrieval Conference (TREC)</i>	
Relevance judgments, or the “right answers,” are a vital part of a test collection. TREC uses the following working definition of relevance: If you were writing a report on the subject of the topic and would use the information contained in the document in the report, then the document is relevant. Only binary judgments (“relevant” or “not relevant”) are made, and a document is judged relevant if any piece of it is relevant (regardless of how small the piece is in relation to the rest of the document).	

Source: National Institute of Standards and Technology. Data—English retrieval judgments, 2000. http://trec.nist.gov/data/reljudge_eng.html.^[17]

Quite general: “[I want] papers on pressure and force distributions on wings.”

Reflecting similar differences in scope decades later, the Text REtrieval Conference sponsors “tracks” in which researchers compete not only in retrieving entire documents but in algorithmic answering of specific questions from TREC test collections. The question–answering track,^[18] whose test collections are drawn from large corpora of news articles, is “designed to take a step closer to IR rather than document retrieval.” For example, an actual TREC question is:^[19] “What is the relationship between poverty and disease?” TREC’s gloss on acceptable answers (supplied for all questions) states: “Documents that do not link poverty to diseases directly but mention a link between poverty and health care are relevant. Documents that simply mention poverty and disease but do not draw a connection are not relevant.”

In daily life, questions are put constantly, and everyone routinely judges the degree to which answers are relevant. (To “Where’s our flight?” the answer “Gate B9” is both relevant and *more* relevant than “Somewhere in Terminal B.”) While the questions in the TREC question–answering trials are the special kind asked at reference desks, the cognitive skills required to judge the

answers for relevance (if not truth-value) are the same ones people use successfully every day. It therefore should be easy enough to score answers, especially with the glosses TREC provides. For example, millions of people could judge answers to the request for articles on the relationship between poverty and disease. Many of them could at least *recognize* apparent answers to the technical Cranfield question about longitudinal stability measurements in aircraft, even if they were unfamiliar with the aeronautical vocabulary. Moreover, people would probably agree on what documents contained answers, as opposed to those that did not, even if they did not always agree on the *best* answer.

However, these are examples of inquiries at the specific-question end of the scale. When the focus is broadened from specific questions to interests expressed as topics, people tend to agree less on what literature-based answers are relevant. They read different things into noun phrases expressing topicality (such as the request in the Cranfield study for “papers on pressure and force distributions on wings”) and produce inconsistent results.

As noted above, such inconsistencies have prompted the claim that relevance on the user side is subjective or that relevance has an objective component (documents

that match the stated topical request) and a subjective component (documents that for any other reason are retrieval-worthy). Swanson writes (p. 397),^[12] “For the most part, bibliographic retrieval systems are topic oriented, and topics are presumed to be objectively defined and applied. However, the question of whether a document is or is not about some topic can depend on the observer’s point of view, and so a subjective element may intrude into a topic-oriented relevance judgment.” In *Information Retrieval*, an influential textbook in the Cranfield tradition, C. J. van Rijsbergen states flatly that relevance is subjective (p. 146).^[20] However, he seems to have in mind something like Swanson’s mixture, since he, like other Cranfield-style researchers, thinks there is enough agreement among judges for IR evaluation tests to be successfully conducted.

Contributing to the supposedly subjective component are factors such as the user’s expertise, situation, work task, cognitive style, and stage of searching; the amount of information provided about the document; and the conditions under which judgments are made. Linda Schamber extracted from IS studies some 80 variables that supposedly affect relevance judgments (p. 11),^[21] and her unprioritized list is not exhaustive.

WHOSE SUBJECTIVITY COUNTS?

Surrogates, such as students, librarians, or subject experts, have replaced end users as judges in many retrieval evaluation tests. In the limited time periods of the tests, what can they reasonably be expected to do? Can they judge whether short, specific answers adequately respond to a set of short, specific questions? Yes. Can they compare a set of retrieved citations plus abstracts with a request and decide whether each has the same sense as the request? Yes again. Crucially, however, such judges lack a stake in the information they are given because they lack real needs generated by real projects. The only criterion by which they can reasonably be asked to evaluate retrievals is whether a retrieved document answers a question or matches a topic. Since this tells us little about the relevance of the document (or passage or phrase or image) to the person who asked for it, they cannot judge documents validly, and—so goes the critique—it is fatuous to base system evaluations on their opinions.

By this light, the only judge of relevance worth considering is the person who requested the information. Consider again Green’s definition: “Relevance is the property of a text’s being potentially helpful to a user in the resolution of a need.” Her wording allows surrogate judges to judge relevance by topicality, because any document they deem to be on topic—even mistakenly—is at least *potentially* helpful. But for evaluations to be convincing—again, according to the critique—relevance should depend on whether a text *actually* helped an end user resolve a need.

Only end users can decide whether they benefited cognitively from seeing a particular system-supplied document. Only they can connect documents with ideas material to their projects. Only they can know how well documents capture the *intended sense* of their search terms, despite literally matching them.

Consider further that systems can respond to user needs only as they are expressed in language the systems can accept. That means that the needs must be couched in words that explicitly match either controlled vocabulary or authors’ natural language. However, neither type of indexing permits easy matches on pieces of unknown text that users might find *extremely* relevant: evidence for their new claims, original appearances of a concept, good examples of some phenomenon, ways of putting a complex matter in a nutshell, critiques not labeled as such, interesting analogies, lucid popularizations, fruitful metaphors, anecdotes appropriate to a context, linkages between hitherto unlinked ideas, better methodologies than those already used, arguments paralleling one’s own, discussions of terms as terms, and so on.

While another person could help find these desiderata, more often they can be found only by creative reading over time. They are not quickly retrievable through an IR system because they cannot be adequately expressed in any language known to IR. They depend on interactions with full texts, not indexing. Given enough time, readers do find them, but they are not generally available as criteria to judges in IR evaluation tests.

So, if one cannot ask for the inexpressible, what *can* be expressed to IR systems? Other than bibliographic data such as titles, authors, and journals, what can be entered as search terms? Practically speaking, the answer turns out to be: phrases representing topics and phrases representing questions. This would seem to put users and surrogate judges back in the same boat as they decide on the goodness of document retrievals. According to many information scientists, however, it does not. For them, “objective system relevance” as achieved by term-matching goes out the window, to be replaced by something like Buckland’s “information as process.”

The judges in Cranfield-style evaluations must regard requests to the system as indicators of a fixed user need, to which the documents retrieved by the request are a fixed response, complete in itself. Even if searches are revised to take user feedback into account, it is assumed that the underlying need does not change. In sharp contrast, the needs of real-world users and the requests they lead to are constantly changing, sometimes over long periods. Such users draw on IR systems progressively, taking in new information to reach new conclusions or revise old ones. This fact prompted Stephen Harter to argue that “user need” should not be equated with the *initial* state of consciousness that led to a request but with the dynamic *current* state (p. 606).^[22] It prompted Marcia Bates to advocate a “berrypicking” model of literature

retrieval over the classic Cranfield model. In her words (p. 421):^[23] 1) typical search queries are not static but rather evolve; 2) searchers commonly gather information in bits and pieces [like berries] instead of in one grand best retrieved set; 3) searchers use a wide variety of search techniques which extend beyond those commonly associated with bibliographic databases; and 4) searchers use a wide variety of sources other than bibliographic databases.

RELEVANCE THEORY APPLIED

Opposition to static topicality as the sole basis for relevance judgments is now commonplace among information scientists. In making his case against it, Harter^[22] adapted Dan Sperber and Deirdre Wilson's relevance theory (RT) from linguistic pragmatics. He was attracted to their ideas because, although their book^[24] deals mainly with talk between persons, they treat relevance at a level of psychological complexity appropriate to serious users of literatures (e.g., writers who cite for many reasons) and not merely as a verdict on topical matches.

In briefest summary, RT says that the relevance of any communication varies directly with its cognitive effects in a context and inversely with the effort it takes to process—that is, $\text{Relevance} = \text{Cognitive effects} / \text{Processing effort}$. (The more pronounced the effects and the smaller the effort, the greater is the relevance.) Human beings experience communications by means of this ratio automatically. Cognitive effects are the new inferences drawn when a new message interacts with a person's existing assumptions in a context. In general, the new inferences add to, cancel, or strengthen or weaken the existing assumptions. Such effects can be ordered by degree although they cannot be precisely measured. Processing effort serves as a brake on the potentially endless multiplication of cognitive effects; whatever inferences are *easiest* to draw are the ones we stop at. Possible effects that are harder to process are eliminated.

Extrapolating from RT, Harter argues that if a document produces little or no cognitive effect after it has been read, the fact that it is on topic does not matter; it is not relevant. Conversely, if, upon reading, the document does have a cognitive impact, it *is* relevant, even if it misses one's expressed topic of interest. The issue becomes, did a document, for whatever reason, prove informative? Did exposure to it yield valuable new inferences? The document's novelty and whether its appearance is well-timed (given one's current cognitive state) may also contribute to its impact. Other components of relevance mentioned earlier, such as whether a document is acceptable in length and neither under- nor over-informative, can now be seen as related to processing effort.

The addition of processing effort to the concept of relevance improves IS theory. Following RT, we may

infer that the harder a communication is to process, the more likely it will be rejected or ignored; it literally becomes *less relevant*. This goes for entire IR systems as well as individual messages. (Recall that Dewey, J. L. Roget, and Cutter all acted to reduce the effort of using their systems, so as to increase their perceived relevance to users.) Reviews by Herbert Poole^[25] and Thomas Mann^[26] show that, when people interact with information systems, they tend to attain relevance not by seeking high cognitive effects but by minimizing processing effort. (George Zipf's phrase, the "principle of least effort," is often adduced in this regard,^[27] and Herbert Simon's notion of "satisficing"^[28] is also related.) Yet, over the years, the least-effort studies and the copious writings on relevance in IS have generally been separate streams of analysis. The RT formula for relevance has rich implications for uniting the two streams, as Howard White argues.^[29]^[30] The numerous variables seen in the IS literature on relevance (such as many of those tabulated in Schamber's review) become more meaningful and less miscellaneous if they are organized as either cognitive effects or as determiners of processing effort.

This line of reasoning from RT further allows that a document's being on topic may indeed contribute to its cognitive effect and hence its relevance. Harter dwells more on the point that people *create* relevance by seeing connections across topics, a point Swanson also makes.^[12] But while topical relevance is far from being the only kind, it remains a very important kind, as Kelly Maglaughlin and Diane Sonnenwald found.^[31] (We want neither our conversational partners nor our IR systems to be constantly changing the subject.) Relevance theory's inclusion of processing effort in the relevance formula leads to insight here: topical match is an important component of relevance because it depends on explicit language and is *relatively easy to see*. Harter calls it "weak relevance" (i.e., subject to quick negation), which resembles Green's calling a document "potentially helpful." Thus, we can better understand why surrogate judges are used in IR evaluation tests: it is because they can recognize weak relevance (as potential helpfulness) in documents. They can stand in for end users because they share this ability with them (and are often more convenient to work with). Judgments on topical match, in other words, have high, although far from perfect, intersubjectivity.

It nevertheless remains true that judges cannot accurately take into account all the other factors that affect the relevance judgments of actual users—implicit factors that only the latter perceive. What is hard or impossible for judges to evaluate may be easy for users with project-driven needs.

Harter's criterion for a relevant document^[22] is whether it produced in him a desirable cognitive effect, regardless of where, how, why, or when the document was obtained. This cognitive effect ("psychological relevance" for him; "subjective relevance" for Swanson) exists only for the

end user who *wants to create new knowledge*. The experience of surrogate judges in IR tests is not comparable, and to assign relevance judgments to them is considered a serious error by Swanson. Swanson (p. 139)^[32] says, “We therefore infer that a consensus as to whether a particular document is relevant to some request is meaningless, for this notion of relevance has meaning only in the mind of the one person whose information need gave rise to the request.” If consensus with other judges is nevertheless sought and reached, it can only be on the relatively trivial grounds of topic match. The Harter-Swanson critique vitiates Cranfield-style tests of particular IR systems, and in fact Harter writes (p. 612):^[22] “I no longer believe that there is a valid interpretation of the meaning and results of such tests.”

A key consideration for Harter is *whether the document is read*. All the valuable “finds” mentioned earlier, such as evidence for claims, interesting analogies, good examples, and arguments paralleling one’s own, are discoverable only by someone interested enough to read documents at length. Surrogate judges cannot be presumed to have interests this strong, and they are generally asked to read only brief forms of documents, such as a citation plus abstract.

Users, too, of course, need not read a document to form some opinion of it, and a glance will tell them more than its subject matter. According to a study by Carol Barry,^[33] they go also by their impressions of authors, the quality of a journal or publisher, the apparent specificity or generality of what is discussed, the apparent difficulty of the exposition, and about 20 other implicit criteria. Even so, lists such as Barry’s merely complement topical relevance; they do not invalidate it. Judy Bateman (p. 30)^[34] shows that students rate topic-match highest among the criteria in their literature searches. Moreover, if one looks at the documents that professionals cite, one finds that their choices tend to conform to their own main topics. For example, writers on relevance such as Barry, Harter, Schamber, Swanson, and the present author frequently cite other writings on relevance.

This account bears as well on surrogate judges’ *disagreements* about topical relevance. Judges, like users, may be swayed by implicit criteria that go beyond topicality in the strict sense. Even with only a citation plus abstract, a judge might declare a document relevant to a request because, for instance, she makes a connection not readily apparent to others or lets the name of an author or journal tip the scales in the document’s favor. The judge here is acting creatively, like an end user (although not necessarily as a real user would), and disagrees with judges who are more literal-minded. When the inferences behind such creativity are hidden, judgments seem bewilderingly subjective. In the language of RT, undercommunicated chains of reasoning increase others’ processing effort, which makes claims of relevance based on them problematical.

Courts of law have a procedure for standoffs like this: a lawyer who, in arguing a case, is charged with irrelevance by opposing counsel (“Objection, Your Honor!”) must clarify his or her reasoning to the satisfaction of the court. IR evaluation trials being less grave, differences are seldom ironed out so that relevance judgments reach a higher level of intersubjective agreement. If judges in retrieval tests could be induced to reveal the logic by which they reached controversial conclusions on relevance, their assumptions—including possible mistakes—*could* be objectively evaluated, and this would dispel the mystery of disagreements. (This resembles getting coders in content analysis to resolve their differences so as to improve intercoder reliability.) But time and energy are too short for such additional labor to be likely.

OBJECTIFYING SUBJECTIVITY

The RT formula permits a new approach to the vexed question of whether there are two kinds of relevance, objective and subjective, in IS. Following RT, we may want to dispense with the objective/subjective split altogether and simply conclude that people differ in the assumptions they bring to documents, which affects their processing effort, which affects the cognitive effects the documents have.

To say that something is RT-relevant implies that its cognitive effects were not zero. Communications that produce no effect—no change in one’s assumptions—are irrelevant even though the effort to process them may be very low (e.g., weather reports from most places on earth). Communications may also produce no effect and hence be irrelevant because the effort required to process them is too high (e.g., for many persons, mathematical models of weather patterns).

In both cases, a person’s mind is always the context in which communications are evaluated and effects occur. People differ widely in the cognitive contexts they embody (e.g., for some, mathematical models of weather patterns are child’s play). But they do not differ on *kinds* of relevance, objective versus subjective, they perceive within these contexts. As their powers of inference operate, they simply experience a communication’s greater or lesser cognitive effects. In that sense, perceived relevance is unitary. It does not require switches between, say, one capability that knows a question has been answered, a second that realizes a line in a play is funny, a third that takes “I want a divorce” more seriously than “I want a snack,” and a fourth that sees a hitherto unseen connection between two documents or between a document and a request.

What does seem to vary across people, given the cognitive context each sets, is processing effort. Some communications are relatively easy for many people to process. They produce cognitive effects with little need for explanations

or new thought. Many communications called “objectively relevant” in IS would seem to be of this sort. It is not that they are necessarily popular in content, like sitcom dialog. It is that most people can follow their underlying logic by using the same inferential abilities they bring to content of all kinds. By this line of reasoning, “subjective” relevance in IS may mean no more than “as yet obscure, as yet hard to follow.”

The notion of subjective relevance has two main uses in IS, both having to do with topical relevance. First, it is invoked in IR tests when surrogate judges *disagree* on whether a document matches a topical request. (Their agreements are taken as signs of objective relevance.) Second, it is invoked when actual end users (the persons who put the requests) use criteria *in addition to* topical relevance in judging documents, because no topical statement can capture the full, dynamic complexity of their information needs. Such end users might *agree* that a document matches the topic of their requests, yet still reject it on other grounds often called subjective.

Swanson and other information scientists treat subjective relevance as if it results from a flash of insight during an IR experiment—a moment of creativity that then remains mysterious. It is true that judges in IR tests usually score documents without explanation, so that, if they go beyond topic matching, their reasons are hidden from others. But such tests are too artificial to be a suitable base for a general psychology of information needs and uses. In life, a person who wants credit for linking topics across documents cannot leave the linkage unexplained. What started as subjective creativity—unique cognitive effects—must be communicated so that others can understand it. It must be recontextualized from private to public—more plainly, explained by writing and citing. As a result, it moves toward objective relevance, or at least much higher intersubjectivity.

This is not to say that claims of relevance will always be convincing. When explained under standards of criticism, they may turn out to be feeble or wrong. Rather, it is to say that the “subjectivity” of relevance judgments has roots in the way IR tests are administered: researchers want to avoid saddling judges with processing effort beyond filling out simple forms. The whole subjective-objective muddle in IS results from attempts to derive user psychology from the narrow world of Cranfield-style evaluation, where relevance judgments typically have little explanatory context.

If, moreover, end users are the only ones whose judgments should count, why not ask them what they *did* with the citations plus abstracts in some period after a search? For example, was an item obtained in full-text? Was it filed but never looked at? Was it read? Assigned to students? Cited in the preparation of a new work? Surveys of this sort would replace users’ subjective judgments with reasonably objective behavioral measures. (Their original hit-lists might be quite altered in the process.)

Judy Bateman^[34] and Peiling Wang^[35] have initiated research along these lines that would seem to offer a more valid account of the retrieval-worthiness of documents than the snap judgments of IR tests. But longitudinal studies go contrary to the ethos of the Cranfield tradition, where, to this day, the emphasis is on getting quick counts for the various evaluation ratios.

While purists may want to reserve the term “objective relevance” for relations of logical entailment,^[13] that seems overfastidious in the messy world of IS. There are relations other than entailment that are admissible as instances of relevance—for example, the relations of analogy or illustration or historical continuity. In any case, what Swanson and others in IS call “subjective relevance” can be taken as a set of effects that are temporarily hard for others to process because their justification has not yet been shared. For example, since one of Swanson’s favorite philosophers, Karl Popper, never wrote specifically on IR, the bare assertion that he is relevant to IR would puzzle the uninitiated. Yet readers can easily see Popper’s relevance once they read Swanson’s bridging accounts (p. 138).^[32] Popper has also been adapted and cited by other information scientists, which heightens the sense of intersubjectivity with Swanson.

RELEVANCE AND CITATION

As we have seen, Swanson and Harter are leading underminers of topical relevance as the sole basis for evaluating IR systems. Swanson’s claim that end users create relevance across topics is elaborated at length by Harter,^[22] who shows how nine IS papers not strictly on his stated interest (which is “empirical research on how people do online searches”) can in fact be brought to bear on it through theoretical conjectures. “Thus,” Harter writes (p. 612),^[22] “we come to the perhaps surprising conclusion that, in IR, *references on the topic may be less important than relevant references not on the topic*—references that allow the making of new intellectual connections or cause other cognitive change” (italics his).

We come also to a practical question: how does one search for relevant references not on the topic? How, for instance, did Harter find his nine stimulating papers? Using the standard noun-phrases of topical retrieval, neither he nor anyone else can frame the idea, *items not on the topic but relevant to it*. Granted, if he had already guessed that online search behavior might be related to another topic, he could search on the latter. But that strategy is likely to produce few hits (or far too many). The most probable assumption is that Harter did not assemble the nine papers through deliberate search; they had simply found their way into his personal collection from various sources over the years, and now he was able to exploit them. In other words, he was putting the fruits of long-term berrypicking to new use.

Could Cranfield-style tests be replaced by the berry-picking model as a means of evaluating IR systems? The latter is certainly a more realistic model of human–literature interactions. On reflection, however, they could not. Berry-picking includes, but is more complex than, literature searches by topic and so is incommensurable with them.

Harter discusses another possibility (p. 614).^[22] That is for information scientists to link theorizing on relevance to citation analysis. Citations are to relevance judgments what fossils are to paleontology—objective evidence of what has gone before—and the prose around them feeds interpretations of their functions and of citer motives. Several studies reveal that writings tied to a document through citation have little overlap with writings tied to the same document through subject indexing. These studies confirm, with data from end users rather than surrogate judges, that relevance relations go beyond topicality. Citation indexes in fact answer the question asked above: how does one search for relevant references not on the topic? Google Scholar, Scopus, and the Web of Science allow this by enabling a searcher to retrieve later documents that cite an earlier one for *any* reason, whether they match it in topic or not. According to White’s nonexhaustive list of reasons (p. 595),^[30] a citer might cite an earlier document to recognize topical similarity, but also to point out an analogy, establish a causal connection, acknowledge use of a research method, provide evidence or examples, borrow rhetoric, or discuss terminology.

So, why not base evaluation of IR systems on some form of citation data rather than judges’ opinions? Actually, Cleverdon, Mills, and Keen in England and Gerard Salton in America did experiment with citation links, as opposed to subject headings, in their project (pp. 106–112).^[36] But they used straight citation matches (e.g., bibliographic coupling) without embellishment. To go further requires additional processing effort. Citations do not come tagged with the metadata needed for more refined IR evaluations. For instance, they lack labels such as “provided an analogy” “provided historical background,” or “provided a method.” This deficiency was noted by (among others) Swanson (p. 145):^[32] “[W]hat is lacking in present systems is any convenient and rapid method for discovering the *nature* of the relevance link which the citing author has established. This can be discerned only by studying the citing article” (*italics his*).

Interestingly, the five-point Cranfield scale shown in Table 2 was a bit of early citation analysis, though not billed as such. It called for citers to rank the relevance of their own citations to particular research questions—in Swanson’s phrase, “to show the *nature* of the relevance link.” Quotes from those citers indicate they thought the task difficult (pp. 29–31).^[36] The Cranfield project took place more than 40 years ago, yet little has changed today. It is utopian to think that citers will ever enrich their citations with metadata, as proposed by Swanson (pp.

145–146),^[32] among others. Several bibliometricians have added metadata to others’ citations by hand, in the style of old-fashioned content analysis, but that is very slow. The best hope lies in *automated* enrichment of citations with explicit pieces of language around them, such as tagging citations in a scientific paper with the headings of sections in which they occur. For example, one would expect citations from *Methodology* sections to refer to methods papers, but citations from *Introduction* sections to refer to earlier substantive findings or theory. As data increased over time, citations would come to be typified by their tags, and this information depending on the nature of the relevance links could be exploited to increase the precision of retrievals in citation databases. Experimental analysis of full-texts along these lines is ongoing.^[37]

CONCLUSION

Writers on relevance in IS often observe that the concept is not well understood and call for further research to clarify and ultimately measure it. The conclusions here are that, on the contrary, we understand relevance quite well (thanks in part to explications such as those cited here), and that it will always be measured only crudely (ordinally at best, according to Sperber and Wilson). What is relevance in IS? In an RT-flavored sentence, it is the ability of a document to produce in the mind of a user *valuable cognitive effects without undue processing effort*. This way of putting it can be made compatible with the definitions of Rebecca Green and Patrick Wilson in the first paragraph and with those of many other information scientists. The debates of the past seem increasingly passé.

The Cranfield tradition of evaluation lives on—for example, in the TREC competitions—but it is hard to believe such tests will dramatically improve IR systems, at least during the shelf-life of this *Encyclopedia*. The early researchers in IR assumed that systems could and should be designed to serve demanding people with fixed information needs, expressed through well-chosen noun phrases. Hence the idea of the IR system as a fine-tuned robot—one that applied the best algorithms to the best indexing so as to deliver all relevant documents in a collection and only those. That idea died long ago. In its place, we have systems that simply recommend more or less plausible items and facilitate exploration by trial and error. They work because people are so adept at creating relevance as they go, especially by intuitive manipulations of their own processing effort.

Undeniably, current systems such as Google need improvement, but it is not likely to come about through tests of recall and precision. One evident need is for better disambiguation of search terms. Systems in which natural language has replaced controlled vocabulary produce countless “false drops”—false not in nuance but in major differences of sense. For example, Google at present

cannot tell whether the phrase “shoulder of mutton” means a cut of meat or an English pub. (Human beings can almost always tell from the context.) A few search engines do cluster their retrievals by sense (on the basis of words that frequently co-occur with the search term). They can separate, for example, recipes for meat dishes from ads for pubs, so that requesters can choose the cluster they meant rather than having to scroll through a long mixture of items. But Google and Yahoo, to name only the giants as of 2008, lack that ability. To say they need better precision ratios is a roundabout way of stating the obvious. They need the ability to detect various search-term senses and group documents accordingly. Less effort means greater relevance for users.

As a provocation, however, suppose that the future brings *no* improvements in IR systems—that we simply cope with what we have today. There is no reason to think human communication would suffer much. People have always had ways of compensating for the defects in their literature-based answering systems. For example, designers of computerized IR systems have probably never relied on their own systems to find most of what they themselves read and cite. They berrypick. Their friends and assistants hand them things. Rumor has it that Stephen Harter came across Sperber and Wilson’s *Relevance* while browsing in an airport bookstore. Even if that is biographically false, it is true as a parable. No one can complain that, because systems do not find all relevant documents, or only relevant documents, too little of value is written.

Relevance Judgments and Measurements

Erica Cosijn

Department of Information Science, University of Pretoria, Pretoria, South Africa

Abstract

Users intuitively know which documents are relevant when they see them. Formal relevance assessment, however, is a complex issue. In this entry relevance assessment are described both from a human perspective and a systems perspective. Humans *judge* relevance in terms of the relation between the documents retrieved and the way in which these documents are understood and used. This is a subjective and personal judgment and is called *user relevance*. Systems compute a function between the query and the document features that the systems builders believe will cause documents to be ranked by the likelihood that a user will find the documents relevant. This is an objective *measurement* of relevance in terms of relations between the query and the documents retrieved—this is called *system relevance* (or sometimes similarity).

INTRODUCTION

One of the main objectives of information science as a discipline is to retrieve relevant information, and as such the concept of relevance is regarded as a central notion in the field. The concept of relevance has changed substantially over the years and it is now realized that relevance implies a relation, has many dimensions, various manifestations, can either be judged in absolute or relative terms, is dynamic, and is very difficult to define.

The idea of quantifying relevance is a very complex issue, and one that has been studied for many years with varying degrees of success. A user very often intuitively knows whether a retrieved document is relevant or not and relevance is mostly understood in the fuzzy sense of “I will know it if I see it.” On the other hand, an information retrieval system (IRS) may confidently rate a document as 100% relevant to the query used to retrieve it, while the user does not judge it as relevant at all.

It is already clear that there are at various interpretations of the term “relevance.” In systems approaches to information retrieval (IR), relevance is considered to be a property of the relation between the content of the document and the system’s search criteria. In user-oriented and cognitive approaches to IR, relevance has to do with the cognitive processes of the users and their changing knowledge and needs regarding information, within or stimulated by the context.^[1] Context hence implies the socio-organizational environment as well as the systems and information objects involved and surrounding the actual user.

It is widely accepted that IR comprises three elements or role players—systems, users, and the environment.

- The system involves documents or information objects (represented in various ways), which are then

organized in some way and, through a given algorithm, prepared for matching a query via an interface mechanism.

- The user typically has a problem to solve, a work task to perform, or an interest to satisfy, and a derived information need which has to be apparent to a certain degree to the user. For example, it might be verbalized before it can be transformed into a query that is acceptable to the system algorithm.
- The socio-organizational environment provides the context or situational framework influencing the activities of the user. This can include anything from the definition of the work task, to the choice of retrieval system, the type of information available, etc.

The process of information seeking and retrieval clearly consists of many aspects that may influence the role players, the steps followed to find and use information and the iterations of the processes as various circumstances change over time (e.g., the manner in which the user understands the problem, the work task, the situation). Perhaps the easiest way to understand the complexity of the process is by means of the following example: A chef works at an embassy and receives notice that he/she has to prepare a dish for a dinner meeting where an important trade agreement might be signed. The chef identifies keywords and selects an appropriate database to look for a suitable recipe. In this scenario, the following role players may be identified:

- The chef is the *human user*.
- The preparation of the dish is the *work task*.
- The meeting is the *situation* for which the information retrieved will be utilized.
- The embassy and the guests at the meeting are the user’s *socio-organizational environment*.

- The database and search engine is the *IRS*.
- The keywords combined by logical operators is the *query* that is input into the IRS.
- The recipe is the *document* that will be retrieved.

Once the user realizes that his/her state of knowledge is incomplete and decides that an IRS has to be used to find documents that will satisfy the information need, the process of information seeking and retrieval starts and typically consists of the following stages:

- A question (in natural language) has to be reformulated as a query to be input into the IRS.
- Documents are retrieved, measured, and ranked according to relevance by the IRS.
- The relevance of the documents are then judged by the human user in terms of his/her own cognition, in terms of the work task that has to be executed, in terms of this situation for which the information is to be utilized, and also within the socio-organizational environment in which the information is presented (in the latter case not necessarily by the user himself/herself).
- Depending on a variety of factors, the documents that were retrieved are then either rejected or used.
- The entire process of seeking and retrieval is iterative—any of the stages may be repeated if the outcome is not satisfactory.

The example illustrates that there are many factors involved when we deal with the issue of relevance. In each of the stages from the definition of the work task to the outcome of the meeting, relevance was measured or judged.

Whether relevance is measured objectively by an IRS or subjectively judged by a human user, ultimately it is a *relation* that has to be evaluated. Mizzaro^[2,3] stated that relevance may be viewed in terms of a relation between two groups of entities:

- The first group of entities deals with the information and information objects as such—documents, document surrogates, or the information which the user perceives when reading the document or surrogate.
- The second group of entities deals with the work task (the problem that has to be solved, the task that has to be fulfilled, or the interest that has to be satisfied), the information need resulting from the work task (this is a representation of the problem in the mind of a user), the request that is formulated on the basis of the information need (a representation of the information need in human language), and the query (a representation of the information need in a format that can be processed by an IRS).

Relevance can be viewed as a relation between any of two entities, one from each group. Each of these entities may

be divided further into three components: *topic* (subject area), *task* (activity that will be executed when documents are retrieved), and *context* (other factors, excluding topic and task that will influence the information behavior).

In addition to these components within the relationships, there is yet another dimension, namely that of time. The information-seeking situation takes place over time and the user's cognition of his/her work task changes over time. An overview document that was highly relevant at the beginning of a research project (perhaps because the user did not understand the problem) may no longer be relevant at the end of the project, because the user then knows the background, and that same document is then viewed as too elementary. The same argument goes for a user whose problem has changed over a period of time.

Mizzaro^[2] also discusses the issue of “who judges what?” and this can happen in any of the following five dimensions: the kind of relevance judged; the kind of judge (user or nonuser); the physical entity the judge can use (document, surrogate, information) for making his/her relevance judgment; what the judge can use (query, request, information need, or problem) for expressing his/her information need; and the time at which the judgment is expressed.

For the purpose of this entry we will make a distinction between *relevance judgments* and *relevance measurements* (these should not be read as formal definitions of the terms):

- *Relevance judgments* can be seen as a subjective process where the human user decides on the relevance of retrieved documents in relation to the work task that he/she has to fulfill. Humans judge the relevance of information objects in terms of a variety of factors, some of which are very subjective and individualized. Furthermore, it is acknowledged that as a user's cognition changes over time, his/her judgment of relevance (even of the same documents) also changes. This is called *user relevance*.
- *Relevance measurement* is an objective method where the process of retrieval can be quantified in terms of its outcome. The term measurement implies objective criteria, physical entities, and quantification. When a query is entered into an IRS, the user is presented with a ranked or sorted list of documents. These documents are those that have been assessed as relevant based on the degree of similarity between the query and the documents. This is an objective measurement of relevance and is called *system relevance*, sometimes also called *similarity*.

RELEVANCE JUDGMENTS

The judgment of the relevance of a document is the evaluation of a relation. These relations are always between

the document (or information object) on the one hand and some aspect of the seeking process on the other—for example the request, the information need, the underlying situation. Furthermore, these relations change over time.

User Relevance Criteria

Longitudinal studies show that users have a wide variety of factors that can affect judgments of the relevance of an information object. Two of the major longitudinal studies where responses were elicited from the users themselves are those by Barry and Schamber^[4] and Vakkari and Hakala.^[5]

Barry and Schamber^[4] combined the results of two separate studies on relevance criteria in order to establish whether there is a “finite array” of user relevance criteria. The result of the study indicated that this array does indeed exist and is also finite, and that it is applied consistently across types of information users, problem situations, and source environments. The list below shows the criteria by which users judge the relevance of information objects:

- Depth/Scope/Specificity: Focused, specific to user’s needs, sufficient detail or depth, interpretation, etc.
- Accuracy/Validity: Accuracy, correctness, and validity of information.
- Clarity: Presentation of information in a clear or well-organized manner.
- Currency: Current, recent, up-to-date, timely.
- Tangibility: Extent to which information relates to real, tangible issues, proven information, hard data, actual numbers.
- Quality of sources: General standards of quality, reliability.
- Accessibility: Effort and costs.
- Availability: Availability of information/sources of information.
- Verification: Consistent with or supported by other information in the field. Agreement with the user’s point of view.
- Affectiveness: Affective or emotional response to information (e.g., pleasure, enjoyment, or entertainment).
- Effectiveness: The extent to which a procedure that is presented is effective or successful.
- Consensus within the field: Consensus or agreement in the field relating to the information being evaluated.
- Time constraints: Whether time constraints or deadlines are a factor in deciding to pursue information.
- Relationship with author: User’s personal or professional relationship with author.
- Background/experience and ability to understand: User’s background and experience helps to judge quality, reliability, or understanding of the issues.

- Novelty: Document novelty, source novelty, and content novelty.
- Geographic proximity: Geographic location covered in document may not be relevant to user’s situation.
- Dynamism: Presentation of information: live or dynamic. Can user manipulate the presentation of information.
- Presentation quality (excluding entertainment value): Format or style of presentation.

The aim of the Vakkari and Hakala^[5] study was to analyze how changes in relevance criteria are related to changes in the problem stages during task performance processes and it was concluded that the user’s relevance criteria are (partially) dependent on the stage of the task performance process. The list below shows the relevance criteria users identified, and the subcategories of each criterion:

- Information content: topicality, point of view, recency, discipline, geographical area, references, examples, clarity, research approach.
- Sources of documents: person’s relation to sources, source type, author.
- Document as physical entity: availability, length.
- User’s situation: time constraints, stage of the process.
- User’s experience and preferences: ability to understand, language, interest, novelty, saturation.
- Information types: general information, specific information, theories, methods, empirical results.

From the two studies above it is clear that users judge the relevance of an information object on much more than simply the relationship between the query and the documents—the manner in which systems measure relevance. It would seem that in some cases, users do not even take the content of the document into account when they judge the relevance of these—there are many other factors that play a role.

Subjective Relevance Types

In 1996 Saracevic (and expanded in 2007)^[6–8] produced a stratified model that deals specifically and comprehensively with interactive communicative aspects of interactive IR. The model described five increasingly subjective types of relevance:

- Algorithmic relevance is objectively measured through an algorithm and results in a sorted or ranked list of documents. These objective measurements will be described in the next section.
- Topicality or topical relevance is the assessment of the aboutness of the query as compared to the aboutness of a document.

- Cognitive relevance or pertinence is the judgment of the content of the information object and the information need as perceived by the user at a given point in time.
- Situational relevance is the judgment of the document in terms of the work task situation as perceived by the user.
- Motivational or affective relevance is an emotional or intentional type of judgment that is highly individualized.

It was argued by Cosijn and Ingwersen^[9] that this emotional/intentional type of relevance is included in all the subjective relevance types. They also argue that another type of relevance should be defined, namely:

- Socio-cognitive relevance that refers to domain, context, and collective situational preferences.

Each of the subjective relevance types will be discussed in more detail below, with specific reference to what relations are evaluated and how the measurement or judgment is made. The example used in the introductory section will also be used to illustrate the complexity of the subjective relevance judgments.

Topical relevance judgments

When a user has a work task to fulfill and realizes that he/she has to use an IRS to find information, he/she first has to find the focus of the problem. The information need is typically verbalized, but this “question” has to be reformulated as a query in order to be processed by an IRS. If we return to the example of the chef in the introduction, the information need is the need for a recipe that fulfils the requirements of the situation. In order to find a recipe, the chef has to identify appropriate search terms, combine them with logical operators, input this query into an IRS, and retrieve a set of information objects.

Topical relevance may be defined as the relation between the *topic* of the query and the *topic* of the retrieved information objects, and is assessed in terms of the aboutness of the information objects. If the chef used the query “lobster AND fish,” he/she might retrieve several documents: some are recipes having lobster and fish as ingredients; others are recipes having lobster and fish only as terms in the description of the recipe (e.g., a novelty birthday cake in the shape of an aquarium). In this case, only the first group of recipes will be relevant in terms of the topic of the query (being ingredients in a recipe) and the topic on the retrieved information objects.

The assumption is that both query and the objects may be assessed by a cognitive agent as being about the same or a similar topic. This assumption implies a degree of subjectivity on the user side. The subjectivity is

compounded if the information objects are represented by human-indexed terms.

Pertinence or Cognitive Relevance Judgments

Pertinence is measured in terms of the relation between the state of knowledge, or cognitive information need of the user, and the information objects as interpreted by that user. The criteria by which pertinence are inferred are cognitive correspondence, informativeness, authorship, information preferences, currency, and adequacy of form. For instance, a paper may be topically relevant but repeating what the user already knows. In the example of the chef now having retrieved several recipes with “lobster” and “fish” as ingredients, and having judged this subset of documents relevant on a topical level, it may be that he/she already has knowledge of some of these recipes, but for some reason did not deem these as relevant to the task at hand. Other recipes are new to him/her, and these are judged as pertinent (or cognitively relevant).

In the case of an intrinsically ill-defined information need at a given point in time, the user may not be able to assess pertinence.^[10] One may say that if the user has insufficient knowledge and does not have a good grasp of the structure of the task, he/she will not have the necessary cognition to understand the problem. Cognitive relevance can therefore be described as the ability to connect a task to prior knowledge.^[5]

This type of relevance is also extensively described by Barry^[11] during an empirical study to define the criteria mentioned in users’ evaluations of the information within documents as it is related to their need situations. The study showed that users included tangible features as well as subjective qualities, together with affective and situational factors.

Situational relevance judgments

Situational relevance^[12,13] describes the relationship between the perceived situation, work task, or problem at hand and the usefulness of the information objects as perceived by the user. The criteria by which situational relevance is inferred are usefulness in decision-making, appropriateness of information in problem solving, and the reduction of uncertainty. In the example of the chef, he/she now has a subset of recipes which are topically as well as cognitively relevant. From this subset of documents the chef has to assess each in terms of suitability within the situation (a very important dinner where a trade agreement is dependent on the outcome). Unusual recipes, both looking and tasting good, may be judged as situationally relevant.

The judgment of situational relevance is deemed not only the evaluation by a user of whether a given information object is capable of satisfying the information need. It offers the additional potential of creating new knowledge

which may motivate change in the decision maker's cognitive structures. In turn, this change may lead to a modification of the perception of the situation and the succeeding relevance judgment, and in an update of the information need.^[14]

Socio-cognitive relevance judgments

Socio-cognitive relevance describes the relationship between the situation, the work task or problem at hand in a given socio-cultural context on the one hand, and the information objects on the other, as perceived by one or more cognitive agents. The social or organizational domain, or cultural context in which the individual finds himself is defined by a paradigm or tradition, which dictates what problem explanations may be found to be acceptable.

The relevance judgments within a particular context are not necessarily made by the user of the information objects. Returning to the example of the chef, we can summarize the process of finding and using relevant information as follows: the user has an information need derived from a particular context. The user perceives the work task in a certain way, states his/her information need, formulates a suitable request, translates the request into a query, inputs the query into an IRS, and retrieves a set of information objects which are measured as relevant by the system (algorithmic or system relevance measurement). The user judges the set of retrieved documents firstly on a topical level (topical relevance judgment) and then within his/her own knowledge of the topic (pertinence or cognitive relevance judgment). The user then decides whether the use of these documents will be suitable within a particular situation (situational relevance judgment). However, the result of this process will ultimately be judged, not by the chef, but by the dinner guests and the outcome of the dinner. If the trade agreement was signed, the documents were relevant, but if the chef was not aware that some of the key guests were vegetarians (thereby adversely affecting the attitude of these guests by serving fish) and the agreement was thus not signed, then the documents were not relevant within the context (socio-cognitive relevance judgment).

Affective relevance

Affective relevance is described in terms of the relation between the goals, intents, and motivations of the user and the information objects. Affective relevance should not be seen as the ultimate subjective relevance in a scale of relevances, but rather as another dimension of relevance judgments that may be associated with the other subjective types of relevance. A user may, for example, decline to use a document that is judged as topically, cognitively, as well as situationally relevant because it goes against his/her moral principles.

Based on the discussion above, it is clear that when a user judges the relevance of a document (or other information object) there are many factors at play. Some of these factors can be relatively objective (e.g., whether the document is dealing with the right topic or not), and some are very subjective, personal, or even emotional.

Algorithmic relevance

Algorithmic relevance as defined by Saracevic^[6] is another synonym for system relevance or similarity. This type of relevance is objectively measured through an algorithm and results in a sorted or ranked list of documents. The following example once again illustrates the difference between system relevance and user relevance. When two users use a particular IRS and input identical queries, they will retrieve identical sets of documents. This is because system relevance is a computed similarity function and as such is an objective measurement as opposed to the subjective judgments, i.e., user relevance. Once these two users have retrieved a set of (systemically) relevant documents from an IRS, they can peruse the documents and know whether a particular document is relevant or not in terms of their own information needs. These two different users may have exactly the same work task (e.g., a class assignment) to fulfill and yet one may judge a particular document relevant while the other may not (perhaps because she already knows the content of that particular document). The complexities of the process of user relevance judgments of information objects have been discussed above. The next section will deal with various aspects of system relevance measurements.

RELEVANCE MEASUREMENTS

System or algorithmic relevance is measured in terms of the comparative effectiveness of logical or statistical similarity of features inferring relevance.^[6] This is system-oriented to a very large extent, as it depends on the degree of similarity between the features of the *query* and the features of the *document*. It is not influenced by the user, nor is it related to any subjective information need the user may have.

Historically, research into the evaluation and improvement of system relevance relied largely on the so-called laboratory model of information retrieval. In the laboratory model there is a test collection (a database of documents), a well-defined set of topical queries and a set of relevance assessments to identify the documents that are topically relevant to the query. The assessments are often (but not always) binary in nature. The results of the assessments are then usually expressed in terms of precision and average recall (see discussion below).

Recently, however, the laboratory model has been challenged by developments in research on relevance and

information seeking. One of the main thrusts in this line of research is the importance of user interaction and involvement during the retrieval process and assessment of the retrieved documents in terms of subjective information needs. For a comprehensive discussion of these issues see Ingwersen and Järvelin.^[12] This section deals mainly with assessment of system relevance within the laboratory model, but ends with a recommendation that the laboratory model be reviewed and extended to also include users and their context.

The laboratory model has its origins in the so-called Cranfield experiments (1957–1968) by Cyril Cleverdon et al.^[15] These experiments entailed comparing several alternative indexing languages. The results of the performance of the different indexing languages were quantified in terms of precision and recall—evaluation measures that calculate the proportion of retrieved documents that are relevant (precision) and the proportion of relevant documents that are retrieved (recall).

In a closed system such as this, we can then use a matrix to evaluate the retrieval of documents in relation to a query:

	Retrieved	Not retrieved	
Relevant	a	b	$n_1 = a + b$
Not relevant	c	d	$n_2 = a + c$
	$N = a + b + c + d$		

documents that are relevant:

$$P = \frac{a}{(a + c)} = \frac{a}{n_2}$$

Precision can alternatively be defined as

$$P = \frac{|\{\text{relevant documents}\} \cap \{\text{document srtreived}\}|}{|\{\text{document srtreived}\}|}$$

Recall (R) is defined as the proportion of relevant documents that are retrieved:

$$R = \frac{a}{(a + b)} = \frac{a}{n_1}$$

Recall can alternatively be defined as

$$R = \frac{|\{\text{relevant documents}\} \cap \{\text{document srtreived}\}|}{|\{\text{relevant documents}\}|}$$

Both precision and recall have a maximum value of 1 and a minimum value of 0.

For each query that is submitted to an IRS, a precision-recall value can be calculated. Each precision-recall value is denoted by an ordered pair (P_n, R_n) where P denotes

Fig. 1 The precision-recall graphs for two separate queries.

precision; R denotes recall and n a parameter (e.g., rank position). A graph can be plotted (see Fig.1) utilizing the set of ordered pairs for a particular query. In practice and on average, the relationship between precision and recall tends to be inversely proportional—as recall increases, precision will tend to decrease, and vice versa.

Other measures related to precision and recall are fall-out and generality:

Fallout (F) measures how well an IRS filters out nonrelevant documents during the retrieval process and is defined as the proportion of nonrelevant documents that are retrieved:

$$F = \frac{c}{c + d} = \frac{c}{N - n_1}$$

Generality (G) is the proportion of relevant documents within the entire collection:

$$G = \frac{a + b}{(a + b + c + d)} = \frac{n_1}{N}$$

The relative performance of an IRS may be expressed in terms of the measures above:

$$\frac{R}{F} = \frac{P/(1 - P)}{G/(1 - G)}$$

It should be noted that fallout and generality are not used anymore as measures of retrieval system effectiveness in the context of test collections. Fallout is not used because it is generally uninformative. In a collection of any reasonable size the vast majority of the document collection

is not relevant to a particular query and thus almost none of the nonrelevant documents are retrieved (even by systems that are grossly ineffective). Generality is not used because test collections can only be used to compare systems' performance on that given collection, and generality is a constant across systems for a particular collection.

There are many problems related to using recall and precision as a measure of retrieval effectiveness (for a more detailed discussion, see Korfhage^[16] and Baeza-Yates and Ribeiro-Neto^[17]:

- In a closed test collection, both recall and precision can be calculated with some accuracy. In a real-world situation, however, recall cannot be determined, since this would require knowledge of all the documents in the collection.
- Although precision and recall are related to each other, each in isolation does not give a good indication of retrieval effectiveness.

An alternative measure combining precision and recall into a single measure is the Harmonic Mean.^[17]

The *Harmonic Mean* (F) of recall and precision is calculated as

$$F = \frac{2 \times (\text{Recall} \times \text{Precision})}{\text{Recall} + \text{Precision}}$$

This is also called the F_1 measure, since recall and precision are evenly weighted. The generalized F-measure is defined as

$$F_\beta = \frac{(1 + \beta^2) \times (\text{Precision} \times \text{Recall})}{(\beta^2 \times \text{Precision}) + \text{Recall}}$$

where F_β “measures the effectiveness of retrieval with respect to a user who attaches β times as much importance to recall as precision.”^[18] The F_2 measure thus weights recall twice as much as precision, while the $F_{0.5}$ measure weights precision twice as much as recall.

Precision and recall are based on the entire set of documents retrieved by the system related to a query. The *Mean Average Precision* (MAP) (also referred to as the mean non-interpolated average precision) is a mean calculated over a set of queries. The average precision is calculated after every retrieved relevant document (zero is used as the precision for not-retrieved relevant documents). The average precision is then calculated over the total number of relevant documents retrieved for a query:^[19]

$$\text{AveP} = \frac{\sum_{r=1}^N (P(r) \times \text{rel}(r))}{\text{Number of relevant documents}}$$

where r is the rank, N the number of documents retrieved, $\text{rel}()$ a binary function on the relevance of a given rank, and $P()$ precision at a given cut-off rank.

In an ordered list of retrieved documents, the *bpref measure* (binary preference) measures the number of faulty orderings (e.g., where a nonrelevant document is ranked before a relevant document):^[19]

$$\text{bpref} = \frac{1}{\text{ard}} \sum_{r=1}^{\text{ard}} \left(1 - \frac{\text{nn}_r}{\text{nn}}\right)$$

where nn_r is the number of nonrelevant documents in the results list up to the position of the r th relevant document, nn is the number of nonrelevant documents in the results list, and ard is the number of relevant documents in the results list.

Laboratory experiments related to relevance measurements have also started to change from predominantly using binary relevance assessments to using graded relevance assessments by means of N -ary measures (e.g., a three-point scale: not relevant, partially relevant, relevant or a four point scale: not relevant, marginally relevant, fairly relevant, highly relevant). A higher value for N will increase expressiveness of assessment, but will decrease the consistency of assessments.

Normalized Discounted Cumulative Gain (NDCG) is a relatively new measure that utilizes multipoint scales (as opposed to binary). This means that a particular document “gains” according to the level of relevance. The overall utility of N documents are measured by the sum of the gain of each relevant document (“cumulative”). The gain of a low-ranked document is “discounted” so that a highly ranked document will count more toward the gain. “Normalized” means that an ideal ranking is used to calculate an upper limit and the actual gain value is then normalized against this limit.^[20]

In the measurements described in the section above, relevance is a function of the system—the absolute relationship between the query and the document is measured. The assumptions are that relevance depends on static topical similarity and that relevance is a binary (or at least based on discrete values) assessment. It does not take into account that different users may have different cognitive interpretations and information needs.

The process of user relevance judgment starts when the user is confronted with a set of documents for use in the work task. This set of documents (or other information objects) might be a set retrieved through an IRS and was defined as (systemically) relevant, it might be a set of documents gathered through manual effort, or it might even be a set of documents supplied by an intermediary. At this stage, it is dependent on the user to judge the relevance of these documents in terms of his/her own information needs. If the documents were retrieved through an IRS, the relevance of the retrieved set has been

measured objectively as a relationship between the query and the documents retrieved. Once the user starts perusing the documents, their relevance is judged in different terms. User relevance is subjective and individualized, based on a variety of factors.

This multidimensionality of relevance would suggest that the computing of system relevance is but one aspect of the process of Information Seeking and Retrieval. Ingwersen and Järvelin^[12] argue that the laboratory model of IR evaluation has been challenged due to its lack of realism and proposes two alternative approaches to traditional laboratory model—one is to extend IR research to take the user and his/her context into account, and the other is to extend Information Seeking research toward the context of the task as well as toward the technology.

CONCLUSION

Users know intuitively if a document is relevant or not. The formal assessment of relevance and the associated theory, however, is a much more complex issue. Relevance can be assessed in one of two ways. Relevance can be measured through an algorithm in terms of the relation between the query and the information objects retrieved by the query. When a query is entered into an IRS, the user is presented with a ranked or sorted list of documents. These documents are those that have been assessed as relevant based on the degree of similarity between the query and the documents. This is an objective measurement of relevance, and is not necessarily in agreement with what the user perceives to be relevant.

Humans judge the relevance of information objects in terms of a variety of factors, some of which are very subjective and individualized. Users judge documents in terms of their own perception of the problem or work task, in terms of the complexity of their own situation, in terms of the context that they operate in, as well as other subjective and affective factors which are not always clearly verbalized. Furthermore, it is acknowledged that as the user's cognition changes over time, the judgment of relevance (even of the same documents) also changes.

Renaissance Libraries [ELIS Classic]

Lawrence S. Thompson

University of Kentucky, Lexington, Kentucky, U.S.A.

Abstract

The author surveys the history of libraries during the Renaissance and the Reformation in several European countries.

—*ELIS Classic*, from 1983

INTRODUCTION

To define the Renaissance in broadly acceptable terms or to set limits for its beginning and end and its geographical scope is all but impossible.^[1,2] One aspect, perhaps the central one, is beyond any dispute: The book—its collecting, preservation, reproduction, and exploitation for new ideas—was the key to the break with medieval tradition. While there are early and late manifestations of the spirit of the Renaissance, the role of books and libraries in the revival of learning begins, roughly, in the mid-fourteenth century and may be said to continue into the latter sixteenth century when classical scholarship began to take full advantage of the revival of ancient learning and its application to contemporary culture. The library of the seventeenth century is in a direct continuum from those of the previous two centuries; and, as far as modern libraries are concerned, the institutions we know today took shape in the seventeenth and eighteenth centuries.

The humanists found in the book something permanent, over and above its specific service in perpetuating the traditions of classical antiquity.^[3] Thus, they viewed libraries, the basic tool for preserving books, as the most important servants of scholarship. When Cardinal Bessarion gave 746 manuscripts to the Venetian Republic in 1468, the origin of the Marciana, it was “ad communem hominum utilitatem.”^[4] Time and again, we have expressions of confidence in libraries as the one indispensable tool of scholarship.^[5,6] A legend was created that endures today, sometimes to the detriment of scholarship in the reverence for the printed book, much as the respect for the manuscript affected the acceptance of the printed book in the fifteenth century.

ITALY

Francesco Petrarca (Petrarch; 1304–1374) stands at the head of the roll of Italian humanists.^a He must have been an

impassioned bibliophile at an early age. In 1337, he prepared a list of “libri mei,” and he was well on his way to developing the first great humanistic library. He copied Cicero’s letters, discovered in the Verona Cathedral library in 1345; and after he found a manuscript of Vergil, now in the Ambrosian Library in Milan, he always took it on his extensive travels despite its size. In 1362, Petrarch left Milan on account of an epidemic; he went to Padua and then to Venice, where he made an arrangement to deposit his books in Saint Mark’s. He was in Venice for five years, must have left some books there (a sorry remainder was discovered two and a half centuries later), and then went to Arquà (near Padua), with whose master, Francesco da Carrara, he was acquainted. Petrarch’s will of 1370 does not mention his library, and it has been assumed that most went to Carrara. The latter’s library was seized by the Visconti of Pavia in 1388, and, in 1500, it was taken by Louis XII with other bibliographical booty and shipped to Blois, then removed in 1544 to Fontainebleau. Twenty-six manuscripts from Petrarch’s library are in the Bibliothèque Nationale today, a few others in other places. While Petrarch’s library did not survive intact, it was the prototype of the Renaissance book collection, in the method of acquisition, in content, and in its intended use. His notion about a library in Venice for scholars was an enduring one among later humanists.

If Petrarch or his friend Giovanni Boccaccio had never contributed a line to creative literature, they would still be major personalities of the Italian Renaissance on account of their dedication to collecting books for the revival of learning.^[6,14–16] Boccaccio, unlike Petrarch, had limited means and copied most of the manuscripts he found. His most famous discovery was the Tacitus (*Annales*, XI–XVI, and *Historiae*, I–V) at Monte Cassino, whose library he described in some detail for the neglect it had suffered—possibly an excuse to justify removal of the manuscript.^b The Tacitus manuscript fell into the hands of Niccolò dei Niccoli (1363–1437; *infra*), who allowed

^aOf the extensive Petrarch bibliography, only the following may be noted here. See Ullman.^[7] de Nolhac.^[13]

^bNow Laurentianus 68, II. It also contained the *Agricola*, perhaps more, when the monk Petrus Diaconus used it for his life of Saint Severus about 1135. See Bloch^[17] and Pralle.^[18]

Poggio Bracciolini ("Florentinus," 1380–1459; *infra*) to copy it; and it ended in the Marciana after Niccoli's death. In 1374, Boccaccio wrote a will bequeathing his collection of over 200 volumes to his confessor, the Augustinian Martino da Signa, after whose death it went to the monastery of San Spirito in Florence with the understanding that it be generally available. Niccoli heard about the neglected books and had a cabinet made for them, but after the remodeling of the monastery in 1560, most were lost. Fortunately, we do know titles from an inventory of 107 items preserved in Ashburnham 1897 of the Laurentian Library.^[19] Of these, 10 have been found in the Laurentian and the Riccardiana in Florence, of which 2 were copied in whole or in part by Boccaccio. A third has notes in his hand.

Coluccio Salutati (1331–1406) did not attain the literary renown of Petrarch and Boccaccio, but his services as a manuscript collector are no less significant.^[20–22] He held high civil office in Florence, and his position enabled him to identify and acquire many valuable manuscripts, notably Cicero's *Epistolae ad familiares* (now in the Laurentian) and Cato's *De agricultura*. He had a copy made of the Catullus manuscript in Verona (Petrarch had done it earlier), and he also possessed a Tibullus manuscript (Ambros. R 26 sup.). Salutati did not plan to found a library, but the purchase of his books by Giovanni de' Medici had the same effect.

Petrarch, Boccaccio, Niccoli, and Salutati placed much heavier emphasis on Latin than on Greek literature; but when Antonio Corbinelli (ca. 1370 to 1375–1425) left his collection to the Abbey of Santa Maria in Florence, it included 194 Latin and 79 Greek manuscripts, with 105 Latin and 65 Greek authors.^[23] Many of the latter were not known by the humanists of the time, and there were basic things such as an eleventh-century Thucydides, a manuscript of Sophocles and Euripides (now Cod. Laur. C.S.71), and an *Odyssey* (Cod. Laur. C.S.52).

The most famous of all manuscript collectors of the Renaissance was Poggio, prototype of the book hunter down to the age of Lyman Copeland Draper and Herbert Hoover.^[24] Salutati took Poggio into his service when the latter was barely 20 years old and introduced him to his circle, which included Niccoli. In 1403, Salutati arranged for Poggio to secure a position in the Roman Curia, where he was able to intensify his work in copying manuscripts. His great opportunity came when he went to the Council of Constance as a secretary (1414–1418), even though he lost his job when the first John XXIII lost his. He probably spent much of his time poking around monasteries looking for manuscripts, and he was as shocked by the condition of their collections as Boccaccio was by the situation at Monte Cassino. His most significant discovery was the first known complete text of Quintilian's *Institutio oratoria*. Subsequently, he found other texts, lost up to that time, in monastic libraries of Switzerland, Germany,

and France: notably three and a half books on Valerius Flaccus's *Argonautica*, Asconius Pedanius's commentary of five speeches of Cicero, Lucretius, Silius Italicus, Ammianus Marcellinus, Tacitus, Plautus, Columella, Tertullian, and others. Poggio collected more for others than for himself, since only 95 manuscripts appeared in the inventory taken after his death. His sons and nephew inherited them, but today there are only 5 in the Laurentian, 1 in the Vatican, and 1 in the Riccardiana. But Poggio's service to scholarship in locating, copying, and preserving classical manuscripts will be remembered long after schoolboys stop snickering over his amusing but naughty *Facetiae*.

The concentration of early humanists in Florence and presence of the wealthy and influential family of Medici^[25–30] were decisive elements in making Florence a major cultural center with incomparable art collections and libraries. Cosimo the Elder (1389–1464) established a firm position and a fortune for his family after he became the acknowledged head of the Florentine state in 1434. He established a Platonic academy headed by Marsilio Ficino,^[31] but directly pertinent here is that Niccolò dei Niccoli was his adviser in matters relating to books.^[32] Niccoli collected some 800 volumes, which he wanted to be available to scholars in the Camaldolese monastery of Santa Maria degli Angioli in Florence; but, on account of his debts, he changed this decision shortly before his death and left the disposition of his collection to a committee of 16 fellow humanists. Happily, Cosimo assumed responsibility for these liabilities and acquired 200 manuscripts for his personal collection (*la Medicea privata*); he also placed some 400 in the Dominican monastery of San Marco in 1441 in the handsome hall designed by Michelozzo and still basically intact, the first public library in Italy (*la Medicea pubblica*). The librarian, Giuliano Lapaccini, was allowed to draw on the Medici bank for new acquisitions.

Cosimo also rehabilitated the library of the Abbey of Fiesole (the Badia) and provided it with a corps of copyists under the supervision of Vespasiano da Bisticci (1421–1498), who produced some 200 manuscripts in less than 2 years. Along with the collection placed in San Marco, it is the oldest part of the modern Medicea-Laurenziana. The *Medicea privata* was housed in San Lorenzo and was rather modest until Cosimo's grandson, Lorenzo il Magnifico (1449–1492)^[29,33,34] assumed leadership of the family and of Florence in 1469. Especially constructive was his concern for the acquisition of Greek manuscripts and the effective support of his agent, Andreas Janos Laskaris (ca. 1445–1535), in the Levant.^[35] The library was used by such humanists as Politian, Pico della Mirandola, and Marsilio Ficino. From the expulsion of the Medici in 1494, the library was subject to many vicissitudes (and losses), taken to Rome by Lorenzo's youngest son (Leo X after 1513), and finally returned to Florence by Clement VII (Giulio de' Medici) in 1532.

Clement had commissioned Michelangelo in 1525 to design and construct a library building in the upper cloisters of the basilica of San Lorenzo, but it was not opened until 1571, seven years after Michelangelo's death. The magnificent structure is recognized generally as the finest of all Renaissance library buildings.^c The collection in San Marco (the Marciana) was combined with the Laurenziana in 1808 when monastic property was secularized. The Medicea-Laurenziana has survived wars and political changes, but of its subsequent history, we may note only the acquisition of 1,903 Ashburnham manuscripts in 1885.

When Petrarch left Milan on account of the plague in 1362, he went to Venice, where he gave part of his collection to San Marco in return for personal housing in the Palazzo di Due Torri; but, as we have noted, it did not develop into the public library for scholars that Petrarch probably envisioned. It remained for Basilios Bessarion (1395–1472) of Trebizond—bishop of Nicea and later a Roman cardinal (1439) in the movement for reconciliation—to establish a scholarly library in Venice.^[4] In Italy, with the authority of a cardinal, he collected and copied zealously, and, after the fall of Constantinople (1453), he made a special effort to protect remnants of Greek culture by acquiring manuscripts. His young associate, Niccolò Perotti, who traveled as far as Trebizond, was particularly successful.^[37] Further, his connections with Giovanni Aurispa and Francesco Filelfo, two prominent humanists who had been in Constantinople and acquired manuscripts there, must have been productive.^[38–40] In 1423, Aurispa brought back 238 volumes of Greek classics, including the basic collective volume with the plays of Aeschylus and Sophocles and the *Argonautica* of Apollonius Rhodius.

On May 31, 1468, Bessarion presented his library of 482 Greek and 264 Latin manuscripts of the Republic of Venice.^[4,41] In the humanistic tradition, he expressed, in the document of transmission, his concept of books as the best companions of the scholar. The collection was originally destined for the Benedictine monastery of San Giorgio Maggiore, but San Marco was substituted on May 14, 1468. The library was not adequately housed, and, consequently it was not used to full advantage in the beginning. Finally, in the period 1536–1553, Jacopo Sansovino constructed the magnificent quarters for the library long admired as one of the great architectural achievements of Renaissance Italy.^[42,43] Over the last five centuries, the library has had various homes and made important acquisitions,^[44] but most significant are the tradition of Bessarion and his contributions to the preservation of ancient Greek culture.

Outside of Florence and Venice, there were other col-

lections in princely residences. The Visconti and the Sforza had an impressive library in Pavia, in which 988 manuscripts were recorded in 1426,^[45,46] when the Medici and Niccoli had no comparable collections. But, unlike the Medici, the Visconti and the Sforza and their courtiers had no passion for learning comparable to that of the Medici. Florence and, somewhat later, Venice had stature and influence in Renaissance Italy that grew from men who knew how to use books as well as how to collect them.

In Ferrara, the house of Este owned a library that had origins at least in the fourteenth century.^[47–49] A catalog of 1436 recorded 279 manuscripts, mostly Latin but with some Italian and French, and, in 1495, there was a record of 512 manuscripts, with only 2 Greek titles. After Clement VIII claimed Ferrara as a papal fief in 1597, Duke Caesar took the library to Modena in 1598, where it survives today in association with the university (founded 1772). There are remarkable illuminations, bindings,^[50] and vernacular works (Dante, Tasso, Provençal, among others), in all some 9,000 manuscripts in addition to important printed works acquired during the librarianships of Muratori, Tiraboschi, and other competent bookmen.

The Aragonese kings of Naples were diligent bibliophiles and patrons of scholarship, in particular Alfonso V, who assumed power in 1435. He was not only deeply concerned for the development of his library but also entertained such brilliant personalities as Lorenzo Valla.^[51–54] His son, Ferdinand, had less personal interest but continued to add to the collection, particularly with confiscated collections, until his death in 1494. A decade later Naples became a viceroyalty of the Spanish crown, and the noble library was broken up, part going to France and another part to Valladolid. Much of both portions survives.

Perhaps most famous of all the libraries in the smaller residences was that of Federigo da Montefeltro (1410 or 1411–1482), duke of Urbino. Primarily a politician and an effective condottieri chieftan, Federigo nevertheless made strong and successful efforts to furnish his seat with books and works of art. He was not well informed about literature, but he was wise enough to entrust Vespasiano da Bisticci with his buying. He kept a corps of some 30–40 copyists busy in Urbino. An inventory taken after Federigo's death recorded 1,120 volumes.^[55–58] In 1658, Alexander VII bought the collection and turned over the manuscripts (1,767 Latin and Italian, 165 Greek, and 128 Oriental) to the Vatican Library, but he gave the printed books to the library he had recently established for the University of Rome (henceforth called the "Biblioteca Alessandrina").

The Gonzaga family assumed power in Mantua in 1328. During the next century, Gianfranco and Lodovico III were personally concerned about the development of their book collections. In 1407, there were some 300 volumes, including some important Greek manuscripts.^[59]

^cThe libraries and library rooms of the Renaissance in Venice (the Marciana), Siena (in the cathedral), Urbino (in the castle), and elsewhere are noteworthy more for their architectural significance than for any advances in coordinating physical facilities with readers' needs. See von Stegmann.^[36]

THE VATICAN LIBRARY

The Vatican Library was destined to be the most important of all Renaissance libraries and to hold a leading position through the centuries.^[60] From very early periods there had been archives in the Holy See, and there were major collections in the fourteenth century at Avignon, now partially surviving in the Bibliothèque Nationale in Paris and in the Borghese Collection, which finally came into the possession of the Holy See in 1902. The real founder of the modern Vatican Library was Tommaso Parentucelli (1397–1455), who held the pontificate as Nicholas V for the last eight years of his life.^[61] As a young man, he established a respected position for himself among the Florentine humanists and was an eager collector. Bisticci recorded him as a bibliophile whose appetite for books excelled his means.^[62] When Cosimo was developing the library of San Marco, he entrusted Parentucelli with the chore of drawing up a list of desiderata.^[63]

The modest collection of some 350 manuscripts that Nicholas inherited from his predecessor, Eugene IV, was increased by every possible means through agents in Constantinople and book centers in Italy. He accepted only the best copies in fine bindings. His librarian, Giovanni Tortelli, a competent humanist in his own right, did much to promote Nicholas's objective to make the papal library the world's greatest scholarly collection. In 1455, there were some 1,200 important manuscripts, of which about 800 were in Latin. At Nicholas's death it was the largest library of its time.

Calixtus III (1455–1458) was not a bibliophile and scholar of the same stamp, and it was only in the papacy of Sixtus IV (1471–1484), of the della Rovere family, that the library began to thrive again. In 1481, there is a record of 3,499 volumes. Sixtus's first librarian was Giovanni Andrea dei Bussi,^[64,65] succeeded at his death in 1475 by another distinguished humanist, Bartolomeo Platina. In the same year, a budget was provided for the library, and it was increased in 1477. Adequate housing was provided in handsomely decorated quarters, executed by Domenico, David Ghirlandaio, and Melozzo da Forlì. The standards of service in the Vatican Library were superior for the age.

Two Medici popes whom we have already encountered, Leo X and Clement VII, were active patrons of the library. Under Paul III, a new catalog of manuscripts was prepared by Cardinals Marcello Cervini and Jacopo Sadoletto. During the sack of Rome by imperial forces in 1527, the library, now with over 4,000 manuscripts, was probably saved because Philibert of Orange had headquarters in the papal palace, a situation that probably made it immune to looting. It cannot be overlooked that the Vatican itself was the beneficiary of two of the greatest loots of libraries of all time; first, when Tilly

captured Heidelberg in 1622 and Duke Maximilian of Bavaria gave the great collection of the Palatina to Gregory XV; and second, when the apostate queen of Sweden, Christina, took to Rome the handsome collection made up largely of the spoils from her father's campaigns in Poland and the Germanies. The latter was bought by Alexander VII in 1690. The subsequent history of the Vatican Library and some of its great acquisitions belongs to the world history of scholarship, but the policies of Nicholas V have had an abiding influence.

FRANCE

It is ironical that France benefited enormously from the productive activities of Italian collectors and scholars, and yet there were few counterparts of the Italian Renaissance bibliophiles. The remnants of some of the great princely collections such as those in Pavia and Naples found a home in Paris, and rulers of the land promoted the Bibliothèque du Roi. While France produced a collector of the stature of Jean Grolier de Servin (1479–1565), private book collecting in France did not reach the proportions it had attained in Italy in the quattrocento until the age of Richelieu.

There had been a royal library in the Louvre, but as the Hundred Years' War waned, about 1430, a new collection began to take shape in Blois.^d Here the collections brought from Naples by Charles VIII and from Pavia by Louis XII found a home. The first French monarch to perform bibliologically in the style of the Medici was Francis I (1494–1547). He founded a library in Fontainebleau,^[70–73] which included the family collection of his own house (Angoulême), and, in 1544, he combined the Bibliothèque du Roi in Blois with it. After Laskaris acquired important Greek manuscripts for Lorenzo il Magnifico, he rendered the same service to Francis. Francis invested Guillaume Budé (1467–1540) with the office of *maître de librairie*, and this great humanist was lifelong adviser to the king.^[74] Although Francis preferred the manuscript to the printed book, he initiated legal deposit when, in 1536, he gave the librarian at Blois, Mellin de Saint-Gelais, the right to claim a copy of every book printed in France.^[75] Henri II (1547–1559) was an aficionado of fine bindings (as was Francis), and his monograms were an *H* combined with a *D* (his mistress, Diane de Poitiers; 1499–1566) or a *C* (his wife, Catherine de Médicis; 1519–1589).

Catherine was completely imbued with the bibliophilic tradition of her family.^[76] She had a library of some 4,000–5,000 ancient and modern texts in the

^dOf the extensive literature on the origins and history of the Bibliothèque Nationale, see Vallée^[66]–Serrurier.^[69]

Château of Saint Maur, supervised by her confessor, Benciveni, abbé de Bellebranche. It was the collection of a great *femme bibliophile* as well as of an avid reader. Her most noteworthy acquisition was the collection of some 800 manuscripts held by Marshal Pietro Strozzi after he fell at Thionville in 1558. She claimed it as Medici property. After her death, her creditors claimed the Strozzi collection, but it was saved by J.-A. de Thou for only 5,400 écus put up by Henri IV, and most of the collection is in the Bibliothèque Nationale today. The beautiful Diane's collection remained in the Château d'Anet until it was auctioned in 1724 after the death of Anna of Bavaria, who had inherited the castle in 1718.^[6] J.B. Guyon de Sardière bought most of the books, and they ultimately went with his collection to the Duc de La Vallière.^c

EASTERN EUROPE, ENGLAND, AND SPAIN

In the Germanies, the late arrival of humanism was to coincide with the early proliferation of printing and, later, with the Reformation, and to lend a peculiarly national character to the development of libraries and of private and princely collections. Elsewhere, the Renaissance collector appeared sporadically although occasionally in brilliant instances. Most famous was the great collection of King Matthias Corvinus (Hunyadi; 1458–1490) of Hungary.^[78–82] His chancellor, John Vitéz, had studied in Italy, knew the humanists of his day, and was a zealous collector of manuscripts; and his nephew, John Pannonius, followed in his steps. The Hunyadi had had relations with the Visconti and the Sforza, and, in 1476, Matthias married Beatrice of Aragon, daughter of King Ferdinand of Naples. With the help of Bisticci and others, he put together a library in Buda that any Italian prince might have envied. His preference was for handsomely decorated manuscripts from Italian artists, and he was not greatly concerned with the importance of texts. The fame of the Corviniana created exaggerated rumors about its quantity, but there may well have been up to 3,000 titles. His early death, Beatrice's return to Italy, and the indifference of Matthias's successors hastened the dispersion of the collection. After the crushing defeat of the Hungarians at Mohács in 1526, the Turks took what had survived (finally restored in part to the University of Budapest by the Osmanli sultan in 1877). There are other remnants all over the Western Hemisphere.^[83]

Hungary's northern neighbor, Poland, had a major intellectual center in Cracow, where the university had been founded in 1364 and was to acquire distinction, particularly in mathematics and astronomy, culminating in the work of Italian-trained Copernicus a century and a half

later. Gregory Sanok, a *magister* at Cracow, was a zealous humanist and book collector, and the Jagiellonian University owes much to him.^[84]

Humanism found its way to England by the end of the fifteenth century with scholars of the stature of William Grocyn and Thomas Linacre, but neither they nor others were collectors in the tradition of the Italians. Thomas Wotton (1521–1587), a sort of an English Grolier who inscribed his Italianate bindings “Thomas Wottoni et amicorum,” was the closest to a Renaissance collector that England had.^[85] Sir William Pickering (1516–1575) had similar tastes. His daughter married Sir Edward Wotton, Thomas's son. The combined library came to the Stanhope (Chesterfield) family, and the collection survived until 1920 when it was sold at Sotheby's.

Spain had a distinguished collector in the son of the admiral, Don Fernando Colón (1488–1539), who assembled an important library of some 12,000 volumes and deposited it in the Dominican monastery of San Pablo in Seville, but it was neglected and plundered.^[86] The library of San Lorenzo del Escorial was a commitment by Philip II after the battle of Saint Quentin in 1557, established formally in 1565.^[87] Both contained rich collections on Renaissance culture from the beginning, but neither were collected or administered in the same spirit, or for the same purpose as were the libraries of the Medici or of the Holy See of Nicholas V.

THE GERMANIES

Humanism first touched German-speaking territories when Cola di Rienzi, friend and confidant of Petrarch, pleaded with Charles IV in Prague for regeneration of the church. Petrarch himself corresponded with the imperial court. But humanism came north slowly. In 1417 and 1418, Poggio was actively engaged in his constructive carpetbagging in German-speaking areas. Poggio rescued many a basic manuscript; but another brilliant contemporary, Enea Silvio Piccolomini (1405–1464), Pius II after 1458, was the most effective representative of humanism north of the Alps when he served as secretary in the chancellery of Friedrich III.^[88] Thus, in the University of Vienna, and later in other institutions, interest in classical studies began to expand slowly. There is only slight evidence of the acquisition of classical manuscripts by the existing collections in universities, city halls, and monasteries. Most important were private collectors whose inventories reflected the penetration of the new learning. Nikolaus von Cues, Albrecht von Eyb, Hartmann Schedel, and the Fuggers were among the prominent early collectors inspired by Italian humanism.

Nikolaus von Cues (1401–1464), latinized as Cusa or Cusanus, cardinal after 1448, had become a doctor of both laws in Padua and was influenced not only by

^cFor the subsequent history of the La Vallière and other important collections, mentioned here see Bogeng, Bogeng^[6] and Thompson.^[77]

German mysticism but also by Neoplatonism and humanism.^[18,89–91] He recognized significant classical manuscripts in Fulda and probably took a basic Plautus manuscript (now Vat. Lat. 3870) from there to Rome. He also discovered Tacitus manuscripts and may have been the first German in modern times to know the *Germania*. He read Greek and had the opportunity to collect in Constantinople. A significant fact is that, in 1459, his long-time friend Enea Silvio appointed him papal vicar-general. Cues willed his property, including philosophical apparatus and books, to a hospital in his home town of Bernkastel-Kues on the Mosel, and 314 manuscripts (270 from his own collection) are still there, although much has been removed over the centuries (e.g., more than 30 are now in the British Library).

Albrecht von Eyb (1420–1475), Franconian baron, spent 13 years in the south and was a zealous collector.^[92,93] He translated Plautus, and two of his manuscripts of this author are in Augsburg today. His library, including printed books, went to the Eichstätt Cathedral, but it was dispersed without any accurate record. About 20 pieces have been identified in modern German libraries.

Hermann Schedel (1410–1485) and his cousin Hartmann Schedel (1440–1514) both studied medicine in Padua and brought humanism to their native Nuremberg.^[94,95] Hermann's library was inherited by Hartmann, famous for his *Weltchronik*. The latter had studied Greek, as well as medicine, in Padua. While he owned important manuscripts, he also collected printed books. The catalog shows 632 titles. The collection was sold in 1552 to Hans Jakob Fugger, and it contained some 400 collective manuscript volumes and 700 printed books. It was acquired in 1571 by Duke Albrecht V of Bavaria, the founder of the Munich Hofbibliothek (now Bayerische Staatsbibliothek). About 360 manuscripts belonging to Hartmann Schedel have been identified in the modern collections.

Johann von Dalberg (1455–1503) spent most of his productive life in Heidelberg, where he was chancellor of the university from 1480 to 1497.^[96] He was closely associated with humanists of the stature of Rudolf Agricola, Johannes Reuchlin, and Dietrich von Pleningen, and he also collected a significant library. He bought manuscripts in Italy and, back home, commissioned the Strassburg printer and bookseller Adolf Rusch to buy classical texts at the Frankfurt Fair. His librarian, Johannes Vigilius, professor of law, also bought for him at the fair. After Dalberg fell out with the Palatine elector in 1497, he retired to Worms where he was bishop. Presumably, his collection remained in the episcopal see but was gravely neglected. Fewer than 20 titles from this once great collection can be identified today, mainly in various German libraries.

Maximilian I, emperor from 1493 to 1519, had a library as archduke and acquired a vastly greater treasure of books in the dowry of Marie of Burgundy.^[97,98] He was a romantic (“the last knight”) but may well have listened to

Enea Silvio in Vienna. Certainly, his confidence in Konrad Celtis (1459–1508) indicated his inclination to humanism.^[6] Celtis was entrusted with the custody of part of Maximilian's collection, inherited from his father, Friedrich III, and left in the residence of Wiener Neustadt (the more valuable part was moved to Castle Ambros near Innsbruck). In 1497, Celtis was appointed by Maximilian to the chair of poetry and eloquence at the University of Vienna, and it became an important center of humanistic activity with men such as Celtis, the versatile Joachim von Watt (Vadianus; *infra*), and the historian Johannes Cuspinianus. The latter built a handsome collection that was acquired in 1530 by the Vienna bishop Johannes Faber (died 1541), whose collection of 2,162 items passed to the University Library. The collections in Innsbruck were not always given the best care, but ultimately most of these (with subsequent additions) and the material in Wiener Neustadt found a home in the Austrian National Library.

One of the most spectacular events in Celtis's career was the discovery of a map of Roman military roads, 34 centimeters by 7 meters in length, in Worms. It was to have been edited by Konrad Peutinger (1455–1547), but it disappeared until 1714 when Prince Eugene of Savoy discovered it and later willed it to the Hofbibliothek in Vienna. The *Tabula Peutingeriana* is famous enough,^[99] but the role of Peutinger, an Augsburg patrician, in German humanism is even more important.^[100] Today his collection of over 2,000 works, a good proportion reflecting Peutinger's humanistic interests, has been scattered, with less than 100 items identified (happily, 36 went to the Augsburg Stadtbibliothek in 1810). Peutinger did compile two catalogs, a rich source for our knowledge of humanistic book collecting in Germany.

In Nuremberg, the patrician Willibald Pirckheimer (1470–1550) was the central figure in the humanistic movement.^[6,101,102] After study in Pavia and Padua, he assumed a respected position in his native city. He was a friend not only of Celtis but also of Reuchlin and Erasmus. An indefatigable collector, he boasted, in 1504, in a letter to Celtis, that he owned every Greek book printed in Italy. Pirckheimer's library remained in the family for over a century after his death and was sold to Thomas Howard, earl of Arundel, in 1636. It was donated by Henry Howard to the Royal Society in 1667, and, in 1831, the manuscripts (except the Oriental ones) were sold to the British Museum.

Schlettstadt in Alsatia produced two major humanists, Jakob Wimpheling (1450–1528)^[103,104] and Beatus Rhenanus (1485–1547).^[105] We know almost nothing about Wimpheling's library, although he gave books regularly to the church library there. Today the rich old Stadtbibliothek of Schlettstadt has two manuscripts and three printed books that once belonged to Wimpheling. His literary production is well known, but his interest in

book collecting is equally meaningful. In 1496, he and Johannes Vigilius (supra) visited Johannes Trithemius (or Trithem; 1462–1516), abbot of the Benedictine monastery in Sponheim.^[106–108] Trithemius's collection of over 2,000 works included many Greek works and others of obvious humanistic interest. It was a victim of secularization in 1564, and only about 30 pieces are identifiable in various repositories today. Rhenanus, a competent historian, critic, and philologist, was associated with the great Basel printers Amerbach and Froben (Erasmus's intimate) and had a collection of over 900 volumes, which he willed to his native city. Neglected for centuries, it finally was given a suitable home in 1889.

Ulrich von Hutten (1488–1523), famous for his participation in the second part of the *Epistolae obscurorum vivorum* (1515–1517) in defense of Reuchlin's cause, led too turbulent and itinerant a life to have gathered a substantial library.^[109,110] Yet he did have a collection probably useful at least for reference. It was with his friend Franz von Sickingen on the Ebernburg when the latter fell at the end of the Knight's War in 1523 and was captured and sold in Heidelberg by the imperial forces. Most curious about Hutten's bibliological interests is the rather strong evidence that he stole books from Fulda.^[111,112]

In Münster, the canon Rudolf von Langen (ca. 1438–1519) had traveled in Italy in 1466 and most probably acquired books.^[113] The cathedral library received them as a legacy, but virtually all were destroyed in the Anabaptist disturbances of 1534. More important was a protégé of Langen and a friend of Hutten and Reuchlin, Hermann von dem Busche, or Pasiphilus (1468–1534), best known for his *Vallum humanitatis* (1518). Langen urged him to travel in Italy, and he was later at various German universities, always defending Lutheran principles. He collected a small but choice library, which he willed to the Münster Cathedral; but a friend, Rotger Schmising, himself the master of a library, took the books to protect them from the violence of the Anabaptists. The latter carried out his friend's wishes and willed them to the cathedral upon his death in 1547. Most passed, about 1589, to the Jesuits, whose library became the basis of the University of Münster Library. Some 20 books, mostly Venetian editions of Greek and Roman authors, have been identified as Busche's original property.

The greatest of the German humanists, Johannes Reuchlin (1455–1522), was also one of the most zealous book collectors of his age.^[114–119] He began to collect books as a student in Paris under his famous master, Johannes Heynlin vom Stein,^f and he constantly acquired books during his Italian trips of 1482, 1490, and 1498. He knew Aldus Manutius and corresponded with him about book acquisitions. Latin, Greek, and Hebrew books fell

within the scope of his interest. Active in a troubled era and the central figure of all sorts of political issues and controversies about church policy, Reuchlin left an enduring legacy to subsequent ages in his dedication to seeking historical accuracy through sound texts. When the converted Jew Johann Pfefferkorn proposed the destruction of all books in Hebrew, Reuchlin replied that only books that were antagonistic to Christendom should be removed from the shelves, and that the Jews should be compelled to furnish books for the universities and set up chairs of Hebrew in all of them. Reuchlin was vigorously supported by the humanists, above all in the *Epistolae obscurorum vivorum* (supra; first part most probably largely by Crotus Rubianus and the second most probably largely by Ulrich von Hutten), a satire in purposely bad Latin reinforcing the *Epistolae clarorum vivorum* (1514) issued by Reuchlin's friends. Toward the end of his life, he encountered grave problems about the disposition of his books. The larger part of his collection went first to the church in Pforzheim and ultimately to the Landesbibliothek in Karlsruhe, but there are also a few in other major libraries of western Europe.^[5,121,122]

Desiderius Erasmus (1466 or 1469–1536) was the most influential of the humanists, north or south; and it was inevitable that his prestige, his intimacy with Aldus Manutius, his position as an authoritative consultant of Johannes Froben, and his stature in the world of learning resulted in a major private collection.^g In the years 1524–1526, a young Polish nobleman, Johannes Laski, lived with Erasmus in Basel. The latter, feeling the need of funds to live in the style he desired, sold his books to Laski on the condition that he keep them and have the use of them in his lifetime. At the time of Erasmus's death, there was a sketchy checklist of 413 titles. The new owner, who had held a high position in the church in his native Poland, forsook his old faith in 1538 and dedicated himself to promotion of Protestantism in North Germany, Denmark, the Low Countries, and England. He sold the books piecemeal, and today only 15 can be identified, scattered from England to Cracow.

REFORMATION LIBRARIES

A major emphasis of the Reformation leaders—above all, of Luther himself and of Philipp Melanchthon (1497–1560), the “Preceptor Germaniae” and great-nephew of Reuchlin—was on the utility of books and libraries for the new faith and for popular culture in general.^[5,129,130] An immediate result was the incorporation of policies for church libraries in the organizational documents of individual congregations. The oldest (1528) and one of the most important policy statements is that of Johannes

^fHeynlin died in the Carthusian monastery in Basel and left his collection to this institution. The books have been in the University of Basel Library since the Reformation. See Heusler.^[120]

^gOf the voluminous Erasmus literature, one might start with Bömer^[5] and Smith^[123]—ter Horst.^[128]

Bugenhagen for the church of Saint Andreas in Braunschweig, but the collection of 336 volumes willed to the church in 1495 by Gerwin von Hameln was reported in 1587 to have been sadly neglected.^[131,132] Bugenhagen drew up similar policy statements for churches in Hamburg, Lübeck, and his native Pommerania, where he visited all libraries and archives in the province on the order of Duke Bogislaus X. We know something about at least nine newly founded church libraries at Melancthon's death in 1560.

The libraries depended on gifts and secularization of Roman establishments for their growth. Just as in England, they would have been vastly richer had not biblioclasm accompanied the dissolution of monasteries. A ducal order in Pommerania in 1552 directed that unsuitable (i.e., "popish") books from monasteries be sold for scrap. More serious was the violence in the Peasants' War of 1524–1526.^[133] In Thuringia alone, 70 monasteries and their contents were destroyed, and reports from other places are staggering. Libraries of secular nobility and high church officials also suffered.

Luther's insistence on the development of education resulted in a number of new schools with libraries. Some 40 such institutions, which had libraries, survived into the twentieth century, and one might guess that in the sixteenth century, there were probably as many more for which we have no firm evidence of the presence of libraries. Even more significant was the effect of the Reformation on the universities, both the older ones and those founded at this time (Marburg, Königsberg, and Jena).

In Leipzig, there was no general university library, only faculty collections, until 1543.^[134] Thanks to the secularization of three monasteries in Leipzig and seven others in Saxony, the university library was enriched by about 1,500 manuscripts and 4,000 printed books. The real founder of the library, Kaspar Börner, left his collection to it upon his death in 1547. Melancthon's friend Joachim Camerarius was librarian until his death in 1574. After 1550, the library was open for two hours every week.

In Basel, the puny university library received a major impulse forward in 1535 when the rector, Bonifatius Amerbach, persuaded all shops in this major center of printing to deliver one copy of each book to the university.^[120] In 1559, the university acquired the holdings of the Dominican monastery and of the cathedral. The catalog of Heinrich Pantaleon, the librarian, shows a *bibliotheca antiqua* (to 1583: 150 manuscripts and 243 printed books) and *bibliotheca nova* (810 volumes, excluding 190 works donated by Professor Martin Borrhus in 1564).

In Tübingen, there was provision for a library, in 1477, when the university was founded.^[135,136] There were faculty libraries and also a Bibliotheca Publica as early as 1501, but the latter was most likely destroyed with the burning of the *Sapienzhaus*. It was just about the same

time that the Reformation reached Tübingen, and a new general library was put together and housed in a recently constructed university building, where it remained until 1819.

Elector Frederick ("the Wise"; 1486–1525) founded the University of Wittenberg in 1502, where humanism was welcomed from the beginning; and, in less than two decades, the Reformation was to find there an intellectual stronghold.^[137–139] The first sure evidence of the founding of a library at Wittenberg is from December 1512 when the elector wrote to Aldus Manutius asking him for a list of available titles, most probably on the advice of his secretary, the humanist and reformer Georg Spalatin (born Burckhardt; 1484–1545). A catalog of Spalatin's personal library in the Gotha Landesbibliothek also contains invoices for other books purchased on behalf of the elector. Under Elector John Frederick ("the Magnanimous"; 1532–1547), Spalatin again became librarian and had an annual appropriation of 100 guilders after 1534. We know a good deal about Spalatin's administration of the Electoral Library,^[140] and we know that the library served the faculty and that Luther and Melancthon used it.^[141] Some pieces from Luther's personal library can be identified,^[142] but of Melancthon's collection, we know only a volume in the Halle University Library and perhaps one in the Vatican.^[143]

Margrave Phillip I ("the Generous"; 1509–1567) of Hesse founded the University of Marburg in 1527, and its library was established on the basis of secularized monasteries.^[144] About 1532, the library was moved from the castle to the Discalced monastery, but it grew slowly despite a regular appropriation. We know a good deal about the administration of the library. Medieval traditions (e.g., chaining of books in the 1564 regulations) persisted. The professor of logic, Heidericus Theophilus Leonicerus, supervised the library from 1564 to 1581, and he prepared a catalog (not preserved) in 1578. The collections were increased substantially in 1605 with about 650 volumes from the collection of Count Christoph Ernest zu Diez, but the library did not thrive for two centuries, what with the division of holdings with Giessen in 1650. A major impulse forward came in 1748 when Marburg acquired the collection of the lawyer Johann Georg Estor.

Elector John Frederick I of Saxony ("the Magnanimous") was finally defeated in the Schmalkaldic War at Mühlberg in 1547, and the gymnasium founded at Jena in 1548 received his library, the "Electoralis." A decade later, the school became the University of Jena.^[145–147] The "Electoralis" was extraordinarily rich in manuscripts and printed books, altogether about 3,100 pieces, relating to the Reformation, and it remains today one of the major resources for the study of the origin and early development of Lutheranism.

There was a library in the University of Heidelberg soon after its founding in 1386,^[148] but it was the

incomparable Palatina that served the university for three-quarters of a century until it was sent to Rome by Duke Maximilian of Bavaria (supra).^[149-151] It was actually founded by Elector Philipp ("the Honest"; 1476–1508), patron of Chancellor Johann von Dalberg (supra), but it was developed by Ottheinrich (1502–1559; elector 1556–1559). He not only promoted the Reformation vigorously but also had the laudable ambition to develop a library comparable to those of the Italian Renaissance princes. He purchased books from all over Europe, incorporated into his collection that of the famous old monastery at Lorsch, and conveniently forgot to return manuscripts borrowed from the Mainz Cathedral. The library from his seat at Neuburg and the Electoral Library were housed with a collection in the Church of the Holy Spirit, and it is clear from various sources that Ottheinrich meant for the collection to be used by the members of the university along with other books that had been at their disposal. One of the most noteworthy additions came to the library in 1584 upon the death of Ulrich Fugger, the only Protestant in this distinguished Augsburg patrician family. He left his collection to the Palatina in gratitude for the hospitality of Elector Frederick III (1553–1576). As we have noted in connection with the Vatican Library, the catastrophe came in 1622 when Tilly directed the greatest bibliographical loot in history. Except for the partial restoration of 1816, the modern University of Heidelberg Library dates from 1706.

The situation was somewhat similar in Königsberg, where there was a court library (Schlossbibliothek) available to the university and also a university library.^[152,153] The last grand master of the Teutonic Order, Albrecht von Brandenburg, became a Protestant in 1525 and made the old lands of the order a hereditary duchy of Prussia. He soon began to acquire books with Lukas Cranach and his own secretary, Crotus Rubianus (supra), as his agents. After Crotus left Königsberg, a Dutchman, the ex-Carthusian Felix König, became Albrecht's librarian and conducted his office vigorously,^[154] as did Heinrich Zell, librarian from 1557 to 1564. Over the years, the library was reasonably well cataloged and available to scholars. When Albrecht founded the university in 1544 he provided it with its own library, and ultimately, in 1827, the Schlossbibliothek and the University Library were combined as the Königliche (Staats-) und Universitätsbibliothek, a great library, which disappeared in 1945. Albrecht had his private collection, famous for the 20 volumes of his "Silver Library" books bound in finely wrought silver covers, most executed in Königsberg, as were the more conventional bindings.^[155,156]

There were princely libraries elsewhere in Germany (notably in Dresden, Wolfenbüttel, Dessau, and Kassel) that were significant into our own times, but these generally pushed beyond the immediate objectives of Renaissance and Reformation. In Switzerland, the university libraries in Bern, Lausanne, and Geneva (originally based in part on Calvin's collection) have roots in the

Reformation. A particularly noteworthy monument of the period is the collection of Joachim von Watt, or Vadianus (1483 or 1484–1551; supra), humanist and reformer of Saint Gall, now in the local municipal library (Stadtbibliothek).^[157-159]

CONCLUSION

Perhaps with the founding of the University of Leiden in 1575, Renaissance, humanism, and Reformation had run their destined courses, and libraries began to serve scholars in a gradually evolving tradition of analytical scholarship with meticulous attention to detail. The resources had been provided by the great collectors of the previous two centuries; the methods and standards, by scholars with the insight and discipline of Erasmus and Reuchlin.

Resource Description Framework (RDF)

Nicholas Gibbins

Nigel Shadbolt

School of Electronics and Computer Science, University of Southampton, Southampton, U.K.

Abstract

The Resource Description Framework (RDF) is the standard knowledge representation language for the Semantic Web, an evolution of the World Wide Web that aims to provide a well-founded infrastructure for publishing, sharing and querying structured data. This entry provides an introduction to RDF and its related vocabulary definition language RDF Schema, and explains its relationship with the OWL Web Ontology Language. Finally, it provides an overview of the historical development of RDF and related languages for Web metadata.

INTRODUCTION

The Resource Description Framework,^[1] or RDF, is a knowledge representation language for the Semantic Web,^[2,3] and is used to express knowledge about things both on and off the Web; RDF can be used to write metadata about web pages and to describe real-world objects with equal facility. RDF is a key language in the technical architecture of the Semantic Web, being both a format for describing instance data, and the foundation for the vocabulary definition languages RDF Schema^[4] and OWL.^[5]

The Semantic Web is a development of the World Wide Web that aims to provide an infrastructure for machine-understandable information on the Web. By expressing information in a form that makes the meaning, or semantics, accessible to machines, the goal of the Semantic Web is to create a next-generation Web in which information can be mediated by software agents on behalf of and without intervention from their users. At present, information on the World Wide Web is predominantly textual and requires human understanding to interpret it; the meaning of such natural language information must be made explicit if a machine is to be able to make sense of it. In artificial intelligence, the long-standing discipline of knowledge representation has developed a variety of approaches for expressing information to facilitate reasoning; these knowledge representation languages are of varying degrees of complexity and expressivity, but they share the common feature that they encode information as structures that can be formally interpreted to give some sense of their meaning.

By itself, RDF provides a domain-neutral framework for information interchange that must be augmented with terms to meet the requirements of a specific application domain. For example, a bibliographic application needs to be able to talk about works and authors, while an

e-commerce application needs to be able to talk about orders and prices. This orientation to a particular application domain or domains is accomplished by means of one or more domain vocabularies, or *ontologies*.^[6] In Computer Science, an ontology is a formal description of a domain of knowledge. Gruber^[7] defines an ontology as “a specification of a conceptualization”; in other words, a formal account of an abstract model of some application domain which includes, but is not limited to, the classes of entity that exist within the domain, and the relations that link those entities.

RDF has two accompanying ontology languages, RDF Schema^[4] and the Web Ontology Language OWL.^[5] RDF Schema is the simpler of the two, and provides a small set of modeling constructs for defining classes, properties and certain global constraints on those properties. OWL is more expressive (and correspondingly more complex to reason with), and provides a larger set of modeling constructs that allows an ontology designer to more richly specify classes in terms of the necessary and sufficient conditions for membership of those classes. An in-depth treatment of OWL is beyond the scope of this entry; we refer the reader to^[8,9] for further information.

In addition to these languages for defining RDF vocabularies, the World Wide Web Consortium (W3C) has also published an SQL-like query language for interrogating RDF graphs, known as the SPARQL Protocol and RDF Query Language^[10,11] (or more simply as SPARQL).

THE TRIPLE MODEL

The information presented on the Semantic Web can be viewed as a directed, labeled graph in which the nodes stand for things and values, and the edges (with their labels) are the properties that relate nodes to one other.

The fundamental unit of knowledge representation is the triple, a directed edge that represents a binary relationship between two nodes. Customarily, the components of this triple are referred to as the subject, the predicate and the object: the subject is the node that the directed edge leaves, the object is the node that it enters, and the predicate is the type of the edge. Alternatively, a triple could be considered to be a statement that a particular entity (the subject) has a property (the predicate) with a particular value (the object); this corresponds closely to object-oriented^[12] or frame-based^[13] models of knowledge representation.

The nodes in an RDF graph denote resources, which are things in the domain of discourse. Nodes may be Uniform Resource Identifiers (URIs),^[14] literals, or blank nodes. URIs are used to denote things with identity, such as web pages, organizations, people, or books. Literals are values such as character strings, numbers or dates, which do not have identity; a (plain) literal is considered to denote itself, so two literals with the same value are treated as if they were the same literal. Finally, blank nodes are used to indicate the existence of a thing, without saying anything about the name of that thing.

With the careful use of URIs, RDF allows machines to unambiguously identify entities and vocabulary terms; each URI identifies a single thing, even though it is expected that there may be multiple URIs that identify the same thing (effectively synonyms for the thing). Adapting an example from the RDF Primer,^[15] we can represent the statement (that a particular web page was created by John Smith) as a triple with:

- a subject, <http://www.example.org/index.html>
- a predicate, <http://purl.org/dc/terms/creator>
- and an object, <http://www.example.org/staffid/85740>

In this example, we refer to the web page using its URI: <http://www.example.org/index.html>. We also use URIs to refer to John Smith (<http://www.example.org/staffid/85740>), and to the creator relation (<http://purl.org/dc/terms/creator>), taken from the Dublin Core vocabulary.^[16] Presented graphically, this statement forms a graph containing two nodes with a single directed edge between them, as shown in Fig. 1.

This triple can also be written as:

```
<http://www.example.org/index.html> <http://purl.org/dc/terms/creator> <http://www.example.org/staffid/85740>
```

Fig. 1 An RDF graph containing a single triple.

This example uses a syntax based on the Notation 3 syntax for RDF^[17] (discussed in more depth below), in which terms in angle brackets denote resources identified by URIs. In the order written, the three terms are the subject, predicate and object of the triple, and the completed triple is followed by a period.

COMPARING XML AND RDF

The relationship between RDF and the eXtensible Markup Language (XML)^[18] warrants further explanation. Both are used to represent structured information on the Web, and XML is used as the standard syntax for RDF, but the two languages are distinct and have different characteristics.

The most fundamental difference between XML and RDF is in the way in which they structure information. As described above, RDF structures information as a labeled, directed graph, whereas XML is limited to tree structures, which has consequences in the way that data from different sources can be merged. Merging two RDF files can be accomplished by taking the union of the underlying graphs; this operation does not require any knowledge of the vocabularies (schemas) that are used in these graphs. In contrast, merging two XML files that use different schemas is a more difficult operation, because the resulting file will not validate using either schema, but rather a new schema that combines the two original schemas must be used instead.

An XML document can be parsed to give an unambiguous structure, but this structure has no innate meaning; the meanings of XML schemas must be agreed between the relevant parties on a case-by-case basis. RDF differs from XML in that the triples that are created when an RDF file is parsed have a well-defined semantics, which facilitates further information exchange by providing a basic set of rules for manipulating the information while preserving its knowledge content. Together with the ease of merging RDF files, these formal semantics mean that RDF has considerable advantages for information interchange over XML, and can be used to facilitate interoperability between heterogeneous systems.

Finally, RDF uses URIs to refer to objects in the domain of discourse. This has been used to promote what is known as the linked data model of publishing.^[19,20] Given that the resources in an RDF graph may be represented by URIs, the aim of the linked data model is that it should be possible to dereference those URIs and by doing so retrieve a description of the resources that they represent. In effect, linked data results from the hypertextual foundations of the World Wide Web (and so of the Semantic Web); users of the Web follow links to obtain human-readable information in the form of web pages, so Semantic Web agents should be able to do likewise. Linked data may be implemented using several different

Web technologies; a general overview of the more common approaches is given in Sauermann,^[21] and a summary of the best practices for publishing ontologies as linked data is given in Berrueta.^[22]

FEATURE SUMMARY

RDF defines the triple model of data and a standard syntax for expressing those triples (RDF/XML), but does not constrain the vocabulary used in those triples: the URIs denoting categories and relations that we might wish to use in our descriptions. RDF Schema defines a basic vocabulary for use with RDF that lets users represent and define vocabularies that are specific to their problem domains. This basic vocabulary supports the following primitive modeling constructs:

- Named classes and explicit hierarchies of classes
- Named properties and explicit hierarchies of properties
- Global ranges and domains of properties
- A reification vocabulary for using triples to describe other triples
- Containers and collections, two methods for representing information about groups of resources
- A set of ancillary properties for providing human-readable documentation and links to further information

All of the vocabulary terms defined in RDF Schema are assigned URIs from one of two namespaces, `rdf` and `rdfs` (for largely historical reasons that originate with the first version of RDF, the terms defined in RDF Schema are divided across two different namespaces). For clarity, we will write `rdf:XXX` as a shorthand for `http://www.w3.org/1999/02/22-rdf-syntax-ns#XXX`, and `rdfs:YYY` as a shorthand for `http://www.w3.org/2000/01/rdf-schema#YYY`. This abbreviation style, whereby a lengthy URI is reduced to a short string consisting of a namespace abbreviation (representing a URI prefix), a separating colon, and a name defined in that namespace (which is to be appended to the URI prefix), is known as a Qualified Name or QName.^[23,24]

Classes

RDF Schema defines the property `rdf:type` that allows a user to indicate that a resource is an instance of a particular class. For example, if we wished to indicate that John Smith (denoted by the URI `http://www.example.org/staffid/85740`) was an instance of the `Person` class defined in the FOAF (Friend of a Friend) ontology,^[25] we would write the triple:

```
<http://www.example.org/staffid/85740>    rdf:type
<http://xmlns.com/foaf/0.1/Person>.
```

In this example, `rdf:type` is a QName which represents the “type” from the `rdf` namespace; the QName is expanded

to the URI `http://www.w3.org/1999/02/22-rdf-syntax-ns#type` as described above. We can define a resource to be a class by declaring it to have an `rdf:type` of `rdfs:Class`. For example, to define a class of documents (represented by the URI `http://example.org/ontology#Document`), we would write:

```
<http://example.org/ontology#Document> rdf:type rdfs:
Class.
```

These classes may be arranged into an explicit hierarchy by stating that a class is a subclass of another class, using the `rdfs:subClassOf` property:

```
<http://example.org/ontology#Newspaper>  rdfs:sub-
ClassOf <http://example.org/ontology#Document>.
```

In this example, we have stated that the class `Newspaper` is a subclass of the class `Document`, which is equivalent to saying that every newspaper is also a document (or to put it a third way, that the set of newspapers is a subset of the set of documents).

Properties

In the same way that classes are defined in RDF Schema, properties may be defined by declaring a resource to be of `rdf:type`, `rdf:Property`. Properties may be arranged into hierarchies to represent the specialization and generalization of relationships. For example, an “employed by” property might be considered to be a specialization of an “affiliated with” property. A property can be declared to be a specialization of another property by stating that it is `rdfs:subPropertyOf` the other.

```
<http://example.org/ontology#employedBy>  rdfs:sub-
PropertyOf <http://example.org/ontology#affiliatedWith>.
```

Properties can be further described by defining their domain and range using the `rdfs:domain` and `rdfs:range` properties. The domain of a property is the class of objects that it runs from. For example, the “employed by” property might run from a class `Person` (being the class of people). The range of a property is the class of objects that it runs to; the range of “employed by” might be the class of organizations. These constraints on properties permit a reasoner to make inferences about the types of objects that are involved in a relationship.

```
<http://example.org/ontology#employedBy>  rdfs:
domain <http://example.org/ontology#Person>.
```

```
<http://example.org/ontology#employedBy>  rdfs:
range <http://example.org/ontology#Organisation>.
```

Containers and Collections

RDF Schema provides two different mechanisms for defining groups of objects, each with separate properties. The first of these, RDF containers, represents a group of objects with a resource which may be typed to informally indicate the intended semantics of the group; a group of type `rdf:Bag` is unordered, one of type `rdf:Seq` is an ordered sequence, and one of type `rdf:Alt` is a set of

alternatives from which a single member should be selected (in practice, `rdf:Alt` is rarely used). The vocabulary pertaining to containers includes a countably infinite set of special properties (the ordinal container membership properties `rdf:_1`, `rdf:_2` and so on), which indicate both the membership of a resource in the group, and for the ordered `rdf:Seq`, the position of a member within the group.

A sequence of three resources (for example, three email addresses) would be represented as follows:

```
<http://example.org/data#seq1> rdf:type rdf:Seq.
<http://example.org/data#seq1> rdf:_1 <mailto:groucho@example.org>.
<http://example.org/data#seq1> rdf:_2 <mailto:chico@example.org>.
<http://example.org/data#seq1> rdf:_3 <mailto:harpo@example.org>.
```

The container vocabulary has the disadvantage that it produces groups that are open and mutable. There is no way to state that a group is closed, that is that the stated members of a group are the only members; a third party could assert that the above sequence has an extra member by adding the following triple:

```
<http://example.org/data#seq1> rdf:_4 <mailto:karl@example.org>.
```

The collection vocabulary addresses this by supporting the definition of closed groups that can have no further members. A collection is a recursive data structure that defines a group as a resource of type `rdf:List`, which consists of the first object in the group (indicated using the `rdf:first` property), and another `rdf:List` which contains the remainder of the group (indicated using the `rdf:rest` property). This second `rdf:List` contains the second element of the collection, and another `rdf:List` with the remainder of the collection, and so on. This recursion is terminated by the term `rdf:nil`, which represents an empty list. The example above could be represented in the container vocabulary as follows:

```
<http://example.org/data#list1> rdf:type rdf:List.
<http://example.org/data#list1> rdf:first <mailto:groucho@example.org>.
<http://example.org/data#list1> rdf:rest <http://example.org/data#list2>.
<http://example.org/data#list2> rdf:type rdf:List.
<http://example.org/data#list2> rdf:first <mailto:chico@example.org>.
<http://example.org/data#list2> rdf:rest <http://example.org/data#list3>.
<http://example.org/data#list3> rdf:type rdf:List.
<http://example.org/data#list3> rdf:first <mailto:harpo@example.org>.
<http://example.org/data#list3> rdf:rest rdf:nil.
```

As can be seen, an RDF collection requires more triples to represent the same group of objects than does a container, but it has the property that an attempt to tamper with the collection by adding extra members will result in

an ill-formed data structure in which one of the component `rdf:Lists` has more than one `rdf:first` or `rdf:rest` property.

Reification

Reification is a mechanism for treating triples as first-class objects about which other assertions can be made (that is, as resources which can be referred to as the subjects or objects of other triples). The reification vocabulary in RDF Schema introduces the class `rdf:Statement`, which represents triples, and the properties `rdf:subject`, `rdf:predicate` and `rdf:object`, which represent the three components of a triple.

If we were to reify our original example (that a web page was written by John Smith), we would construct a small RDF graph containing four triples: one to represent the type of the reified statement, and one for each of the three components.

```
<http://example.org/data#stmt1> rdf:type rdf:Statement.
<http://example.org/data#stmt1> rdf:subject <http://www.example.org/index.html>.
<http://example.org/data#stmt1> rdf:predicate <http://purl.org/dc/terms/creator>.
<http://example.org/data#stmt1> rdf:object <http://www.example.org/staffid/85740>.
```

In this example, the statement itself is represented by the URI `http://example.org/data#stmt1`; this may be used in other triples to express information about the statement. For example, if John Smith wanted to assert that he was the author of the statement, he could write:

```
<http://example.org/data#stmt1> <http://purl.org/dc/terms/creator> <http://www.example.org/staffid/85740>.
```

The reification vocabulary provides a simple framework that supports the expression of fine-grained (triple level) provenance information about Semantic Web data. However, RDF reification is rarely used in practice, with many RDF practitioners preferring to use named graphs (a set of triples that is identified by a URI) to achieve the same ends, that of making assertions about other assertions.

Ancillary Properties

Finally, RDF Schema contains a number of properties that are not used to define ontology concepts, but to provide human-readable documentation, or to link to related information. The `rdfs:label` property is used to attach a human-readable label to a resource (necessary, given that URIs may be verbose), while `rdfs:comment` is used to add a comment (a natural language definition or rationale, perhaps). The `rdfs:seeAlso` property is used to indicate another resource which contains further information about a given resource; this is specialized by the `rdfs:isDefinedBy` property, which can be used to indicate the Web resource that defines a particular resource (for example, an ontology).

SYNTAX

The standard (normative) syntax for serializing RDF graphs for storage or transmission is RDF/XML.^[24] This syntax is defined by a set of rules for transforming an XML document into an RDF graph;^[18] element names, element contents, attribute names and attribute values are turned into resources, predicates and literals. While this syntax builds on the availability of high-quality XML tools, it tends to verbose serializations; in situations where RDF is to be read (and written) by people rather than machines, other non-XML syntaxes are preferred by many practitioners.

The best known of these alternative syntaxes is Notation 3 (N3),^[17] a non-XML format that produces easy-to-understand serializations that can be quickly written by hand (or reproduced compactly in printed materials). Although it is well-known, N3 is a work in progress and subject to change, and has ambitious design goals; the expressivity of N3 goes beyond that of both RDF and OWL, so an arbitrary document written in N3 might contain constructs that cannot be translated into RDF/XML. For this reason, a number of N3 variants have evolved. N-Triples^[26] is the simplest of these, and represents triples with no abbreviations such as QNames. Turtle^[27] includes the QName-based namespace and abbreviation mechanism used by N3, but restricts the expressivity of the language to match that of RDF/XML.

Finally, there are two different approaches to serializing RDF graphs by embedding them within XHTML documents; the intent with both is to expose the structured data in ordinary web pages in such a way that Semantic Web agents can recognize and extract that data for their own use. The first of these, RDFa^[28] defines a convention for expressing triples using the attributes on the elements in an XHTML document. A SW agent, on receiving a document containing RDFa markup, would first parse it as XML to obtain an intermediate representation, such as that provided by the Document Object Model (DOM), then parse this intermediate representation to obtain the encoded triples. GRDDL,^[29] the second technique, provides a method for attaching a transformation to an XML document; this transformation, typically written in the eXtensible Stylesheet Language (XSLT),^[30] can be used to extract selected information from the XML document and turn it into an RDF/XML document which can then be parsed to yield the RDF triples.

All of these RDF syntaxes have the feature that they do not define a canonical way in which an RDF graph can be written to a flat file for storage (a process known as serialization). Because a graph has no beginning or end, and no order to the edges, two implementations of the same serialization algorithm may process the triples in the graph in different orders, producing two different sequences of characters in the flat file. This complicates the process of

comparing RDF data; comparison must be performed on the graphs themselves, rather than on their serializations.

SEMANTICS

RDF has a formal semantics^[31] that defines the meaning of RDF statements by means of a model theory, an abstract, mathematical account based on the truth or falsity of statements. The goal of a model theory is that it enables the determination of the soundness and completeness of an inference process.^[32]

The RDF semantics permit certain new triples to be inferred from those in an RDF graph. The following list of inferences is not comprehensive, but rather an indicative list of the sorts of inference that RDF permits:

- Transitivity of the `rdfs:subClassOf` relation
 - (if A is a subclass of B, and B is a subclass of C, then A is a subclass of C)
- Transitivity of the `rdfs:subPropertyOf` relation
 - (if A is a subproperty of B, and B is a subproperty of C, then A is a subproperty of C)
- Inferring general properties from more specific properties
 - (if two resources are related by a property, and there is a generalization of that property, then the resources are related by the superproperty)
- Inferring membership of general classes from membership of more specific classes
 - (if a resource is an instance of a class A, and A is a subclass of B, then the resource must also be an instance of class B)
- Inferring membership of classes from domain and range constraints.
 - (if a resource has a property whose domain is B, then the resource must be an instance of B)

Comparison of RDF Schema and OWL

RDF Schema and OWL both fulfill similar roles within the architecture of the Semantic Web, in that they both support the definition of formal vocabularies for classifying entities and specifying the natures of their interrelations. The key difference between the two approaches is one of expressiveness; RDF Schema provides a concise set of primitives that are familiar to users of object-oriented modeling methodologies, but these primitives are limited to expressing explicit subclass and superclass relationships between classes and properties.

The OWL language extends the modeling capabilities of RDF Schema using a family of formal logic known as description logics^[33] in order to produce a more expressive ontology language that allows the user to specify the nature of a class in terms of the necessary and sufficient

conditions that must be met by members of that class. Necessary conditions are those which must be satisfied by all resources that are members of a class, while sufficient conditions allow an OWL reasoner to infer that a resource that satisfies them must be a member of a the class. For example, “is an animal with four legs” is a necessary condition for the class Horse (if an entity is a horse, we can infer that it is an animal and that it has four legs), but not a sufficient condition (if an entity is an animal and has four legs, we cannot be certain that it is a horse, because things other than horses will satisfy those conditions).

If classes are defined in terms of their necessary and sufficient conditions for membership, it is possible to identify the implicit subclass hierarchies that must naturally follow from these definitions. For example, if the class Quadruped is defined with the sufficient condition that it is an animal with four legs (that is, if we have a four-legged animal, then we can infer that it is a quadruped), then we could infer that Horse is a subclass of Quadruped (every Horse is a Quadruped), even though this relationship has not been explicitly stated in our ontology.

HISTORY

RDF and RDF Schema have a strong lineage which draws on the knowledge representation formalisms developed over the past 40 years. The graph-oriented triple model resembles the approaches made by network knowledge representation techniques (principally semantic networks^[34] and conceptual graphs).^[35] Although the simple class and property model of RDF Schema owes much to object-oriented approaches to software engineering, which in turn were derived in part from Minsky’s frames,^[36] RDF Schema is a purely declarative representation (unlike object-oriented models with member functions on objects, or frames with demons attached to slots). There is a further difference between the approach taken by RDF, and that taken by traditional object-oriented languages such as C++ or Java. The former is a property-centric approach, in that classes are associated with properties by defining the global range and domain constraints on the properties, while the latter is more class-centric, and defines classes in terms of the properties that may appear on objects of that category. This is largely a difference of emphasis rather than of the fundamental underlying logic, however. It should be noted that OWL takes an approach closer to that of the frame-based systems, in that classes are defined in terms of the necessary and sufficient properties that their instances must have.

The lineage of RDF in the context of Web-based knowledge representation and metadata languages dates back to the mid-1990s, with the publication of the Meta Content Framework (MCF) and the Platform for Internet Content Selection (PICS). The two languages prepared the way for RDF, by introducing a key use case (web page

description) and the notion of a triple. The first version of RDF was published as a W3C Recommendation in 1999, and this version was deprecated by a revision in 2004 which sought to provide a formal foundation for the more expressive ontology language OWL; the description of RDF in this entry is based on the 2004 standard.

PICS

PICS^[37,38] is a W3C Recommendation that was designed as a means for attaching machine-readable ratings to web pages in order to inform filtering software of the nature of the content of the web pages, with the intent that such filtering software would better be able to control the content displayed to users.

The technology emerged in part as a response to the U. S. Communications Decency Act of 1996 (Sec. 502), which effectively sought to place censorship restrictions on material distributed via the Internet. Rather than place the onus for removing unacceptable material on the publisher, PICS proposed a model whereby a potential consumer of such material could obtain an accurate description of the material that would enable them to decide whether or not they wished to view the material. The descriptions, known as content labels, consisted of values taken from some rating system, where a rating system comprised a set of independent dimensions on which an Internet resource could be evaluated. Such rating systems can be considered to be more complex versions of those used for film classification (for example, the film ratings G, PG, PG-13, R and NC-17 specified by the Motion Picture Association of America); the commonly used ICRA system^[39] specified by the Family Online Safety Institute classifies works on seven different scales: nudity, sexual material, violence, language, potentially harmful activities, user-generated content, and context.

PICS originally used a non-XML (Lisp-like) syntax for expressing content labels, with specific ratings represented by numeric values; a rating system might specify a rating category (dimension) for language, with ratings for “slang” given the value 0, “mild expletives” the value 1, “expletives” the value 2, “obscene gestures” the value 3, and so on. A content label also included information about the party that had generated the metadata, and could be digitally signed to support the verification of the identity of the rating party.

Although the practice of attaching PICS metadata to web pages was never widespread, several Web browsers implemented the standard, including Internet Explorer (from version 3.0 onwards). The principle of a standard syntax for Web metadata was a key step towards the advent of the Semantic Web, even if PICS was too tightly coupled to its application domain to serve well as a general-purpose metadata language. In 2000, W3C published a proposal for the use of RDF as the underlying

syntax for content labels, which specified an RDF Schema vocabulary for expressing both content labels and rating systems.^[40]

MCF

MCF^[41] originated at Apple Computer Inc. in 1995 as a metadata format for representing the content and structure of Web sites, and was used by the HotSauce web navigation system (a browser that allowed a user to fly through a 3D map of a Web site). The author of MCF, Ramanathan V. Guha, moved from Apple to the Netscape Communications Corporation in 1997, and reimplemented MCF as an application of the emerging XML dialect of SGML. This XML syntax for MCF has been an important influence on the development of RDF, and introduced a number of features that persist in the most recent version of RDF and its XML syntax.

The underlying model of an MCF description is a directed labeled graph much like that of RDF. The nodes in the graph can represent both literal values and objects with identity (which could be either web objects or real-world objects), and are linked by typed binary relations. Unlike RDF, it assumes that only Web-addressable objects have URLs; real-world objects are identified by non-URI strings.

RDF (1999 Version)

The original 1999 specifications of RDF^[42] and RDF Schema^[43] differ from the versions described above in three main ways. First, they do not contain a formal account of the semantics of the languages that would be suitable for reasoning. The 1999 RDF specification contains a definition of a triple and an explanation of the entailed triples produced by reification, and the RDF Schema specification informally defines `rdfs:subClassOf` and `rdfs:subPropertyOf` as transitive properties, but there is no model-theoretic account of the sort that would be needed to verify the soundness and completeness of a reasoning engine.

Secondly, they contain a number of features that were deprecated in the 2004 specification because they could not be given an unambiguous meaning. Chief amongst these features is the ability to express statements about the members of a container. Given an `rdf:Bag` containing a number of resources, it was possible to write a single triple which applied to each member of the Bag by using the `rdf:aboutEach` attribute instead of the `rdf:about` attribute to indicate the subject of the triple. While this could be seen as a convenient shorthand for expressing repetitive information, there is an unfortunate interaction with the non-closed nature of RDF containers. In the absence of a framework for provenance, it is possible for a third party to state that a container has extra members; it thus becomes possible to make the original claim about the

members of the container apply to more resources than were intended. A similar construct, `rdf:aboutEachPrefix`, allowed an author to express statements that would hold for all resources whose URIs began with a particular string. The set of triples entailed by this could not be determined without detailed knowledge of all the URIs with a particular prefix, and so the construct would therefore have unpredictable consequences as web pages were created and deleted over time. These two constructs, `rdf:aboutEach` and `rdf:aboutEachPrefix`, were included in the 1999 specification in order to support certain functionality provided by PICS, and in doing so to facilitate the transition from PICS to RDF. The 2004 specification also clarified the formal basis for reification; while the reification vocabulary remains part of the language, a triple does not entail its reification, nor vice versa.

Finally, the 2004 specifications contain a number of new constructs that were intended to bolster those constructs of RDF-1999 that were felt to have awkward consequences, but which were too widely used to be deprecated; the RDF container vocabulary was considered to be such, and was supplemented with the collection construct which enforced a well-formedness criterion on closed lists.

The RDF revision in 2004 aimed to make a number of corrections and improvements following feedback from implementers, and to complete the work on RDF Schema, which had previously only reached the state of W3C Candidate Recommendation. This new version of RDF was developed contemporaneously with the OWL Web Ontology Language, and so there was a close dialogue between the relevant W3C working groups in order to ensure that the revised form of RDF would form a suitable foundation for OWL; the earlier language DAML+OIL,^[44] from which OWL was derived, used RDF/XML as a serialization syntax but disregarded its semantics (or lack thereof) and adopted a conventional description logic semantics.^[33] An aim of the collaboration between these working groups was therefore to develop a semantics for RDF and RDF Schema that would be compatible with the semantics of OWL.

CONCLUSION

The RDF is a versatile knowledge representation language that can be used to express information about both Web resources and real-world objects. In conjunction with the vocabulary description languages RDF Schema and OWL, both of which are built on RDF, it can be used to create complex descriptions of application domains that a computer may use to infer new knowledge. The role played by RDF in the development of the Semantic Web is crucial; it integrates with the existing Web architecture to provide a common infrastructure for the creation and publication of structured data.

Saudi Arabia: Libraries, Archives, and Museums

Ayman Shabana

International Institute, University of California, Los Angeles, Los Angeles, California, U.S.A.

Abstract

This entry surveys the history of libraries and librarianship in Saudi Arabia. It traces the development of librarianship from a branch under the Ministry of Education into an independent field that has become closely tied with the Information Industry. It also briefly touches on museums, archival institutions, and library professional associations in Saudi Arabia.

INTRODUCTION

Ever since the time of Prophet Muhammad (d. 632), the region which had been known as the Arabian Peninsula acquired a lasting symbolic significance not only for its residents but also for Muslims all over the world. For the purpose of simplification, the Arabic diacritics were not used for the letters *hamzah*, *<ayn* as well as the long vowels *ā*, *ī*, or *ū*. It not only comprises the holiest sites of Islam and the places that witnessed the early formative period of the Islamic past, but its importance is reinforced continuously into the present as Muslims face the direction of the Kabah in the city of Makkah during their prayers at least five times a day. The two cities of Makkah, where the Prophet was born, and Madinah, where he died and where he established his religious and political authority, are particularly important due to their connection with the two holy shrines. In recognition of their spiritual significance, King Fahd Ibn Abd al-Aziz (d. 2005) acquired the primary title of Custodian of the two Holy Shrines.

The two shrines have always been recognized as major seats of Islamic learning. Apart from being destinations for the annual pilgrimage of all Muslims, they served as major centers of Islamic education. It was a common practice for any scholar of repute to spend some time in their vicinity to communicate with the leading authorities in the different branches of Islamic knowledge. These constant and vibrant scholarly activities have always facilitated the contact of Arabia with the outside world and also the circulation of the most important educational and cultural commodity: the book. While the political history of the region witnessed many discontinuities, disruptions and dramatic turning points, the two shrines continued to enjoy their prestige due to their strong association with the two major institutions of pilgrimage and Islamic learning.

COUNTRY PROFILE

Saudi Arabia occupies the larger part of the Arabian Peninsula, about four-fifths, in south-western Asia with a total

area of about 1.24 million mi² (2 million km²). It is situated between the Red sea and the Arabian Gulf and it is bordered by Jordan, Iraq, and Kuwait to the north, by Yemen to the South and East, and by Qatar and the United Arab Emirates to the north east. The country's longer western coastline on the Red Sea faces Egypt, Sudan and Eritrea and shorter eastern coastline on the Arabian Gulf between Kuwait and Qatar faces Iran. The larger part of the Kingdom of Saudi Arabia is arid desert. The average summer temperature in coastal areas ranges from 38°C to 49°C with high humidity. The average annual rainfall is between 100 mm and 200 mm. Arabic is the official language which is spoken by almost all the population which according to the estimates for 2007 was 24.3 million. Islam is the official religion and almost all the inhabitants are Muslims where about 85% of the population are Sunni and the remaining 15% are Shia, largely in the eastern part of the country. The capital is Riyadh.^[1] The gross national income per capita is \$22,300. The adult literacy rate for both sexes is 84% (male 88.6% and female 78.4%). Saudi Arabia is an absolute monarchy which was established by the family of Al-Saud and the current king is Abd Allah Ibn Abd al-Aziz Al-Saud. The legal system is based on Shariah-inspired Islamic law (Fig. 1).

HISTORICAL BACKGROUND

The history of the current Kingdom of Saudi Arabia goes back to 1932 when King Abd al-Aziz Al-Saud succeeded in subjugating the competing tribal rulers of the different regions and thereby bringing the entire Arabia under his rule after 30 years of constant struggle between 1902 and 1932.^[3] The claim of Al-Saud family to the rule of the region goes back to their leading ancestor Muhammad Ibn Saud (d. 1765) who consolidated his political influence by adopting the reformative teachings of Muhammad Ibn Abd al-Wahhab (d. 1792) and consequently established the first Saudi state in the Diriyah province of the central region of Najd (1744–1818). The appeal of the Wahhabi

Fig. 1 Map of Saudi Arabia.

Source: From CIA The World Factbook.^[2]

teachings was largely due to its emphasis on purifying the Islamic creed from the later accretions that crept into its basic monotheistic message. The Saudi forces were able to subdue most of the regions of Arabia and they also repeatedly attacked the border regions of Iraq and Syria. The steady advances of the Saudi forces eventually incurred the anger of the Ottoman sultan who instructed the Egyptian ruler Muhammad Ali to send his troops to subdue the Saudi-Wahhabi movement. Under the leadership of Ibrahim Pasha (Muhammad Ali's son), a strong army marched towards the Saudi strongholds and managed to defeat the Saudi forces and destroy the Diriyah. This event signaled the end of the first Saudi state. As the Egyptian forces retreated, the Saudi leaders attempted to restore their rule and eventually succeeded in establishing the second Saudi state under the leadership of Faysal (d. 1865) son of Turki (d. 1834). The second Saudi state, however, did not fare well due to the internal strife among the family of Al-Saud which led to their defeat by Al-Rashid forces. It was not until 1902 when Abd al-Aziz returned from his exile in Kuwait and defeated the al-Rashid forces, an event which marked the beginning of the third and current Saudi State. King Abd al-Aziz

(d. 1953) was succeeded by his sons Saud (abdicated 1964 and died 1969), Faysal (d. 1975), Khalid (d. 1982), Fahd (d. 2005), and Abd Allah (current King).

The political stability achieved by the unification of the region under the rule of King Abd al-Aziz facilitated the task of modern nation building. The discovery of oil during the 1930s brought the wealth that made this task possible. The oil revenues rose from \$13.5 million in 1946 to around \$212 million in 1952.^[3] During the reign of King Faysal the oil revenues reached the all time high of 92.2 billion Saudi Riyals in 1975.^[3]

LIBRARIES AND BOOKS IN THE ARABIC AND ISLAMIC CULTURE

Written manuscripts have always enjoyed outstanding prestige within the Islamic culture. Muslims were inspired by the teachings of the Quran and the instructions of their Prophet to gain knowledge which in itself was considered an act of devotion and a means of drawing near to God. Throughout Islamic history, the transmission of knowledge relied first and foremost on the communities of

learned authorities and certification was given after direct personal training under these authorities. Classical bibliographical works describe in detail the high level of sophistication that this culture of learning reached. For the larger part of the Islamic history, the various educational activities took place either inside a mosque or in a school that was attached to one. Big mosques, therefore, often consisted of compounds that comprised various educational institutions. These compounds traditionally included schools for children, schools for the general public as well as specialized centers especially for the advanced study of Islamic law and theology. Libraries or Book Houses as they were called, also started as one of these institutions that were attached to mosques. Grand mosques such as the two shrines in Makkah and Madinah, al-Azhar in Cairo, Umawi mosque in Damascus as well as other famous mosques across major Islamic cities have always comprised large libraries with rich collections. In addition to mosque libraries, schools often had large libraries that served the needs of its faculty and students.^[4]

Moreover, many Muslim rulers developed great interest in books and some of them built famous libraries that commemorated their legacy for centuries after their death. Many of these libraries started as private libraries and later turned into either public libraries or major research centers. Three institutions in particular were quite reputable: *Bayt al-Hikmah* (House of Wisdom) of Baghdad, *Dar al-Ilm* (House of Knowledge) of Cairo and the Library of Qurtubah.^[5]

Bayt al-Hikmah was founded by caliph Harun al-Rashid (d. 786). It is considered by far the first public library and academy in the Muslim World. During the reign of al-Rashid's son al-Mamun, it became the most important educational institution in the world. It was particularly famous for being the center for the translation movement sponsored and led by the Abbasid caliphs. It was geared towards translating the major works of the classical Greek, Roman, Persian and Indian thought. *Dar al-Ilm* was founded by the Fatimid caliph al-Hakim in 1004 as a rival to the *Bayt al-Hikmah* of Baghdad. The holdings of this major institution was estimated around 2,200,000 volumes which was unmatched by any other library in the world at that time. Following the example of the major libraries and learning institutions in the eastern part of the Muslim world, the caliph al-Mustansir (d. 976) founded the Library of Qurtubah in Muslim Spain which was famous for its rich and rare collection and whose index consisted of 44 big volumes.

PLANNING/LEGISLATION IN MODERN SAUDI ARABIA

With the establishment of the Central Planning Organization (1965), later Ministry of Planning (1975), the kingdom started its five-year development plans, the first of

which was during the period of 1970–1975. The early development plans focused on the development of the basic infrastructure such as the construction of roads, airports, ports, electrical and telecommunication projects. Expenditure on public education rose steadily as the allocations to the Ministry of Education (established 1953) and Ministry of Higher Education (established 1975) increased incrementally.^[6] For example the total number of students in all general and higher education stages increased from about 547,000 in 1969 to about 4.9 million in 2001. In addition to the libraries within the educational institutions (both general education and higher education), the development plans provided allocations for public libraries as well.^[7] For example, the first development plan (1970) emphasized the role of library and museum systems for the enhancement of the various educational and cultural services:

In providing for the cultural development of the Kingdom, the public library system is to be expanded and improved with priority given to enlarging the book collections and periodical sections, and providing libraries with the necessary furniture and equipment. In view of the cultural importance of archeological finds and the educational value of museums, the plan proposes to expand the activities of the Ministry of Education in this area. An annual program of archeological missions is planned for field surveys, site investigations, and site registrations. An acquisition and maintenance program has been designed to assure that buildings and landmarks of historical significance are not lost.^[8]

The plan for the Ministry of Education also provided some provisions on the public library system and archeology.

The ten general public libraries are to be expanded and improved, with priority given to enlarging the book collections and periodical sections and to providing the necessary additional furniture and equipment. A photographic department is to be established at the Riyadh Library to record documents and publications. Five of the libraries that now occupy rented facilities are to be provided with appropriate buildings through a phased construction program, and a new library is to be established in Tayf In view of the cultural importance of archeological finds and the educational value of museums, the plan includes provisions for the establishment of an archeological museum and library.

The second development plan (1975–1980) provided more specific details about the projects that pertain to the sector of libraries and museums which included the establishment of a national museum system and the development of the facilities and activities of the King Abd al-Aziz Research and Cultural institute as a major library, research, publishing, and cultural center. It also provided for the establishment of: biography center, 10 new general libraries (increasing the number of public libraries from

22 to 32 by the end of the plan), six regional museums, two Islamic museums and four specialized museums.^[8]

The third development plan (1980–^[5]) continued with the expansion of the national library and museum systems.^[8] It also provided for carrying out a preinvestment study for a National Central Library.^[8] The increased economic surplus from the oil revenues facilitated the execution of the consecutive development plans. Eventually, the transformation of life styles created more demand for cultural and recreational activities which meant among other things increased need for a robust library and museum systems as clearly manifested in the fourth development.^[8] The subsequent development plans continued to emphasize the important role that both libraries and museums play in the enhancement of the national educational system and culture in general. They also continued to highlight the need to facilitate the integration of the modern technological applications within the national library system in the light of the increasing connection between library and information sectors.^[8]

MAJOR INSTITUTIONS

King Fahd National Library

Planning for the establishment of a central national library for the Kingdom of Saudi Arabia started many years before the project finally materialized. Several proposals were made based on both theoretical and field research.^[9] Eventually, the Council of Ministers issued the resolution no. 80 on December 19, 1990 approving the statute of the King Fahd National Library and its administrative structure. The resolution was ratified by the Royal Decree no. M/9 on December 26, 1990.^[10] The articles of the Statute explained the objectives and the functions of the library. The first article provides that:

- King Fahd Library shall become the national Library of the Kingdom of Saudi Arabia and its name shall become King Fahd National Library.
- The library shall exist as an independent body.
- The library shall be linked administratively to the Presidency of the Council of Ministers.
- The headquarters of the library shall be in Riyadh.
- The library may establish branches in the Kingdom.

The second article explains the main functions of the library to be: collecting, organizing, documenting, and publicizing the intellectual and cultural output of the country. This includes, for example, collecting materials published in or about Saudi Arabia, materials published by Saudi nationals outside the Kingdom, materials of interest from outside the Kingdom, materials from outside the Kingdom that will facilitate research, study and understanding of the human culture in all its facets, and also

collecting old and rare books, manuscripts, documents, and illustrated materials, especially those that are related to Arabic and Islamic civilization. The library also carries out a wide array of activities such as:

- Processing the acquired/deposited materials according to professional standards.
- Publishing national bibliographies, union catalogs, and other documentations.
- Conducting reference studies for the Government departments and commissions.
- Providing reference and borrowing services to individuals, government departments, and the private sector.
- Organizing and hosting conferences, symposia, and book fairs.
- Representing the Kingdom in international meetings and conferences related to the objectives and functions of the library.
- Exchanging books and information with other libraries and cooperating with international organizations and associations.
- Providing leadership for the development of library services and information centers by active participation in:
 1. Preparing a national plan for the development of library and information services in cooperation with the concerned bodies.
 2. Developing national bibliographical standards and specifications in cooperation with the relevant bodies.
 3. Encouraging libraries and information centers to adopt and implement those standards.
 4. Encouraging and developing programs for investment of resources in the field of information including the establishment of an information network of libraries and information centers.
 5. Participating in the preparation and publishing of research studies, guides, directories in the field of library and information services and other areas.^[10]

In addition to its large collection of printed books and modern information resources, the National Library devotes special attention to rare items, historical documents, manuscripts, and numismatics.^[10] According to the Library's Web site, the total number of its holding until 2006 is 1,205,482. The library also contains around 30 special collections and private libraries of prominent scholars and famous personalities that include, in addition to rare books, a diverse collection of unpublished manuscripts. Some examples of these private library collections are:

- The Library of Ihsan Abbas with a collection of 8390 books.
- The library of Sheikh Muhammad Ibn Abd al-Aziz al-Mani with a collection of 5480 books.

- The library of Sheikh Abd Allah Ibn Muhammad Ibn Khamis with a collection of 7740 books.
- The library of Sheikh Uthman Ibn Hamad Al-Haqil with a collection of 17,400 books.
- The library of Sheikh Muhammad Husayn Zaydan with a collection of 4420 books.
- The library of Fawzan Ibn Abd al-Aziz al-Fawzan with a collection of 4470 books.
- The library of Dr. Yusuf Ibrahim al-Sallum with a collection of 4890 books.
- The library of the late painter Muhammad Musa al-Salim.
- The library of Sheikh Muhammad Mansur al-Shaqha with a collection of 8960 books.
- The library of Sheikh Abd Allah Abd al-Aziz al-Anqari.
- The library of Sheikh Abd Allah Ibn Umar Al-Sheikh.
- The library of Sheikh Abd Allah Ibn Muhammad al-Nasban.
- The library of Sheikh Husayn Ibn Abd Allah al-Jarisi with a collection of 4400 books.

King Abd al-Aziz Public Library in Riyadh

In addition to King Fahd National Library, there is also a number of independent educational and cultural institutions that promote libraries and librarianship. One of the most important institutions in this regard is King Abd al-Aziz Public Library in Riyadh. It was established in 1987 by the current King Abd Allah Ibn Abd al-Aziz.^[11] Its holdings include a total number of 150,000 information resources. The library functions as a major cultural center that provides a variety of services and promotes a number of educational and cultural activities especially in the areas of publishing and translation.^[11]

ACADEMIC AND RESEARCH LIBRARIES

The Saudi Ministry of Higher Education was established in 1975 to regulate and oversee university system of the Kingdom.^[6] The system comprises seven universities:

- King Saud University in Riyadh, established in 1957.
- The Islamic University in Madinah, established in 1967.
- King Abd al-Aziz University in Jeddah, established in 1967.
- The Islamic University of Imam Muhammad Ibn Saud in Riyadh, established in 1974.
- King Fahd University for Petroleum and Minerals in Zahran, established in 1965.
- King Faysal University in Dammam, established in 1975.
- University of Umm al-Qura in Makkah, established in 1987.

The organizational structure of the Saudi Universities Administration includes four main sectors: the teaching sector, the educational support and services sector, the graduate studies and research sector, and the administrative and financial affairs sector.^[6] Academic librarianship is regulated by the educational support and services sector. Each of the universities houses a central library, the largest of which is the one at King Saud University which consists of a central library and nine branches.^[9] Each university has a dean of library affairs who oversees the affairs of the university library system. Each library is run by a library director to whom department librarians report and who in turn reports to the dean of library affairs.^[9] Only the libraries of King Faysal University and King Fahd University for Petroleum and Minerals use the classification of the Library of Congress while the rest of the universities use the Dewey Decimal Classification (DDC) system.

According to a survey conducted in the late 1990s, the total number of volumes in the collections of the seven universities was 2,684,837, out of which 913,312 were in Arabic and 1,771,525 were in English. The non-Arabic collection included books in French, German, Spanish, Urdu and Hindi. Some of the problems that were found to obstruct collection development included: lack of collection building plans, managerial problems, insufficient financial support, and absence of interlibrary loan and online searching facilities.^[12] Ongoing efforts are being made to enhance the services and utilize the different Information Technology applications in the day-to-day operations of the academic libraries.^[13]

In addition to the university library system under the Ministry of Higher Education, there is also a number of higher education institutions that are affiliated with other government sectors such as:

- The Presidency for Girls' Education
- Ministry of Education
- Ministry of Health
- General Institution for Technical Education and Vocational Training^[6]

PUBLIC LIBRARIES

Libraries, archives and museums play an important role in preserving a nation's cultural heritage as well as shaping its collective memory and consciousness. This is the reason why governments often give special attention to these institutions. Modern librarianship, as an integral part of the modern educational systems, started with the foundation of modern nation states in most of the Muslim world during the first half of the twentieth century. In the case of Saudi Arabia it started with the formal foundation of the Kingdom of Saudi Arabia by King Abd al-Aziz (Ibn Saud) in 1932. Al-Nahari dates the beginning of modern libraries

back to 1945, with the establishment of the library of the college of Islamic Law in Makkah.^[6] This library was annexed to the library of the College of Education which became the central library of the King Abd al-Aziz University in Makkah, later acquired the name of the University of Umm al-Qura in 1980.

The first public library was founded in Riyadh in 1950 as the Saudi Library in Riyadh and the first modern library was established as a part of King Saud University (Riyadh) which was the largest library in the country with a collection of 398,551 multilingual volumes, 3896 serials subscription, and a large collection of rare books and manuscripts. Gradually with the tangible development of the educational system, the need for a modern system of public libraries was felt and consequently King Faysal signed a Ministerial Decree to establish the Directorate General of Public Libraries within the Ministry of Education in 1959 with the objective of fostering the development of public libraries in the country.^[6] The Directorate consisted of several departments for administration, public libraries, library services, binding, storage, photocopying and microfilming.^[14]

Researchers who trace the history of libraries in Saudi Arabia often refer to the libraries that were established by notable individuals either before or after the foundation of the Kingdom. Most of these libraries were attached to major mosques especially the two Holy Shrines in Makkah and Madinah.^[9,14] Examples of these libraries include the libraries of Sheikh Abd al-Rahman al-Sadi (1940) and Prince Musaid ibn Abd al-Rahman (1944). They also include the libraries that were established by collective communal efforts such as the libraries of al-Riyadh (1951), Shaqra (1952), al-Hariq (1953) and Hawtat Bani Tamim (1956).

The Ministry of Education's Directorate General of Public Libraries is one of the main five supervisory bodies that regulate and oversee the activities of public libraries in the Kingdom. It supervises 68 public libraries throughout the country with an average of one library in each city with the exception of Riyadh which has three public libraries. The Directorate is the major supervisory agency.

It oversees 80% of the public libraries in the Kingdom and provides the technical services for all of them including acquisition and cataloging. The collections in these libraries are classified according to the 17th edition of the DDC after its modification to suit Arabic libraries. The total holdings of these libraries exceed one million volumes (Table 1).^[14]

The second major supervisory body is the Ministry of Islamic Affairs, Endowments, Religious Preaching, and Mentoring. Some of the main libraries under its supervision are:

One of the most important libraries that are currently under the supervision of the Ministry of Islamic Affairs, Endowments, Religious Preaching, and Mentoring is the Library of Holy City of Makkah (*Maktabat Makkah al-Mukarramah*). Administratively it was under the supervision of the Ministry of Information, and then the Ministry of Pilgrimage before it finally came under the supervision of the Ministry of Islamic Affairs, Endowments, Religious Preaching, and Mentoring in 1993.^[4] This library enjoys a particular historical and symbolic significance because it was established on the birthplace of the Prophet after King Abd al-Aziz issued a royal decree for this purpose in 1951.^[15]

The third major supervisory body is the Presidency of Religious Research and Legal Responses. It supervises the Saudi Library of Riyadh which was established in (1944). Its holdings include 45,000 volumes. The fourth supervisory body is the Presidency of the Affairs of the Two Holy Shrines. It supervises the two libraries in the two Holy Shrines. The fifth supervisory body is the Darah (house) of King Abd al-Aziz. It is an independent governmental organization established by the Royal Decree no. M/45 in Riyadh in 1972. Its holdings include 29,734 volumes in Arabic and 3316 in other languages which are all classified according to a modified DDC system.

Given their symbolic importance for Muslims all over the world, the two Holy Shrines mosques in Makkah and Madinah have always received special attention from the different Muslim rulers and dignitaries across history. Because these two mosques were considered major centers of Islamic education, they have always comprised rich

Table 1 Public libraries in Saudi Arabia.

Name of library	Founder	Year	Place	Holdings
Arif	Sheikh Arif Hikmat al-Husayni	1852	Madinah	7045 printed volumes, 4373 manuscripts, and 630 miscellaneous
Mahmudiyah	Sultan Mahmud II	1855	King A. Aziz Library, Madinah	4391 printed volumes and 3314 manuscripts
Abd Allah B. Al-Abbas Mosque	Ottoman ruler of Hijaz	1874	Taif	10,000 volumes and 450 manuscripts
King Abd al-Aziz	Rushdi al-Sharwani	1983	Madinah	45,000 volumes
Public Library in Madinah	N/A	1962	Madinah	4200 volumes and 178 manuscripts
Salihyah	Muhammad ibn Uthman al-Qadi	1919, annexed to the Ministry in 1977	Unayzah	N/A

Source: From Al-Dubayan, *Itlah Tarikhiyah*, 28.^[14]

collections of books and manuscripts. Historians often speak of the different collections that were donated, bequeathed or offered to these two mosques. The Library of the Holy Shrine in Makkah was first established in 1095. Some of these collections that once existed include the collection of the Sharabiya Madrasah (founded 1233), the collection of Qaytbay Madrasah (founded 1477), the Sharawani Library (late nineteenth century), the Faydiya Library. The most famous library to be established in the Holy Shrine of Makkah was the Sulaymaniyah which was founded by the Ottoman sultan Abd al-Majid (1823–1861). Following the damage that was caused by the violent floods of 1861, the salvaged books were housed in what came to be known as the Shrine Library (*Maktabat al-Haram*). From that moment on the collection of the Shrine Library continued to grow with the continuous donations it received.^[16] The current holdings are estimated to be about 65,535 volumes and 6500 manuscripts.^[16]

Similarly, the Holy Shrine mosque in Madinah received many book collections throughout history. Some of them include the Persian collection (1184), the Ashrafiyah collection, the Mahmudiyah Library, the Hamidiyah Library, and Bashir Agha collection. Most of these collections were included in the central library that was established in 1933 and became known as the Prophetic Shrine Library (*Maktabat al-Haram al-Nabawi*). Its current holdings are estimated to be about 18,000 volumes and 2000 manuscripts.

Apart from the major governmental supervisory bodies, there are also several nongovernmental organizations that provide similar services and whose organizational structure resemble, to some extent, that of King Abd al-Aziz Library. These include:

- Dar al-Jawf established by Sheikh Abd al-Rahman Ahmad al-Sudayri in 1984. It comprises two libraries, one for men and one for women. The total number of their combined holdings is 47,063 and 103 serials.
- King Faysal Center for Research and Islamic Studies in Riyadh. It comprises two libraries. The adults' library was established in 1983 and its holdings include 37,765 volumes and 280 serials. The children library was established in 1987. Its holdings include 16,384 volumes.
- The Salihiyah Philanthropic Organization in Unayzah. It was established in 1987 and its holdings include 7145 volumes organized according to the modified DDC system.
- Library of the Cultural Center of Salih ibn Salih (for women). It was established in 1959 and its holdings include 13,685 volumes.

SCHOOL LIBRARIES

School libraries started as a division under the General Administration for Research, Curricula, and Instructional

Resources in the Ministry of Education in 1970.^[16] Prior to the creation of this administrative body, school libraries were affiliated to their regional public libraries. The bylaws of the administration states that it aims to:

- Provide the books, reference materials, audiovisual aides that serve the educational curricula as well as all aspects of educational and cultural activities.
- Encourage students to pursue the free reading and research which is appropriate for their age and aptitude.
- Train students to acquire the necessary library skills that enable them to benefit from the library resources.
- Help achieve the goals of school curricula.
- Develop literary and artistic appreciation and encourage useful entertainment.
- Serve the environment by extending the service hours to meet the needs of the students and their families.^[9]

The Administration serves as a central supervisory and executive body for all the schools under the supervision and control of the Ministry of Education. The management of the school libraries follows the local and regional administrative hierarchy of the Ministry of Education. Each library is run by the school librarian who reports to the school principal. Regional Education Districts include a body of library supervisors who oversee the activities of the libraries under their mandate and who report to the superintendent and to the Ministry. They are also responsible for conducting regular assessment and evaluation of the activities and performance of the library personnel. The books are organized according to a modified DDC System. Collection development is carried out by the central administration which undertakes the purchase and acquisition of materials and examines them before dispatching them to the regional districts. Although some of the public libraries are administratively under the Ministry of Education, the two systems (school libraries and public libraries) remain entirely independent from each other.^[9]

Special Libraries

According to a study that was undertaken in 1984,^[17] there were about 9 special libraries with collections of more than 5000 volumes. There were the libraries of ARAMCO in Dhahran, Institute of Public Administration in Riyadh, Saudi Arabia Consulting House in Riyadh, Educational Data Center in Riyadh, Industrial Studies and Development Center in Riyadh, Ministry of Planning in Riyadh, Saudi Arabia Airlines in Jeddah, King Abd al-Aziz Research Center in Riyadh and Information Center at the Ministry of Finance in Riyadh. In addition to these libraries, there were other small government and corporate libraries such as: The Department of Investigation and Public Security, 738 books and 8 serials; Saudi

Arabia Industries Corporation, 700 books and 80 serials; General Organization for Social Insurance, 598 books and 5 serials; Chamber of Commerce and Industry, 586 books and 26 serials; Ministry of Public Works and Housing, 520 books and 195 serials. All these libraries are in Riyadh. The three libraries of Jeddah Broadcasting, Ministry of Petroleum and Minerals in Riyadh, as well as Saudi Arabia Standards Organization use the Universal Decimal Classification system. The other libraries use the DDC system.

LIBRARY EDUCATION AND TRAINING

Library Education in Saudi Arabia started its first program in the academic year of 1973–1974 in the department of Library and Information Science in the Faculty of Arts—King Abd al-Aziz University.^[17] This program offers bachelor, master, and Ph.D. degrees. It started as a regular department but later adopted the credit hours (semester) system.^[18] Undergraduate students need to successfully complete 134 credit hours in order to receive their degree in four years of full-time enrollment divided as follows:

- University compulsory requirements (14 hr)
- College compulsory requirements (11 hr)
- College selective requirements (15 hr)
- Department compulsory requirements (38 hr)
- Department selective requirements (40 hr)
- Other departments compulsory requirements (10 hr)
- Other departments selective requirements (6 hr)

After finishing the bachelor's degree, students can enroll in the masters program after taking an entrance exam. Students with B.A. in library science are required to finish 36 credit hours and students from other fields are required to finish 46 credit hours. Out of the total credit hours, 6 hr are designated for the master's thesis. Upon successful completion of the M.A. degree, students are eligible for admission into the Ph.D. program which requires a total of 47 credit hours out of which 20 are designated for the Ph.D. dissertation.^[17]

The second program started in the academic year 1974–1975 with the establishment of Library and Information Sciences Department at Imam Muhammad Ibn Saud University. In addition to its focus on general library education, the program offers special training in manuscripts and other heritage-related literature. The program offers a bachelor degree of arts in library science for which students have to complete 174 credit hours divided as follows:

- Library science courses (118 hr)
- Religion, language, education and other courses (56 hr)

The department offers also a postgraduate diploma in library and information science for which students have to complete 20 credit hours and recently started also M.A. and Ph.D. programs.^[18]

The third academic program started in 1986–1987 with the establishment of the Library and Information Science in the College of Arts at King Saud University. The program offers two main specializations upon the completion of the program's core courses: library science and information science. The department's bachelor of arts degree requires the completion of 120 credit hours divided as follows:

- University compulsory requirements (15 hr)
- College compulsory requirements (13 hr)
- Elective compulsory requirements (6 hr)
- Departments compulsory requirements (27 hr)
- Specialization compulsory requirements (47 hr)
- Minor field compulsory requirements (12 hr)

The fourth academic program started in 1987–1988 with the establishment of the Library and Information Science Department in the College of Social Studies at Umm al-Qura University. For the bachelor degree, students have to complete 130 credit hours divided as follows:

- University compulsory requirements (18 hr)
- College compulsory requirements (12 hr)
- Elective compulsory requirements (12 hr)
- Departments compulsory requirements (40 hr)
- Specialization compulsory requirements (30 hr)
- Minor field compulsory requirements (18 hr)^[17]

The fifth academic program is in the department of Library and Information Studies at the Girls College of Arts. The bachelor degree requires 190 credit hours divided as follows:

- Library science courses (107 hr)
- Religion, language, education and other courses (83 hr)

In addition to these five academic programs, there are other institutions that offer training programs in librarianship. The most important program is offered by the Institute of Public Administration. The program consists of two-year training leading to a diploma in library. Similar long-term and short-term programs are offered at the College of Education of King Saud University as well as the Central Library in Riyadh.

Although these programs produce hundreds of graduates every year, recent surveys indicated that the overall quality of the programs is not up to the desired level. These programs were found lacking in many critical areas mainly because they were not updated for many years. They do not offer ongoing training or training in modern

trends in the field due to shortage of adequate resources and facilities.^[19] Many institutions started offering continuing education in the form of courses, workshops, short courses, seminars, conferences and online support in order to help library professionals keep up with users' needs, demands and expectations in a rapidly changing information landscape.

Despite the numerous constraints that the library and information science training faces in Saudi Arabia^[9,17] efforts are being made to modernize the system and cope with the fast-paced changes in the field. For more information about the Arabic Union Catalog, see the Web site of King Abd al-Aziz Public Library in Riyadh.^[20] Special attention is devoted to create a robust education system which is indispensable for producing a well-trained and highly qualified manpower for the country. Most early Saudi library professionals and faculty received training abroad, especially in the United States, Britain and Egypt respectively. See the deliberations and the minutes of the establishing meeting of the Federation that took place in Qayrawan, Tunisia, January 19, 1986.^[21]

ASSOCIATIONS AND JOINT PROJECTS

Arabic Union Catalog

The project of Arabic Union Catalog was launched by King Abd al-Aziz Library in November 2006. It aims to create a unified cataloging system that serves as a platform for all the Arabic-speaking countries in the areas of cataloging and bibliographical standards. The Union seeks to perform the functions of projects such as OCLC or WorldCat but on a regional level. The project aims to:

- Include all the Arabic information resources in a single standardized database.
- Unify the efforts in the area of Arabic cataloging and share a single catalog by all the professionals.
- Reduce the cost of cataloging and bibliographical duplications.
- Promote cooperation and collective initiatives in publishing and circulating Arabic information resources both regionally and internationally.
- Support the Arab researchers.
- Encourage and Facilitate scientific research.
- Facilitate the process of collection development in the Arabic libraries.

Currently, the project includes more than four million bibliographic records that has been prepared according to the most up-to-date standards and that can be easily shared or downloaded by the any of the participating institutions. The project has more than 40 participating institutions most of them are located in Saudi Arabia. The project also includes other participating institutions that are based in

United Arab Emirates, Kuwait, Oman, Qatar, Lebanon, Jordan, Algeria, Morocco, and France. Most of these institutions are University libraries but there are also a number of public libraries as well as research organizations.^[21]

The Arab Federation for Libraries and Information

The Arab Federation for Libraries and Information (AFLI) was founded in 1986 and has members from 20 Arab countries.^[22] Among other things, the association aims at strengthening the ties between the national libraries organizations and preserving the written, oral and visual heritage of the Arab world. The Federation publishes a newsletter, *Sada al-Ittihad* (the echo of the federation), in Tunisia which started its first issue in June 1995. The Federation also started a new scholarly journal which is published in collaboration with King Abd al-Aziz Public Library *Ialam* whose first issue was published in October 2007.^[8]

Arabian Gulf Chapter of the Special Library Association

It was established with the goal of providing an opportunity for Library and Information professionals in the Gulf area to interact and share professional knowledge and experience. More than 150 professionals participated in the inaugural conference that was held in January 1994.

ARCHIVES AND ARCHIVAL INSTITUTIONS

One of the most prominent themes that have been emphasized in the different national development plans is the "desire to maintain a national Saudi identity rooted in Arab and Islamic civilization."^[23] The plans also seek to take advantage of the modern advances in science and technology in all fields. These two goals capture the tension that the Saudi government, like other Arab and Islamic governments, has to contend with. It seeks to preserve its cultural heritage without falling behind the rest of the world. The fifth development plan speaks about heritage as "the authenticity deriving from the security of firmly established cultural roots, which in the case of Saudi context, are founded on Arab and Islamic civilization giving our contemporary culture its own unique identity and endowing it with an ability to withstand attack or undesirable influences."^[24]

One of the important ways to maintain this heritage and to preserve this cultural and historical identity is through museums and archives. Although the plans do not provide specific details on these institutions or their activities, they include however general statements that reflect the government's support for these activities. They also speak about the importance of cooperation between the government and the private sector in this area. For example, the

Fifth Development Plan recognizes the efforts of organizations such as King Faisal Center for Islamic Research and Studies as well as King Fahd Library and museums.

The National Center for Documents and Archives is the formal archival institution in Saudi Arabia. It was founded by the Royal Decree no. (M/55) in 1989. Administratively, it is affiliated to the Council of Ministers and is supervised by its chairman.^[24] The center aims to collect, classify, and store documents and to facilitate their retrieval. The center drafts the policies that regulate the preservation and the circulation of all types of government documents. It coordinates the preservation activities among the different government agencies inside the country and cooperates with similar institutions on the international level.

One of the most important archival institutions in Saudi Arabia is King Abd al-Aziz Foundation for Research and Archives. It aims to preserve and document the history, geography, as well as the literary and cultural heritage of the Kingdom of Saudi Arabia and other Arab and Islamic countries. The foundation was established by the Royal Decree no. (M/45) in 1972. For more information, see the Web site of the Foundation.^[25] Other than the library, it includes many different departments for renovation and preservation of historical items, public affairs, research and publication, journal of the foundation, archive for photographs and documentaries, geographical information systems, manuscripts, documentation of the history of the Saudi Royal family, historical Documents and oral History.

Its documentation center is one of the most important historical and archival institutions in the country. It collects and preserves all types of documents that relate to the history of Saudi Arabia. It holds a rare collection of original as well as copies of important historical documents that include correspondences, deeds, contracts, formal letters, decrees, statements, and reports. The collection includes more than 1,400,000 national and regional documents. It also includes other important documents from foreign archives that deal with the history of Saudi Arabia such as the Ottoman, American, British, French, Dutch, German, Indian, Russian, and Italian archives. The center collaborates with major international organizations in the area of renovation and preservation of rare historical documents such as the Library of Congress, the International Council on Archives, the International Federation of Library Associations, and the UNESCO.

MUSEUMS

According to the directory issued by the Undersecretariat of Archaeology and Museums in the Saudi Ministry of Education, there are more than 50 museums in different regions of the Kingdom (Table 2).^[26] For the museums in Jeddah see the directory posted on the municipality's Web site.^[27] These museums can be classified into five main

categories: archaeological and historical museums, educational and academic museums, scientific museums, popular and cultural museums and private museums. They range from large state-of-the-art museums to small-scale local and private museums. Some of the important museums listed in this directory are:

The most important museum in Saudi Arabia is of course the Saudi National Museum in Riyadh which was inaugurated in 1999. It is located at the eastern side of King Abd al-Aziz historical compound. It is built on an area of 17,000 m² and the total area of its two story structure is 28,000 m². In addition to places for exhibits and shows, the museum includes 8 main halls which display various objects and artifacts that represent the different historical stages of Saudi Arabia. The general themes for these halls are: man and the universe, ancient Arabian kingdoms, Pre-Islamic phase, early Islamic phase, Islam and Arabian Peninsula, 1st and 2nd Saudi states, Unification of Saudi Arabia, Pilgrimage and the two Holy Shrines.^[26]

Another important museum which is also located in the city of Riyadh is the citadel of al-Masmak which was turned into a museum in 1995. It has special historical significance for its connection with the events that influenced the rise of the Saudi state. The capture of the citadel by the young emir Abd al-Aziz Ibn Abd al-Rahman in January 1902 marked the reestablishment of the supremacy of the Al-Saud family over the city of Riyadh. It includes several exhibit halls that depict the different stages of the Saudi family history and recounts the story of the unification of the Kingdom under King Abd al-Aziz.^[28]

The Museum of the Two Holy Shrines in Makkah illustrates the history of the two holy sites. It includes seven main halls with each focusing on one general theme as follows: The Hall of the Entrance, The Hall of Holy Mosque of Makkah, The Hall of Kabah, the Hall of Photographic Pictures, The Hall of Manuscripts, The Hall of Zamzam Well and The Hall of the Holy Mosque of Madinah. It includes numerous collections of old and recent large-scale photos as well as maquettes of the Two Holy Shrines. It also includes many items and artifacts from these sites across the different historical eras.^[28]

CONCLUSION

The successive Development Plans continued to both reflect and drive the steady advances in the different sectors of the Saudi economy. The growing economic surplus from the oil revenues has facilitated the implementation of these successive Development Plans. Librarianship aided by the modern applications of the Information Technology has made great strides. The demand for libraries and other cultural institutions such as museums and archives is increasingly on the rise because of the remarkable

Table 2 Museums in Saudi Arabia.

Name	Type	Region

demographic changes that the country has witnessed in the past few decades. For example, the number of schools and colleges has increased from 3283 in 1969–1970 to 22,770 in 1999–2000. Consequently, the total number of teachers increased from 231,000 to 3,548,000 and the total number of enrolled students in the different educational institutions increased from 547,000 to 4.8 million during the same period. Also, the number of students who completed their university degrees both at home and abroad rose from 808 to 42,950 during the same period.

Like many other Muslim countries, Saudi Arabia is striving to preserve its historical heritage but also to catch up with modern education and technology. In the modern period and with the initiation of national development plans, librarianship has initially been attached to the Ministry of Education but gradually it has been developing its independent identity. Many national organizations such as King Fahd National Library and King Abd al-Aziz Foundation for Research and Archives are actively engaged in the process of shaping this identity. Through national, regional, and international programs they are striving to further enhance the field. The early Saudi Information professionals received their education and training abroad

but with the establishment of academic programs in national universities much of the undergraduate and even graduate education is currently being provided at home. As many researchers already observed, the field still faces many challenges that often accompany the localization of technology and standardization procedures.

ACKNOWLEDGMENTS

I would like to thank Prof. Mary Maack for her insights and useful feedback. I would like also to thank Mr. David Hirsch for his helpful comments.

Scholarly and Trade Publishing [*ELIS Classic*]

Richard Abel

Portland, Oregon, U.S.A.

Abstract

Richard Abel developed vast experience in the publishing and library communities, and brings great perspicuity to his discussion of the publishing industry. In 2008 he received the Jack D. Rittenhouse Award from the Publishers Association of the West. An announcement of the award states: “Richard worked in a bookstore, became a bookstore owner, started a private press for limited edition books, founded a company that grew into an international library distributor, founded a book marketing and distribution company, started a trade publishing company that has grown into a well respected mid-sized publisher, and is the author of numerous articles and a forthcoming book.” [<http://www.against-the-grain.com/d/taxonomy/term/26>]

—*ELIS Classic*, from 2005

INTRODUCTION

This entry is intended to focus on the place of the “trade” in the transmission and dissemination of knowledge, literature, and information in the society. The term the “trade” has long been the shorthand referent to book and journal publishers, book wholesalers, journal agents, retail bookstores, specialist booksellers to libraries, and out-of-print (OP) dealers. Various elements of the trade are integral partners with libraries as the originators and/or suppliers of books, periodicals, and related services. Book and journal publishers are the key players in the trade as they first produce the books and journals, which come to rest on the shelves or in the computers of libraries. As the originators of the knowledge/literature/information packages stored and circulated by libraries publishers stand at the beginning of the process, which results in the dissemination of the material embodiments of ideas, bodies of knowledge, and research findings. (Some may argue, and in substantial measure correctly, that authors stand at the beginning of this creative process, but such commentators fail to understand the role that publishers play in not simply providing the means for authors to make their work available in the marketplace of ideas but in seeking out, stimulating, encouraging, assisting in the writing, and editing their work to get it to and make it most useful to readers.) By virtue of this role of origination in the intellectual and creative process of knowledge and information formation, the present standing and condition of publishing is of substantial interest to librarians and information specialists. This entry does not have as its burden an explanation of the processes and practices of the publishing trade. Rather, its intention is to inform readers of the present trends and problems faced by publishers internationally and how the present state of publishing may affect libraries.

Any effort to provide a statistical portrait of the trade is so marred by inaccuracies as to make such a representation virtually meaningless. The wide differences in the numbers provided by various agencies for a specific year in a specific country not only befuddle veterans of the trade but also simply confuse outside observers. It is a matter of some irony that a trade dedicated to the origination and dissemination of knowledge and information possesses so little information about itself. Probably the most reliable source of statistical information about the U.S. book trade is the Book Industry Study Group. They estimate the total dollar sales of books in the United States is \$26,000,000,000. The reader will quickly note that the individual sales of any number of large corporations exceed the total of sales of all classes of books published by all publishers in the United States. To use a boxing metaphor: “The trade punches above its weight” in terms of setting the cultural agenda of the United States.

THE MAJOR PRESENT TRENDS MARKING PUBLISHING

Several worldwide trends mark, and have marked, the book and journal publishing trade in recent decades. The first is the continuing increase in the number of new titles issued. This trend is really only a continuation of the trend, which began with the invention of printing and has continued ever since, save for the occasional short periods of leveling off attributable to major wars. However, since World War II the rate of increase virtually the globe around has accelerated to an incrementally higher annual rate. In earlier centuries, this secular growth in new book titles could be attributed to the roughly parallel increases in literacy—first in Europe and North America and

subsequently in the other major regions of the world. Indeed, increases in literacy quite closely track increased economic well-being across entire countries and regions. Economic well-being, in turn, generally correlates with not only increased personal income beyond sheer creature needs and increased leisure but job markets depending upon ever larger percentages of more highly skilled jobs. All these consequences, of course, contribute to the desire and need to allocate increased percentages of wealth to reading for increased comprehension, augmenting skills, and filling leisure time in a satisfying way.

Inextricably linked to this growth in book readership is the second observable major trend. That is the globalization of reading interests. This is to say that some titles come to enjoy a near-global readership. This concentrating of readers' taste is served not only through the sale by the original publisher of coeditions to publishers in other countries employing the same language or through the sale of translation rights, but also by the globalization of publishing firms. Although the sale of coeditions and translation rights is a universal practice, and the numbers of titles involved is rapidly growing, the largest fraction of such transactions involve titles published by English-language publishers.

In parallel with this widespread interest in writings originating in English-language countries, the English language has become the principal language of scientific, technical, and medical (STM) writing/publishing, as well as the language of much other scholarly writing/publishing, throughout the world. STM publishing represents about 10% of total book sales in the advanced countries but markedly less in developing countries.

Globalization of reading taste and subject interest based in significant measure on English language writings coupled with the near-universal use of the English language in STM publications and, to a lesser degree, in other scholarly writing/publishing, has led to the third major trend in international publishing. That is the economic concentration of the publishing trade, particularly in the advanced countries. The need to be able to successfully market a substantial fraction of any publisher's list to copublishers, translation partners, and in the case of STM and scholarly books to readers/users worldwide virtually dictates that publishers establish a presence in those countries that constitute their major markets, usually by means of acquiring existing publishers in those countries. The firms involved must possess the financial resources necessary to maintain staffs of a size consistent with the nature of such markets; the management skills to operate such geographically dispersed organizations successfully; and the financial integrity to assure partners of their capacity to fulfill the various agreements into which they enter—almost exclusively on trust, for international contracts and agreements are but at best scarcely enforceable in any way other than moral integrity. Furthermore, such firms typically seek a presence in the countries that

represent their major markets, not only in terms of the sale of the bulk of their titles but in terms of the editorial content and list-building by the acquisition of titles from writers in the countries in which they are domiciled.

The almost inevitable outcome of this concentration produces the fourth major trend, again most marked in the advanced countries where the consequences of increased economic complexity are most clearly being played out. That is the almost exponential growth of small publishers publishing exclusively in narrowly defined subject matter fields and serving fairly readily defined reader audiences. In the United States alone over 50,000 small publishing firms have been formed as documented by R.R. Bowker and *Publishers Weekly*. Such publishers are often styled “niche publishers” reflecting the quite definite outlines of subject matter and audience that they have rigorously focused on. The large, economically concentrated publishers, compelled to support a large and highly specialized staff, must necessarily seek out “big-name” authors, whether writers of fiction or writers of dense scholarly syntheses and every kind of book between these extremes. The large publishers are no longer in a position to gamble heavily on unknown authors or run many of the risks incident to the new, and often novel, hypotheses and syntheses continually being advanced in the various realms of scholarship by young scholars. Therefore, the niche publishers, often founded by editors exiting the world of the large concentrated houses, have identified a multitude of subject matter/audience interests/markets in which they can make genuine cultural contributions as well as reasonable livelihoods. Audiences are typically reached by specialized marketing programs designed to apprise niche audiences of the availability of books devoted to their subject-matter interests. To reach beyond their domestic market for their titles, they typically develop a network of other niche or small publishers in the other major markets for books suited to the specialized subject matter involved. Much trading of coeditions and translation rights is ultimately conducted within these networks. By carefully developing and employing these networks, the niche publisher can reach virtually the entire universe of authors and readers concerned with the subject matter or writings defining such niche networks.

It should be clearly articulated here that the titles classified as “trade” books and marketed by and large through the “trade” channels of retail bookstores constitute not only the most highly visible aspect of the book trade but roughly one-fourth of total book sales. The book-reviewing media and the associated publicity and “smart” talk in literary circles fundamentally turn on trade books. The world of trade books is almost entirely dominated by a handful of large, publishing conglomerates, which are usually international in scale. The same observation can be made of the small contingent of STM book and journal publishers, save only that STM books are not marketed through retail bookstores in any significant numbers. STM

marketing more closely resembles that pursued by niche publishers. It bears repeating that the trade book world, which is what the general public construes as the entire world of books, constitutes but roughly 25% of the total sales of books in most countries. (Of this 25% about one quarter are children's books.) The remaining 75% will be dealt with below.

The fifth major trend is still largely confined to the publishing trades of the advanced countries. That is the leveling off of the sale of units of books. This is to say that the total number of books purchased in the advanced countries has become virtually flat, in year-on-year comparisons, since the last few years of the last century. Given that the total number of titles continues to increase while the number of book units purchased has largely flattened out, the obvious consequence is that the sales of most titles has been declining over the past decade. The book trade economist, Fritz Machlup, first identified this trend in the late 1978.^[1] In a major review of book publishing *The Economist* noted, "... the overall amount of money that the public spends on books is no longer rising."^[2] As this trend continues, the consequences thereof, in terms of book prices, publisher economic viability, etc. have only been ameliorated by the appearance of short-run printing and print-on-demand technologies. The most likely explanation for this phenomenon is, first, that the increasing affluence of the citizens of the advanced countries has led to the formation and articulation of a markedly increased number of more narrowly and selective personal interests.

Second, as Curtis Benjamin pointed out some years ago, virtually all scholarly fields have in recent decades demonstrated what he styled a "twigging effect." This is to say that what were in the early 20th century fairly coherent bodies of knowledge, the content of which most of the scholars in those fields were presumed to have mastered and about which they were in a position to teach both the general public and new recruits to the field, have divided and redivided into increasingly narrow subfields. As the apparent pace of discovery quickened, such generalists became fewer while the numbers of "specialists" who were on the cutting edges of the newly defined subfields increased. In short, these specialties "twigged" off the trunk of the general field. These specialists spent much of their professional lives increasingly narrowly focused on narrow and specialized subfields. As they did so, entirely new subdisciplines arose bringing in their stead specialized books and journals. These specialists, in turn, concentrated most of their attention on these specialized publications to the exclusion of those in other specialties. Thus, while the number of new titles published in the general field increased the specialists mostly purchased titles in their field, thereby increasing the number of titles associated with each general field. The outcome, of course, was fewer copies of most titles sold despite the increase in the numbers of titles published.

A third factor also contributed to this outcome. Libraries have long formed a dependable and major market for books—the public libraries for "trade" books, the school libraries for supplementary "textbooks", and the university and research libraries for scholarly books. But demands on library budgets to offer an ever wider array of materials/services, most notably periodical literature; electronic products, and Internet access have increased very rapidly. The costs of traditional purchases plus this increased demand for other products/services have outstripped available funding. The inevitable outcome, of course, is that library book purchases have been held steady or reduced and so contributed to the reduction in numbers of copies sold of a larger number of titles being published.

Substantial increases in the purchasing of books remain to be realized in second and, more notably, in third world countries. Realization of these increases will depend on both economic development and the retreat of governmental command-and-control authorities from the publishing trade—just as had to occur earlier in the development of the advanced countries to free the public square for open debate occasioned by the increasing complexity of advancing societies.

The sixth major and worldwide trend affecting publishing is the explosion of electronic products and the extension of the Internet to public access, not simply in the United States but worldwide. Much has been made in recent decades of the repeatedly prophesized demise of the printed codex and the replacement of the book by first one and then another electronic product whether as stand-alone devices or some kind of Internet download. A steady stream of fiascoes and exploded hopes and the loss of quite substantial sums of money have failed to diminish widespread enthusiasm for such notions; several celebrity figures in the world of publishing have kept up the drum-beat for such alternatives.

Outcomes such as those associated with the attempted mechanization of the codex have not attended all efforts to provide electronic access to formerly printed material. A brief glance at these successful ventures and the character thereof will, in all likelihood, identify the nature of the kinds of intellectual material that can satisfactorily transit to electronic means of transmission. The most obvious and successful kind of electronic presentation of formerly printed material has proved to be the "encyclopedia" and similar "reference" materials. In short, the electronic transmission and presentation of information (think discrete bits and pieces of data) seems to work quite well for a number of users and uses. Related thereto is the still emerging electronic transmission of more complex forms of information in the shape of research reports and journal articles communicating new discoveries of discrete data. (Many libraries now prefer to receive journal subscriptions in electronic form.) What has become thoroughly evident in the last three to four decades is that information/data transits relatively readily to electronic forms.

Electronic technology has proved, on the other hand, a major boon to book publishers in the “backroom” functions of the publishing cycle. The typical journey of a writing from author to a printed book is now conducted almost entirely electronically. Writing, editing, peer-reviewing, designing, preparing electronic input for the printer, and control of the presses in the printers shop is now largely done on computers. Additionally, all warehousing billing, shipping, accounting, etc. within the publishing house is computer controlled.

Thus, book publishers are well acquainted with electronic procedures and practices. However, their repeated efforts to replace, or offer an electronic alternative to, the printed book have proved fruitless. A brief look at the nature of the book provides the obvious answer to these repeated fizzles. The difference between the miscellany of any assemblage of information/data (think encyclopedias, dictionaries, law reports, an issue of a journal, etc.) and the coherent body of knowledge or the sustained discourse of a fiction writing is a matter of human epistemology and the quite different purposes mental processes served by each. A book of knowledge or a fiction depend for their meaning and use on an extended discourse or narrative—readers must be presented with an often extensive body of evidence or the development of a story, all configured in a logical and coherent way to acquire, in at least some measure, the sense the author intended. Information gathering, by way of contrast, commonly involves simply finding a datum to serve a particular purpose defined by the immediate needs of a mental process engaged by the seeker (think a telephone number or a dictionary word or a brief chronology of the development of the computer or a library catalog entry, etc.). The discursive discourses demanded by the exposition of a knowledge concept, an ethical precept or the telling of a story are not well handled in terms of human epistemological requirements by digital devices. An entirely different epistemological process is involved in the acquisition of a datum or a body of data than is called for in the following of the line(s) of thinking involved in the transfer of knowledge concepts and precepts or the development of a story line inherent to the construction of fiction.

To cast this profound intellectual difference in an entirely other way: a base of knowledge is an absolute prerequisite not only for intelligently seeking information but is equally necessary to the rational understanding of whatever data bits are located. By way of example: imagine an intelligent person who is utterly unacquainted with financial markets. Seat this person before three networked computer screens displaying real-time financial data. The ignorant subject of this thought experiment placed in this situation will prove utterly unable to make any sense of these masses of data, despite the fact that financial data is probably the most complete and accurate body of information/data presently in existence. Only a broad and deep knowledge of financial markets and the economics

underlying them will permit a viewer to decipher this information and put it into understandable and usable form. The same thought experiment could be employed with any body of data resulting in precisely the same outcome of incomprehensibility for the unknowledgeable. In short, the epistemological realities of the human mind must needs deal with knowledge and information in quite different ways. Therefore, the successful migration of information books to electronic forms is perfectly consistent with the functioning of the human mind. The operation of the human mind equally well explains the repeated failures to adapt books of knowledge and fiction to electronic forms.

An exception to this general formulation may occur when a reader requires but a limited portion—a chapter or several pages—of a longer discursive writing. In such cases, electronic access may prove as useful as access to the printed form of the text.

The seventh major trend in publishing again relates to another player in the wider world of books, in this case booksellers. Again this trend has been most clearly played out in the advanced countries enjoying maximum retailing freedom. This retailing trend is being played out in two forms. Both forms take as their base operational objective the immediate supply of the widest possible range of titles. This trend first became evident in the form of the “super bookstore” chains. The huge bookstore stocking 150,000 to 250,000 discrete titles has been the occasional feature of a limited number of major cities for some years. However, such stores were not readily accessible to a large fraction of the population of any country. (This fact also explains the dramatic growth of direct-mail book clubs of all descriptions in the 1930s to the 1940s—they offered most of the citizenry both some information on current publishing output and the opportunity to easily purchase titles of interest.) The radical change in bookselling, which the chain superstores inaugurated, was to place well-stocked stores (75,000 to 200,000 individual titles) in all manner of market locations—even some in which small-scale, “mom and pop” bookstores had failed. The opportunities offered the reader to personally examine hands-on a broad range of books for suitability and immediately acquire any of interest were almost overnight geometrically increased. The advent of the chain superstores has provided a much larger number of readers with a service well beyond that previously available. And not surprisingly, the committed independent booksellers undertook to match the competition created by the chain superstores in virtually every aspect, from increasing the number of titles immediately in stock to providing seating and other amenities for browsers—which has, in turn, benefited readers.

The emergence of the bookstore chains has led to some quite unsustainable conclusions about their impact on publishing. Probable the most common is that the chains have furthered the purported homogenization of taste and

interest among readers and, thereby, narrowed the range of subject matters open to authors and publishers and/or lowered the levels of sophistication to which books have to be tailored. Either one or both of two lines of argument are advanced to support this cluster of related conclusions. The first, and most egregious, is that the buyers/management of the large chains exercise greater or lesser control over the publishing programs of the trade publishers. The fact of the matter is that the opinion of chain bookstore staff is occasionally solicited, e.g., when a publisher harbors some concerns with respect to the size of print run to order or again, as approximations of the quantity of a title that might be purchased when advertising and promotion budgets are being formulated. However, such inquiries are light-years apart from editorial control.

The other common causative factor advanced in support of the notion of the progressive homogenization of public taste and interest attributable to the chain bookstores is that the centralized buying employed fails to offer the full range of subject matters and writings that are available. The obvious assumption is that the chain booksellers are appealing to only the lowest common denominator and thereby lowering and narrowing the literary and cultural horizons of the reading public. The general taste and interest of the reading interests of the vast numbers of readers as documented over the centuries apparently is insufficient evidence of the fact that the chain booksellers, in step with the stocking practices of the independent booksellers, is to stock books that seem to have the potential for enjoying a reasonable sale. In short, the chain buyers are simply doing what they insist they are doing—stocking those titles that in their opinion will find a reasonable audience, even one numbering but one or two copies in most of the chain's stores.

In every age litterateurs, authors, and some publishers have found fault with the taste and interests of the general book-buying public. Thus, it is hardly surprising that the same players are leveling identical complaints but falsely attributing them to the emergence of a class of retail bookseller they instinctively dislike.

This new means of providing rapid access to a stupendous range of books in large numbers of physical locations created by the chain superstores and their independent competitors was then translated to Internet bookselling. So, it is now possible for the readers to learn of and then order books of interest from the precincts of their own home and expect, in most cases, to have the books delivered to the front door three or four days later. The databases of book titles now maintained by the largest of the Internet booksellers are, for all practical purposes, identical to the books in print of one or several countries. These large Internet booksellers have now gone a step beyond the provision of in-print titles to conducting out-of-print searches in cooperation with hundreds of out-of-print book dealers. So, the acquisition of an out-of-print title has now become nearly as routine as the acquisition of an

in-print title. Additionally, universities and other vendors have digitized a large number of out-of-print titles, most of which can be downloaded and printed out. The world of hard-to-find titles has been radically reduced.

The eighth major trend, which has emerged only in the last few years, is the extensive reprinting of titles using print-on-demand technology (POD). The POD grew out of the joining of the photocopying and computer technologies. Like all such new technologies, POD migrated through about a 20-year period of rapid, successive marginal improvements paralleled by a widening body of buyers thereby progressively reducing costs. The technology is now so effective and cheap that it can successfully compete with conventional presswork for editions of up to about 500 copies. However, perhaps more importantly, it can be economically employed for editions of 10 or so copies, assuming the original text exists in a suitable digital format. As the POD technology has been progressively improved, it has become virtually impossible to distinguish a POD volume from a printed volume. The obvious consequence is that publishers are now in a position to keep much larger and increasing fractions of their backlist in print and within the bounds of an acceptable list price. Some of the more farsighted publishers—largely niche and STM firms—are now producing a significant number of their new titles employing POD. By so doing they cannot only print quantities from digitized manuscripts more closely approximating estimated short-term forward sales but reprint in very small quantities, from the same digital format, as demand dictates.

The second largest single class of books in terms of sales is that of textbooks—typically representing 25% of total book sales in advanced countries and larger percentages in developing countries. Textbooks have a history almost as long as that of the book, whether in scroll or codex form. Indeed, Albert Kapr, presently regarded as the leading authority on Gutenberg, opines that the first book printed from movable type was the standard Latin grammar and dictionary textbook used throughout the Middle Ages and early Renaissance for instruction in the universal language of that period, the 27-line Aelius Donatus *Ars Minor* printed in Strasbourg.^[3] Since that day textbooks became an increasingly important and profitable element in almost every publisher's list. Neither the growth of literacy or learning is comprehensible save in the context of an appreciation of the central role the textbook has played in the evolution and present prominence of the culture of the West. The textbook and related supplementary readings continue today to be the principal educational tools in the shaping of the minds of the young and their induction into the mainstream of their culture, now throughout the world.

The textbook, despite its critical role in education, has for much of its history been the lightning rod of cultural conflict, thanks to this very criticality of its role—both within the West and between the West and the balance of

the world. As a consequence, the publishing of textbooks is far from the static, seemingly benign activity it is commonly thought to be. The textbook has always been the target of all manner of special interest groups seeking to impose their various agendas on education—and thereby, on the shaping of the minds of the oncoming generations. While these conflicts over the contents of textbooks erupt on occasion into the view of the larger society—one thinks, e.g., of the contests over the control of schools and textbooks, in the centuries following the Reformation—they are usually confined to the immediate and, in many ways, inbred circle of the educationists. Textbook publishers have long since seen themselves and been considered by other segments of the educational establishment as members in good standing thereof. The textbook publishers, therefore, have chosen, by and large, to accommodate these differences by steering a middle course between contending special interest groups, which often results in a quite bland editorial substance, which in turn proves of questionable educative value.

Textbook publishers, particularly those publishing college and university-level textbooks have turned to alternative forms of publishing over the past two or three decades. The first radical departure from the standard textbook was the “course pack.” The course pack is a collection of chapters from two or more textbooks all focused on a usually narrower subset of the topics typically treated in a textbook, but also commonly derived from the fashion in which professors wish to structure their instructional approach. In the most recent and radical departures from the traditional print textbook, entire textbooks and course packs are now being offered for sale in digital form as CD-ROMs or for downloading from publishers’ Internet sites.

Whatever the periodic lapses by some textbook publishers from contemporaneous best standards of knowledge content, the textbook and its publishers are so central to the passing along and maintenance of the received cultural heritage that they will continue to represent a significant and critical element in the world of publishing.

The next largest class of publishers is the STM publishers. As the name implies their editorial foci are oriented to related worlds of pure and applied science. The STM publishers range in size from international conglomerates publishing widely across the spectrum of the sciences and their applied practices to highly specialized niche publishers. Many also devote a considerable amount of capital and editorial effort to the publishing of journals in some or all of the specialties in which they publish.

Related to STM publishing, and often conducted by STM publishers, is the publishing of professional literature. As the name implies, this publishing sector serves the needs of the growing army of professionals—lawyers, accountants, and the like—and the even faster growing battalions of “experts” of all kinds, both private and public. The political, economic, and social structures and

practices of modern society, and particularly that of the advanced countries, have become so complex that all manner of specialized knowledge is now required to negotiate the tortuous corridors often imposed on the citizen by this complexity. Of necessity, the citizenry has been compelled to turn such experts for help whenever compelled to navigate these uncertain waters. So, the professional publishing sector has arisen and expanded in parallel with this growth of experts. One of the most obvious of these specialized fields is that of management to which a multitude of books are now oriented every year. At a somewhat lower and more common level are the numerous books aimed at serving those seeking entrée to and subsequently maintaining currency in one or another of the numerous skilled vocations that have accompanied the increased complexity incident to the modernization project.

The last major class of books published is that serving a religious orientation. These range from the texts of the sacred texts of the world’s religions to devotional tracts. This class represents about 10% of total book sales in the developed countries and probably larger percentages in some regions of strong religious belief elsewhere in the world. Religious publishing, while remarkably difficult to track and quantify, seems from several accounts to be enjoying a significant upsurge in numbers of publications and in terms of sales at the present writing.

In addition to the major categories of books dealt with above, there is a large and generally unquantified body of publishing conducted across the globe every year. This transient body of publishing is commonly referred to as “ephemeral literature.” The publishing of ephemera serves a multitude of purposes usually confined to the narrow, self-contained objectives of a vast array of small, special interest groups. These groups appear to be endemic to every region of the world, save the poorest and/or most remote portions thereof, and are particularly committed to the use of publication to articulate, advance, and sustain their particular interests.

PRESENT PROBLEMS

Although a shallow backwater in financial terms the publishing trade exerts political, economic, social, scientific, and, more broadly, a cultural impact of the first rank—an influence greatly in excess of its fiscal stature. This disproportionate importance in cultural consequence imposes on the trade in general, and publishers and editors in particular, an enormous professional cultural responsibility. Shabby publishing inevitably and invariably leads to shabby long-term cultural outcomes, as has been agonizingly evident and with alarming frequency in past centuries. It is all too easy for publishers and editors to seek short-term financial relief or wealth by trolling for the lowest common denominator. At least as culpable is the knowing publication of books that advance untrue

or ethically impoverished propositions. Such resorts to the dissemination of populist or dubious goods are not simply contemptible in terms of the critical role that the finest publishing tradition fulfills but culturally corrosive.

Perhaps the gravest problem presented by present publishing trends, second to the continuing extent of shabby publishing, is a fundamental cultural epistemological problem. It arises out of the growing imbalance between the increasing volumes of raw data/information published in journal or electronic form and the comparatively slighter fraction thereof being synthesized/reduced to knowledge concepts published in coherent book form. Random bits and pieces of data/information are of no intrinsic intellectual value save as they can be integrated/synthesized by savants into knowledge concepts. Individual bits of data are absolutely essential and of the utmost importance to the prepared mind, but they possess no meaning and, hence, value to a mind not well stocked with knowledge concepts or working hypotheses into which they can be fitted to support or refute a knowledge hypothesis. There are in a number of subject-matter fields of genuine importance imbalances between the numbers of research people digging out/discovering new data/information and the numbers of people involved in synthesizing these data into hypotheses, thereby weaving some form of coherent knowledge concept out of these data and integrating these concepts/hypotheses into existing bodies of knowledge. Authentic book publishers can play an enormously useful cultural role, as they have in the past, by closely and continually monitoring these imbalances and then identifying and seeking out potential synthesizers and to then encourage them to imbed their works of synthesis into a book for broad circulation—and possible falsification.

In all likelihood, the next most serious problem faced by book publishers is the continuing attrition of library budgets. Two significant deleterious consequences arise from these budgetary constraints. First, libraries are able to acquire a constantly declining percentage of the print output resulting from the still increasing output flowing from research and synthesis. These progressively diminishing budgets are additionally being expected to acquire a far wider range of materials, most notably but not confined to electronic forms. The outcome is that libraries are acquiring a diminishing fraction of an increasing intellectual output—both print and electronic. Consequently, publishers are being increasingly constrained in the performance of their cultural function. Second, libraries have traditionally been not only an indispensable support of serious publishing but a necessary and useful partner in the larger cultural “peer-review process.” In the latter role, they have long been looked to endeavor to not only weed out the culturally mediocre but to promote the dissemination of the culturally sound. Both the preservation of the good and weeding out of the mediocre are at the very best very difficult and subject to real abuse.

Obviously, the acquisition of a declining proportion of the books and journals published in both print and electronic form limits to a greater or lesser degree the effective discharge of both of these two vital cultural functions. Possibly as great a harmful consequence of the throttling of library material budgets and the resulting reduced capacity to bring books into library holdings is either increased book prices for all buyers or, in the more acute cases, the choking off of book manuscripts in publishers’ offices induced by uncertainties about viable markets.

A continuing publishing problem remains that of copyright protection—intellectual property protection. This problem is most acute in the case of STM books and textbooks. While the problem is worldwide, it is especially acute in the underdeveloped regions of the world. The books involved are most commonly those published in the English language. Although Western publishers have over the years made all manner of concessionary exceptions for the underdeveloped countries, the problem continues to evade solution. However, this problem is not confined to underdeveloped countries; the unauthorized use of the intellectual and literary efforts of others is widespread in developed countries. Since the widespread acceptance of the Internet, an increasing volume of piracy in the form of downloading intellectual property has developed in this channel as well. The consequence of these alternative methods of acquiring intellectual property yields the unintended consequences of higher prices for all books and journals for the ethical users as well as a proportional reduction in the property owner’s income.

Another of the seemingly intractable international publishing problems is the matter of publishing in languages of limited usage. The common remedy invoked to solve the publishers’ problem is to look for government subsidies to publishers. This, as any reader of John Milton’s *Areopagitica* knows, is a dangerous game at best. The continuing history of governmental intervention in the publishers’ workshop since Milton’s time simply confirms the wisdom codified by him and provides a continuing sorry account of the unintended consequences resulting from this rent-seeking solution of government subventions. A far better solution to not only this problem but opening a far larger perspective to the citizenry of such minor-language countries as well would seem to be intensive and sustained instruction in one of the world’s major languages. The economic benefits resulting from such an educational investment would likely recover the costs involved many times over.

THE FUTURE

Turning from the disconcerting matter of the problems confronting the publishing trade to the equally dangerous enterprise of trying to make some sense of the present trends in the world of culture, knowledge maintenance

and formation, and authentic publishing some of the following observations may be useful in orienting the planning exercises of librarians and information specialists.

In all likelihood the most important trend that will greatly impact the future of publishing is the continuing increase in the financial support of research, both private and public. One of the major conclusions that can be drawn from the history of the scholarship of the last half century is that the extent of our ignorance not just of our world and our natures but of the history that landed us on the shores we presently occupy is dauntingly large. While the totality of our knowledge is impressive indeed, it still falls short of that level of understanding with which all can feel intellectually and ethically relatively comfortable. This realization has driven the continued increases in support and the inevitable increased publication, as it has in the past. It seems almost certain, therefore, that the number of new book titles being published can only increase. This increase is the inescapable consequence of not simply the synthesizing of new knowledge concepts and the integration of these new concepts into the bodies of existing knowledge. It will also follow from the necessary and continuing falsifying of older, unsupportable knowledge hypotheses in light of the new knowledge hypotheses that emerge or the contradictions that appear as these new hypotheses find their place in existing bodies of knowledge. Book publishers and editors will play a crucial role in this knowledge-building process.

Preceding the falsifying of unsustainable hypotheses and the synthesizing of new hypotheses in books containing coherent bodies of knowledge is the discovery/uncovering of data/information resulting from this continued vigorous support of research. The third likely future outcome is quite how these research results will likely enter into the larger public square of discourse and debate. On present trends, this process of dissemination seems a highly uncertain matter. Traditionally, research results have been made public in the form of journal articles and research reports. The rapidly emerging technology of electronic transmission has radically altered the likely future channels of dissemination.

To come to grips with this seeming conundrum some of the leading characteristics of the uses of the journal and of the nature of the thing in itself at the opening of the new century must be noted. First, as is well understood the cutting edge of research in virtually every subject-area field is dominated by a tiny handful of key players. These key players seldom look to the journal literature for cognitive purposes for they know most of the other members of their respective invisible college as well as the avenues of research/discovery/hypothesis formation being pursued or advanced by their peers. This elite rather employs the journal for several other purposes. First, journals are used to establish priorities of discovery in the highly competitive environment of work at research frontiers. Second, the elite uses journal papers to signal to others in the invisible

college the marking off of future research avenues in an effort to foreclose competition. And lastly, of course, these movers and shakers still intend to communicate their results to the vast bulk of others in the subject field who use these results to maintain currency for the discharge of their pedagogical responsibilities.

These latter preponderant pedagogical members use the journal for quite other purposes. As noted above they use journals to maintain subject currency for instructional purposes. They are, however, also faced with the “publish or perish” employment mandate. Consequently, they tend to publish that 75% to 80% of the papers that make no contribution to the information base of their particular subject area field or are essentially meaningless. This is also the group that uses the journal literature maintaining currency in the intellectual content of their field and for verification purposes.

Turning to the journal itself the principal observation to be made is that it is, and always has been, a miscellaneous gathering of papers. As such any specific issue possesses no substantial coherence for any particular reader. Thus, the vast percentage of papers contained therein is remote from the intellectual interests of most readers. (Notable exceptions are such high-status, general-purpose journals, such as *Science* and *Nature*.)

The second, major characteristic of the journal is that it remains, in essence, a print product and as such is conceived in terms of an issue and for commercial purposes as a subscription for all the issues published within a defined period, usually a year—this for historic reason that the first journals were published as a member benefit by learned societies and so, tied to yearly dues. Thus, the present thinking remains tied to yearly subscriptions to a specific journal title. (Historically, reports are spin-offs, for they did and do not fit the journal format well.) However, the retention of this association with a yearly subscription cycle is becoming increasingly dysfunctional for the publication of research results and that of related forms of information/data as the volume of the latter continues its recent increase.

It seems probable, in light of the recent development of massive computer capacity and the escalating sophistication of management software for enormous databases, that information/data will increasingly be made available by highly defined systems, akin to the approval plan system for books and tailored to the specific needs of individual users. The ongoing operational costs of such a system will prove sufficiently small that such individual profiles can be maintained and serviced directly to subscribers' desktop computers at a very reasonable cost to the individual subscribers.

If this trend is realized an entirely new journal/report infrastructure must be created. Subscribers to such a system will probably be served by newly formed organizations serving as middlemen between publishers and users. Libraries will continue to have a role in information/data

dissemination as the middleman between publishers and occasional users, i.e., those users whose information/data needs do not warrant signing up for a sustained service.

It also seems likely that libraries, operating as stakeholders in some kind of consortium arrangement, will be responsible for warehousing/archiving these vast bodies of raw information/data until various chunks of it are reduced to knowledge concepts by library scholars. The latter are scholars devoted not to uncovering new information/data working in a research setting, but scholars working in libraries on the already discovered information/data literature to reduce it to some kind of comprehensible form—knowledge concepts and ethical precepts—which can be incorporated into existing bodies of knowledge.

The latter role of knowledge concept and ethical precept formulation/synthesis will become increasingly important as the society more fully recognizes the unsustainable disparity between information/data discovery and knowledge formation/synthesis. Consequently, librarians will be called on to play an increasingly critical role as partners in marshalling of information/data for the utilization of the library scholars who will be virtual habitués of libraries.

All of this intellectual work of synthesizing new knowledge concepts and integrating them into existing bodies of knowledge will, of course, be disseminated to the broader public in the form of sustained discourses. Manifestly, so doing will result in a marked increase in the number of books published.

All of which brings us back to library as the cultural warehouse of the culture or the memory of the species—all those seemingly old-fashioned and presently disdained descriptions of the cultural place and function of the library. It brings us back, as well, to where this entry began. The number of book titles published yearly will continue to grow as humankind seeks to better come to grips with the true and the good.

CONCLUSION

Substantial clouds of uncertainty surround publishing at this writing. The principal cloud is economic resulting from the flattening of sales and the other problems noted above. All of this uncertainty is further complicated by the yet unknown consequences of the digital revolution. Publishers have, however, had to perform their cultural role through all manner of difficulties and uncertainties. So, at the end of the day they will continue to originate books and journals as the cultural need for knowledge, literature, and information is not likely to disappear.

School Librarianship

Blanche Woolls

iSchool, San Jose State University, San Jose, California, U.S.A.

Abstract

Professional school librarians have served schools in the United States for just over 100 years. They are certified or licensed to teach in schools as a part of the education rules and regulations established state by state. Their role is to provide access to information for students and teachers, to help teachers teach and students learn. They collaborate with teachers to build curriculum and they expand the use of technology in their schools to help others navigate through the mass of information on the Internet. Studies have shown a strong relationship between the presence of a professional school librarian and a school library, which are factors in the achievement of students.

INTRODUCTION

Over the past century, the role of school librarians evolved from keepers of a book collection to providing multimedia resources, teaching information literacy in all its formats, providing electronic access to the world's information, and offering professional development to colleagues in the use of technologies and the implementation of the Common Core State Standards. Collaborating with teachers, school librarians share the responsibility of educating their students from preschool through high school, ages 4–18. Through computer access and other electronic devices, they offer training in the finding and use of information for administrators, teachers, students, and sometimes parents and the community. While school librarians continue to encourage reading and help students find books for recreational reading, they now collaborate with teachers to improve teaching and learning, helping to plan the teaching of curricular units and to evaluate student responses to the assignments. They collect data to show how school libraries are used to help improve student academic achievement. Their history is short, and many challenges remain to be overcome.

HISTORY OF SCHOOL LIBRARIANSHIP

The first trained school librarian, Mary Kingsbury,^[1] began work at Erasmus Hall in 1900. In 1903, Mary E. Hall was named to the Girl's High School in Brooklyn, and she described her library

...to realize what we mean by a "modern school library" one must see it in action... To have as your visitors each

day, from 500 to 700 boys and girls of all nationalities and all stations in life, to see them come eagerly crowding in, 100 or more every 40 minutes, and to realize that for four of the most important years of their lives, it is the opportunity of the library to have a real and lasting influence upon each individual boy and girl, gives the librarian a feeling that her calling is one of high privilege and great responsibility.^[2]

Providing school libraries and librarians had slow growth over the years until regional accrediting agencies began requiring a trained school librarian in each school. Since few districts accredited their elementary schools, it was not until the mid-1960s and the passage of The Great Society Funding with ESEA Title II dedicated to the creation and improvement of school libraries, that elementary schools created libraries and added professional staff. During this time of expansion, multimedia formats were added to the book collection.

To better describe the role, the American Association of School Librarians (AASL) through its publication of new standards changed the name to school library media specialist, but it reversed this decision in the new century. Today, some states are beginning to adopt a term used in Australia and Canada, *teacher librarian*, to emphasize the teaching role of school librarians.

The numbers of school libraries under the direction of a certified school librarian continue to grow and lessen depending upon the nation's economy. At the beginning of the second decade of the new century, the numbers are declining with some libraries closed and others run by technicians or parents. As parents and school staff become aware of the need for someone to help students become lifelong learners able to access and use information that is accurate and useful, the pendulum should swing again.

PREPARATION OF SCHOOL LIBRARIANS

In 2013, the National Council on the Accreditation of Teacher Education (NCATE) merged with the Teacher Education Council (TEAC) to become the Council for the Accreditation of Educator Preparation (CAEP). Programs in schools of library and information science accredited by the American Library Association's (ALA) Committee on Accreditation, also accepted by the CAEP. School librarians differ from their colleagues preparing for positions in other types of libraries and information agencies because of the focus on teaching and working to improve learning. The degree from an ALA program is the license for public and academic librarians throughout the United States. The school library certificate is unique to each of the 50 states because the education of children is the responsibility of each state's board of education.

Requirements for the school library certificate or credential vary; in many states, school librarians are considered to be "teachers," and they must meet the established requirements or competencies for certification to be eligible to teach in a classroom as well as meet library certification. This means they hold a teaching credential for either multi-subjects in an elementary or high school-specific subject areas. Competencies vary according to the level of student being taught so that elementary teachers may meet one set, while secondary teachers follow a different course.

In other states, a person may be certified only as a school librarian who is not required to be certified as teacher for elementary school or a subject area in a secondary school. In this case, teachers are considered to be "special" teachers—teachers of art, music, and physical education; librarians; and guidance counselors, and they are usually certified for K-12. Persons holding this specialty may not be able to remain when the specialty is no longer considered a necessity.

Moving from one state to another can require a school librarian to take additional courses. Many states allow the first credential to be given at the undergraduate level, whereas other states may require a master's degree. Further, some education agencies insist that all teachers complete a course on that state's history, whereas others may ask the person to complete requirements to teach in elementary or high school if they only hold a school library credential.

The actual certification process for most states employs one of the following three methods: passing a test, certification through the state education agency, or designated teacher training institutions. In the first method, interested applicants sit for a test designed to confirm their eligibility for the credential, and when they pass the test, they are granted the credential. If the state department is responsible, the applicant submits the required documentation directly to the appropriate state department office. Either personnel in that office or their designated evaluators match this information to the state requirements and grant the certificate or point out the deficiencies. In the last method,

a process of program approval is granted to institutions of higher education within the state. The state education agency establishes standards, guidelines, and competencies required by those who will be teaching, and each training program supplies a plan to confirm the competencies are covered in the curriculum. State agencies then send teams of evaluators to the program to confirm that they are, indeed, able to graduate school librarians who have those skills. Continued periodic evaluation ensures that the quality of education programs within the state is maintained.

Most certification programs for school librarians require courses or demonstrated competencies in reference, management, cataloging, and technology. Students must complete courses introducing them to literature for children and young adults, both fiction and nonfiction. A curriculum integration course may be required or this may be interwoven into all courses. If a student has had no classroom teaching experience, this may be required, and most programs require a school library practicum experience, working in a school library with an exceptionally good school librarian for a designated period of time. In many states, a teacher may begin work as a school librarian on a emergency certificate while finishing the requirements for the credential. Also in some states, all teachers, including school librarians, must take additional courses to keep their credentials current with regular, confirmed professional development in college courses or other experiences.

In 2001, the U.S. National Board for Professional Teaching Standards completed Library Media Standards (for teachers of students ages 3–18+). Performance-based assessment procedures have been developed, including a portfolio of practice during a school year and summer "assessment center activities." School librarians who meet the competencies determined by these procedures will become National Board Certified and as such may not only receive recognition for their accomplishments, but their salary also increases. In some states, funding is allocated to teachers to encourage their participation.

The Working Environment

The role of the school librarian may be affected by the educational requirements of the school. No Child Left Behind (NCLB) Public Law 107–110 was first proposed during the Bush administration and put in place by President Obama. It was a part of the reauthorization Title I of the Elementary and Secondary Education Act. Each state was required to develop assessments of basic skills if they were going to continue to receive federal funding. These assessments were conducted yearly at select grade levels to determine the students' annual progress in academic programs. This new emphasis on testing with some of the results tied to teacher salaries has turned education in the second decade of the new century into a test environment, leaving little time for anything but testing. Teachers are reluctant to have their students spend any time on any

activity that does not apply directly to the tests they will be taking. This has further isolated the school librarian and other teachers from offering experiences for students.

In most schools, the school librarian works alone or with an aide. In only the largest schools will a second or third professional be in place. For this reason, they are often solely responsible for the activities going on in the school library, and unless they are able to have classes come to the library under a flexible schedule, collaborating with teachers for curriculum integration is very difficult. Flexible scheduling allows the teachers and the school librarian to determine when classes, students in small groups, or even individual students may visit the library. In other cases, and particularly at the elementary level, classes are scheduled into the library to provide the requisite preparation period for the teacher.

With the downturn in the economy, some school librarians are assigned to multiple schools. An aide may be in the school when the librarian is off-campus, or the library may be closed.

School librarians may have a great deal of autonomy partially because a few in the school or district understand the role of the school librarian. In larger districts, a supervisor of the school library program may work in a central office to oversee programs. However, authority and responsibility for all teachers including the school librarian belong to the school principal. School librarians often spend a great deal of their time educating both principals and teachers on the role of school librarians.

When school librarians are technology leaders in their school, they become responsible for professional development to assure teachers are making the best use of all available technologies. The use of social media by students has made this format a challenge to teachers who can, if prepared, turn these devices into a learning environment rather than a nuisance. School librarians can help teachers prepare for this new educational opportunity.

The Librarian's Responsibility for Teaching and Helping Teachers Teach

While school librarians have been, for many years, teaching students how to locate information in the school library, the 1998 publication of *Information Power* described the new role of the school librarian to include information literacy.

Information literacy—the ability to find and use information—is the keystone of lifelong learning. Creating a foundation for lifelong learning is at the heart of the school library media program. Just as the school library media center has moved far beyond a room with books to become an active, technology-rich learning environment with an array of information resources, the school library media specialist today focuses on the process of learning rather than dissemination of learning.^[3]

This role moves beyond information literacy to the myriad of other literacies that have surfaced including business, computer, health, media, technology, and visual among others.^[4] An even more recent addition is digital literacy. All of these are a part of much that is being taught in classrooms and collaboration between teacher and librarian effectively increases the ability for students to become literate in each.

The role of the school librarian has expanded with the ever-changing technologies in the school, and with the changes in curriculum that have come into schools with programs such as the Common Core State Standards. These were developed in 2009 by David Coleman who was employed by the National Governor's Association to write curriculum standards for literacy, now English language arts, and mathematics. While these standards have not been adopted by every state, where they are in effect, teachers need some assistance in meeting the requirements. This provides school librarians with an excellent means to help teachers teach.

The Librarian's Responsibility for Teaching and Helping Students Learn

School librarians teach students how to find resources to help them learn to become information literate. When school librarians collaborate with teachers, this becomes inquiry learning and provides the student with the skills to become lifelong learners. This responsibility includes making sure those resources are available for their students and that all students have the ability and the freedom to access these resources. The ability specifies their access to technologies needed to search online; and the freedom means the librarian supports and protects the students' intellectual freedom rights. One of those restrictions, filtering, is discussed later in this entry. However, here, the selection of materials and the protection of those choices from censorship by members of the community mean the librarian has a selection policy in place and the process to follow when someone questions any item in the collection.

School Library Standards and Guidelines

Standards for school libraries were published in 1919, 1920, and 1948. It was not until 1960 that the AASL published its own *Standards for School Library Programs*. These standards and those published in 1969 and 1975 were based on quantitative numbers such as professional librarians hired for so many students and so many books per student.

In 1988, *Information Power*^[3] changed the focus from quantitative guidelines to the role of school librarians. School librarians were expected to be leaders and links between students, teachers, administrators, parents, and community, as well as providing information resources.

School librarians were assigned the responsibility for collaborating with teachers to improve teaching and learning.

The newest, *Standards for the 21st Century Learner*, continues the traditional role stating “Reading is a window to the world” as one of the nine common beliefs. The rest focuses on how learners will use skills, resources, and tools. The school librarian functions as someone who will make sure students have the key abilities needed for understanding (skills), ongoing beliefs and attitudes that guide thinking (dispositions in action), common behaviors used by independent learners in researching (responsibilities), and self-analysis strategies.^[5]

FUNCTIONS AND SKILLS OF SCHOOL LIBRARIANS

A key document to describe school librarians is found in the ALA/AASL Standards for Initial Preparation of School Librarians (2010). This document is available at http://www.ala.org/aasl/sites/ala.org.aasl/files/content/aasl_education/schoollibrary/2010_standards_with_rubrics_and_statements_1-31-11.pdf.

Because school librarians usually work alone, they are responsible for all activities, programs, and services including management, cataloging, acquisition, reference, and readers’ advisory. As mentioned earlier, school librarians are the managers of their libraries. While most of their books may come to them from the vendor with the electronic records needed for the online public access catalog, not everything comes from a vendor, so some knowledge of cataloging is required.

Teachers, students, and even parents may make suggestions for purchases for the library; but the final purchase orders are generated by the school librarian. Also, while school librarians strive to help teachers and students learn how to use online references and keep them current as new online resources arrive, this is a skill requiring constant practice and school librarians have the opportunity to use their skills regularly, making them effective reference librarians.

Another skill is that of helping their students choose books that will interest them so that they become lifelong readers. Readers’ advisory takes many approaches including book talking books for students, developing reading lists for teachers, and simply suggesting an interesting title to a student who seems to be having trouble finding something to read. To be truly successful, the school librarian must be an effective communicator, keeping current on new technologies, and being able to make sure their students have open access to information, a truly great challenge, and they must also be ready to change, learn, and grow so that their program and activities respond to the best resources for teachers to teach and students to learn. Once that program is in place, it is imperative that what is

offered and what is being consumed be reported to the people who are important in the continued support of school libraries.

Effective Communication

The first major audience for communication is the student. This may be translated into maintaining good discipline in the library to allow students to learn what they have available for them and a place to exercise their critical thinking skills. It is also being able to talk to students about their lives. In this way, they can learn of problems they may be having with their school work and how information in the library may help them overcome these problems. Because teachers have students in a classroom within a specific time frame, little opportunity may be available for students with problems to share them with their teachers. The relative freedom of the library environment often makes it possible for the school librarians to find out what is troubling students and to help them find the persons or information for the solution of that problem. The next, and perhaps in many instances, teachers must learn what services are offered and how the librarian can collaborate in making sure students learn effective critical thinking skills, becoming literate, and setting them on the path to being lifelong learners. When two professionals are working together to provide curriculum, it doubles the number of persons working with students for a single period of time. They must learn how the librarian is able to help them enhance their teaching and evaluate what students are accomplishing.

Effective communication with the principal means regular reports of interesting activities going on in the library. This can be done with written reports, but even more effective are demonstrations by students. Showing what students are achieving in their use of the library draws the school board and the community into continuing support for school libraries and school librarians. Another important service for both administrators and teachers is keeping them informed about trends in teaching and learning, the results of research reports of methods that could be implemented in their schools, and other ideas to make teaching and learning more effective. Culling the education literature to provide the best will take time, but will also point out most effectively the role of the school librarian in providing information for all.

All of these, administrators, teachers, and students can become effective advocates for the program. Showing members of local social clubs and other community groups what is going on in school libraries allows them to see the value of the school library in the lives of students. Students, teachers, and parents who visit local, state, and national government officials can explain what happens in school libraries and how their school librarian is essential in the learning environment.

Use of Technology

School librarians have been on the cutting edge of the implementation of technology in their schools. In 1915, Mary Hall reported having lantern slides, and “for the English work and indeed for German and French, a Victrola with records which make it possible for students to hear the English.”^[2] Funding in the 1960s found new media and the equipment to play and project these on the library shelves. School librarians began adding computers to the services offered in the early 1980s. The first use was for word processing and management of the collection, cataloging and circulation, closely followed by reference materials on CD-ROMs. These became quickly obsolete with access to online resources from vendors. Computers moved into the library, sometimes in a separate room, in the reference area, and where the card catalog used to stand. Students used computers in the library to write and print their papers.

Student use of computers has become so essential that some schools are providing for laptops and electronic notebooks either for a year or semester assignment or at least checkout for a time from the library. This means that no students are handicapped because their families cannot provide them with computer technology.

School librarians have been responsible for interconnecting classrooms to libraries and providing the electronic resources in the library to be shared beyond classrooms to the student’s home. When school and public librarians have a cooperative relationship, this interconnectivity may be between the public library, school, and homes. This means school librarians have become computer savvy and able to select, install, and use new technologies.

School librarians recognize the constant need to upgrade computers. With every change in software, hardware must have additional storage and a faster response time. As the hardware expands beyond the computer itself to printers, scanners, and copy and fax machines, these also must be upgraded. It is not a situation that will become easier. Also, with the expansion of the Internet, school librarians had an additional challenge of how to keep information one would not choose to have in the library, out of the library.

The Challenge of the Internet: Filtering the Internet

The opening of the Internet has provided a myriad of opportunities to search for information on the World Wide Web (WWW). With this, access to online resources expanded beyond the ability of the school librarian to monitor what information came into the school library. It was possible for students to locate pornography, hate messages, and other information that a school librarian would not select for users. Information on the Internet may be somewhat more difficult to spot than a student with an

issue of an “adult” magazine tucked into a notebook which could be permanently removed by confiscating the magazine. Websites on the Internet are much more difficult to monitor and stop their being used on a school library computer. One solution to the challenge is a filtering system for library computers.

Filters that review information being received via the Internet are available. They have several problems, one of which is that filters often keep important information from coming through; another is that a clever student can easily circumvent them. Other solutions seem to work as well or better. One is to have students and parents or caregivers sign a contract concerning the use of the Internet in the library. Not abiding by this contract can mean the student cannot use the library’s computers or access the library’s other resources. Another solution is to establish links to acceptable websites that will provide students with information that is relevant to their needs.

Even greater challenges are present with the Internet and access to the WWW: misinformation, students who find too many sources and choose irrelevant information, and those students who simply copy information. If students are looking at a screen filled with pornography, it is instantly recognizable for what it is, but the greater problem is the misinformation that can be found on the Web. Unless the librarian is seated with the student and reading what they are reading, the misinformation may go undetected until it is being corrected by a teacher.

Helping students to learn how to find the relevant, accurate, useful information from the overwhelming quantities available on the Web is another responsibility. So much information is available that it is difficult to help students sort through it all to select what they need for their research. School librarians can help students by doing some of the first searching and providing links to relevant information. This does not stop the student from simply copying what is found.

It is also far too easy to download information and reposition it within a report without thinking through the information and adding to it or taking away from it or analyzing it to create new information. At no time has the ability to plagiarize been greater. It takes strong collaboration with teachers to make sure students use their critical thinking skills to determine appropriate information and to use that information to analyze a situation and propose a solution by repackaging the information.

Perhaps the greatest challenge of all is how to help teachers learn how to physically use new electronic resources and how to integrate them into their courses. The constantly changing hardware and software, as well as the constantly changing access to new databases, can be confusing to the school librarian who works with them daily. It is even more distressing to the classroom teacher who is not so close to the situation. This means that the school librarian serves as teacher of teachers to make sure that they also keep up to date.

Ability to Change, Learn, and Grow

Changes in educational theory and methodology for teaching dictate much of what happens in schools. School librarians take responsibility for learning about new trends and methodologies and share these with their principals and their teachers. They constantly demonstrate their ability to change, learn, and grow, and this is most evident in their awareness of the constant upgrading of technologies and their willingness to teach their colleagues how to use each new technology as it becomes available. The advent of the new social media creates a challenge to teachers who do not wish to have their students use cell phones and text during class. While confiscating all cell phones may provide a temporary fix, making an educational application for these technologies so dear to all students can be a more effective solution.

Collaboration with Teachers

The school librarian has moved from the support role of providing resources for teachers and students to one of collaborating with teachers to increase student learning. School librarians plan with teachers, actively helping with the development of curriculum units. As an expert in information resources, learning styles and patterns for students, and teaching styles of all the teachers, the school librarian suggests the best methods for implementing curriculum. Expanding the classroom into the wider world of information, the librarian integrates research skills into the students' everyday questioning, helping students to learn how to judge which materials to use in their research reports, helping students with inquiry skills and increasing their critical thinking skills.

Helping teachers make the best use of the opportunities provided by the new technologies their students have readily adopted is essential. From e-mail and cell phones to texting, Tumblr, Instagram, and blogging are the ways students communicate. These will not go away because teachers ignore them or, worse still, try to forbid their use. Rather, the school librarian helps them make effective uses of these technologies.

The collaboration role does not end with helping match resources to the curriculum, the school librarian helps assess student learning. An active participant in the building of units of instruction, the collaboration continues through the evaluation process and design for the next group of students. This role is not automatic nor is it an easy one. Whenever education moves into a paper and pencil test to ascertain if children are learning, teachers move back to teaching to the test and are reluctant to take time for students to learn in ways other than rote memorization. This makes it very difficult for collaboration until the pendulum swings back and students can learn through a collaborative process which makes their learning based in the real world.

Assessment and Evaluation

School librarians have learned of the need to measure the effectiveness of their services. Many studies^[6-9] have been completed in several states showing the relationship between academic achievement and the presence of a school librarian and an adequate collection of materials.

Workshops at conferences or in the online environment suggest to school librarians that they should conduct their own research to show the value of their libraries in the educational lives of students. Articles in school library periodicals offer many ideas for how to carry out such projects. It is never easy with the demands of the school year; nevertheless, some school librarians do small studies and report the results to their school and even to the district administrators and the members of the school board.

Advocacy

School librarians remain relevant in the school when they are able to "sell" their program and resources. This begins with the development of a website for the library where new arrivals in the library or new activities may be listed. Teachers post assignments and homework with links to the library's resources as well as safe websites and databases available to complete the assignment.

It is both an education and a survival process. In the education mode, school librarians encourage teachers and students to make use of the collection to further their research and learning. New materials and new technologies available in the library itself or virtually through the library increase its importance. School librarians make presentations of new products in the library at meetings of department staff or in teachers' meetings. They provide effective bulletin boards in the library to encourage students to "buy" the products offered. They send lists of new materials to classrooms.

In the survival mode, the use of the school library must be shared with the broad community. School librarians send monthly reports of the activities in the library to their principals. They write columns in both the school newspaper, and whenever possible to the local news media. They plan and implement programs such as inviting a book author, a local politician, or a state or national legislator to the school to bring attention to the library. School librarians singly may ask their principals to invite district administrators and school board members to the school to observe an effective program outcome, or, as a group, they make yearly presentations to their school boards and provide programs about school library initiatives to their communities through their service organizations. All of this serves to help present the role of the school librarian to audiences, most of whom are truly unaware of what they should expect from their school librarian.

The Leadership Role of School Librarians

The traditional role of the person who shares books with students encouraging them to read both for information and enjoyment remains and provides resources for teachers on special subjects being taught continues to be important, but a wider role has opened.

Responsibility for audio-visual materials purchased for the library meant school librarians began to take a leadership role in integrating these new items into the curriculum. Their role expanded from helping find appropriate resources to showing teachers how to use the equipment needed to play or project those materials and even how to create new teaching aids. When computer technology became available to schools, online information became a large part of the library collection, and school librarians accepted the responsibility for teaching both teachers and students how to find information available on a variety of databases.

Today, school librarians continue to lead by presenting new uses of the Internet. They build websites where information about the school library is posted. Working with teachers, homework assignments are available for students and their parents, and the accompanying resources are linked there through bookmarked websites. Keeping up with the trends and suggesting educational uses of each new technology leads teachers into turning what might be considered a distraction into a learning tool.

As the single teacher in any school who works with all of the students, all of the teachers, and all of the curriculum all of the time, school librarians are in a unique position to help build an atmosphere of sharing across the school. When the focus is on something other than testing to determine if students are learning, teachers in all areas of the curriculum are able to work as a team to offer learning experiences which are more closely related to real life than the total separation of school tasks from the student's daily experiences. At that point, school librarians lead teachers in blending all areas of the curriculum, social studies, literature, science, math, art, music, and the others.

Compensation and Unionization

In public educational systems within the United States, school librarians are considered teachers, and as such, are on a salary scale comparable to teachers. These salaries are usually based upon years of service, coursework taken, and degrees completed. Additional stipends are paid for additional work such as staying for one or more weeks at the end of the school year to close the library and coming early to open it in the fall. A school librarian who played soccer in college may be asked to coach the girls' soccer team and receive a stipend for that.

In the second half of the twentieth century, the National Education Association (NEA) began to be challenged by

the American Federation of Teachers to represent teachers in labor relations; and the era of teacher negotiation began. One central issue was preparation time for teachers. At the elementary level, this translated into special teachers providing release time for the classroom teacher. Thus, classroom teachers walked with their students to the door of the music room, the art room, the gymnasium, and the school library, and departed. Some administrators solved this dilemma by having teachers assigned their preparation period either before the school day begins or after it ends. If no such remedy is available, school librarians can suggest a different approach.

One possibility to open the library has been using flexible scheduling, where teachers and the school librarian determine the needs of the students in use of the library and time in the library, or time for the school librarian to come to the classroom. When the school librarian has the opportunity to collaborate with teachers and the time in the library has been carefully designed, children are more interested in finding and sharing information, increasing their critical thinking skills, and setting the stage to become lifelong learners. When the release time for classroom teachers is a union requirement, alternatives must be found.

Another solution might be to have two classes in the library at the same time for book exchange and recreational reading, thereby freeing the same amount of time for planned curriculum integration. This, as with flexible scheduling, means that librarians are no longer required to provide library lessons with no relationship to what is being taught in the classroom.

For school librarians to be considered within the union contract negotiations, the most effective way to do this is to have a school librarian a member of the union negotiating team. Someone must become political enough to win an election to the union board. This will add to an already busy life, but it will be a great benefit to all school librarians in a district.

Performance Evaluation

Many states have created forms for the evaluation of teachers within that state. These have been approved by the teacher's union. They are often difficult to apply in the situation of the school librarian who is not just responsible for teaching but also responsible for managing the inventory of books and equipment found in the school library.

Tenure

As teachers, school librarians fall under the same rules as teachers. In some states, tenure cannot be granted until a teacher has a certain level of education. In others, it is a matter of being certified in a teaching area and a certain number of years of successful teaching, often as few as three.

The yearly evaluation process of teaching is a part of this tenure process. In most cases, the evaluation is done by the building principal, although a teacher or the school librarian might be visited by someone from the central district office with expertise in a particular area. Finally, tenure is granted by the governing Board of Education for the district.

Professional Development

For most school librarians as with most teachers, professional development is offered at the district level through staff development programs offered by the school district. These are effective when they are planned to meet established needs for those who will be in the audience. School librarians, with their knowledge of trends and issues in the world of education can be helpful to the principal or anyone else planning these events. Their research skills can locate experts in the field and determine the cost of the speaker. Often these district-wide sessions are directly related to curriculum content and are less related to librarianship. While many school librarians would like to attend other types of learning sessions, most have a difficult time being released to go to programs during the school day. They are seldom compensated for travel, housing, or daily expenses, and therefore do not feel they can participate. School librarians are well aware and make use of many online opportunities for them to engage in staff development without leaving their homes.

Professional Associations

School librarians have their choices of several professional associations in both the education community and librarianship and at local, state, national, and international areas. In the education world, many school librarians, as teachers, must join either the NEA or the American Federation of Teachers (AFT) through their local and state organizations. One of these will serve as the bargaining unit for the school district or the schools in the state.

Other organizations include the Association for Supervision and Curriculum Development (ASCD) and the International Society for Technology in Education (ISTE). ASCD allows school librarians to attend conferences and meet superintendents, principals, and other administrators and advocate for school libraries. ISTE offers leadership to improve teaching and learning through effective use of technology. Both ASCD and ISTE have members worldwide.

The American Educational Research Association (AERA) has a Special Interest Group (SIG), "Research, Education, Information and School Libraries." The SIG welcomes the posting of research conducted in and about school libraries.

In the library world, divisions of the American Library Association that would be of interest are the AASL, the Association for Library Service to Children (ALSC), and Young Adult Service Association (YALSA). AASL aims to provide a national audience for school librarians, and it holds a national conference every other year. Both ALSC and YALSA serve librarians working in public libraries, but many school librarians are also members of these two. Because these are national associations, travel to conferences is a greater challenge than travel to a state conference.

School librarians choose to join their state associations which are affiliates of AASL, although in some states, New Mexico, New York, and Texas, the library associations include all types of libraries. Conferences are held within the state making travel to the meeting and perhaps the registration a little less costly; yet hotels and meals will be about the same. School librarians need to join professional library associations and attend conferences whenever possible so they have these more applicable staff development opportunities.

Local groups of information professionals may have loosely organized meetings. If public or special librarians meet, school librarians should try to join them to gain support for information services for all. School librarians in a regional area who meet at least twice a year can be better able to see the challenges from one district to another. Because administrators meet regularly and learn of cost-cutting trends that may affect school librarians, the regular meeting of all school librarians in an area can serve as a warning of what may be facing them and allow for the development of ways to counteract negative actions.

SCHOOL LIBRARIANS IN THE GLOBAL COMMUNITY

Because our students are living in a global community, school librarians can help them meet their peers in other parts of the world. Students can ask their fellow students to share cultural events such as celebration of holidays, types of food, recreational activities, and their environment as a beginning. It is very easy to establish these relationships when the school librarian is a member of an international professional association.

Two international professional library associations have school librarians as members from across the globe. The International Federation of Library Associations and Institutions (IFLA) represents information professionals from all types of library associations as well as libraries and institutions. The American Library Association is an association member of IFLA while institutional membership is held by national, city, and governmental libraries, and schools of library and information science. Very few individuals join as personal members because they have

no voting privileges. Rather, they choose to be considered a member of IFLA because they are a member of one of the library associations or work in a member library. The School Library Section of IFLA is directly related to school librarians. IFLA holds its yearly meetings in different countries each year.

The International Association of School Librarians (IASL) is a smaller organization, but programming and publications are directly related to school librarians. Their activities are open to school children and how to become a part is available on the IASL website. This organization also meets yearly in countries across the globe.

School libraries with personnel, facilities, and collections are more likely to exist in the global community in those countries with the designation, “developed,” and less likely to be more than a small collection of books in a locked cupboard in the developing nations. A series of vignettes of a day in the life of a school librarian were published in the publication of the International School Librarians Association, *School Libraries Worldwide*.^[10] Longer articles provide glimpses of the duties of school librarians in Israel, Canada, South Africa, United Kingdom, Namibia, Botswana, and Australia. A series of shorter explanations are found under “International School Library Day.”

Joining an international association provides a global picture for the school librarian who can, in turn, share activities and other suggestions with teachers and students. The cost is small unless one wishes to become more active and attend conferences, but opportunities to travel to another country may just become a vacation opportunity as well as a professional development experience.

Closing

School librarians must be leaders in their schools so that when curriculum or teaching methods change and new technologies become available, they can help their colleagues make the changes needed. The role of school librarians continues to evolve. They continue to monitor the provision of information available from resources around the world and teach both their teachers and their students how to find the best possible materials to meet their needs. School librarians navigate the Internet and research databases as well as use print resources to provide access to information. School librarians will continue

to learn and grow to make sure they provide the best information available for the teachers and students and that these users know how to use the resources. School librarians are critical members of the school’s teachers if all students are going to have access to information, to have higher achievement scores, and if they are going to become lifelong users of information. Beginning more than 100 hundred years ago, school librarians provide “the opportunity of the library to have a real and lasting influence upon each individual boy and girl,”^[12] because this role is “one of high privilege and great responsibility.”^[12]

School Libraries

Blanche Woolls

iSchool, San Jose State University, San Jose, California, U.S.A.

Abstract

School libraries have a comparatively short history, but their importance in the achievement of elementary, middle, and high school students and their role in providing access to the ever-increasing information available worldwide makes them an essential component on the education scene. School libraries are essential because students need free access to information, but not all students have access to the technologies away from school and this makes information unavailable to them online. Standards and guidelines that help define the school library are presented, the effect of changes in the school environment is discussed, and an introduction is given to the research pointing out the importance of the role of the school library in student achievement. Finally, the relationship between the school library and the public library is given. While most of the focus for this entry is the United States, brief mention is made of the international perspective of school libraries in other parts of the world.

HISTORICAL CONTEXT

From the earliest published reports, school libraries were poorly funded with “... any funding allocated for school libraries was limited and sporadic and given without providing for State aid, or supervision of the selections of books.”^[1] Usually disinterested in a second assignment beyond their classrooms, teachers were placed in charge of any collection of books located in schools, allowing the so-called libraries “to sink into neglect and contempt through failure to provide regular supplies of fresh reading.”^[1]

Although book collections, perhaps identified as a school library, existed prior to 1900, it was not until then that Mary E. Kingsbury, the first professionally prepared school librarian, was appointed to Erasmus Hall in Brooklyn, New York, and professional services began.^[2] The number of school libraries grew slowly until accreditation of schools began. “Regional accrediting agencies specified a high school librarian with a trained librarian as a requirement for all schools seeking to be accredited by their association.”^[5] Certainly, two world wars and the Great Depression affected the development of school libraries until the mid-twentieth century.

The launching of *Spudnik* in the 1950s confirmed the superiority of the space program in the USSR and made the United States focus on what were considered to be serious national problems with foreign language, science, and math. Congress passed the National Defense Education Act (NDEA) that provided matching funds to school districts to purchase materials to improve these areas of the curriculum. Later, these funds could be spent for almost any materials in the school library as well as all types of multimedia and the equipment to play or project these. When schools had a library and a professional

school librarian, many of these materials became part of the library collection and the library moved beyond a collection of books.

In the 1960s, a concerted effort was made to point out the lack of facilities, collections, and personnel in school libraries. Mary Helen Mahar’s 1964 national report on the status of school libraries pointed out that “46.3 percent of the public schools of the survey had centralized libraries in 1960–1961. Of the school grade levels, elementary schools had the lowest percentage with centralized libraries—31.2%.”^[3]

With the concentrated efforts of school librarians nationwide, Congress provided one part of the Great Society Funding for ESEA, Title II. With this dedicated funding for the purchase of library materials for school libraries, school districts began to hire professional staff to manage libraries, to remodel or expand existing facilities, and to select new resources such as multimedia. Children at all levels now had access to information in their schools, and school librarians could work to meet standards and guidelines.

The expansion of school libraries continued until the 1980s when the downturn in the economy saw much of the steady growth come to an end, and, in some cases, losses in funds for collection building as well as losses of staff and professional positions. The development of micro-computer technology while increasing access to information and providing new management tools placed an additional burden on the school librarian who saw the limited funding previously allocated for library materials being diverted into the purchase of this new technology.

At the end of the twentieth century, the introduction of affordable computing for library management saw the creation of networks and consortia, especially in the creation of online access catalogs. These databases expanded the sharing of resources through interlibrary loan.

The use of a variety of technologies affordable to schools, including scanners, fax machines, and the Internet allows the transmission of information electronically and seamlessly making the school library an essential part of each student's school life and is critical for those students who do not have access to these technologies away from school. School districts may provide notebooks or laptop computers for each student to take home or in other schools, students must depend upon finding these in their school libraries.

STANDARDS AND GUIDELINES

School library standards and guidelines provide models for developing programs, services, and facilities. The first guidelines^[4] for school library services were developed in 1919 by a committee of the National Education Association. They outlined staffing, collection, and facilities for high schools. The companion standards for elementary school were published in 1925.^[5] Both differentiated between the services offered in a public library and the role of the school library within a school.

The 1945 standards,^[6] the first published by the American Library Association (ALA), were not given much attention as school districts faced the challenge of providing classrooms and teachers to accommodate the large number of children entering schools. However, they did help to create the foundations for those new guidelines that followed.

In 1951, the members of the Children's Services Division of the ALA who worked in schools began the American Association of School Librarians (AASL) as a separate organization. This newer division within the ALA, published their first *Standards for School Library Programs*^[7] in 1960, helping to launch a decade of development made possible with the increased funding.

During the unprecedented growth period of the 1960s, the AASL published their second *Standards for School Media Programs*,^[8] in 1969. The next guidelines, *Media Programs: District and School*,^[9] were published in 1975. All three documents used quantitative requirements for all aspects of the library. By 1975, the new standards were given little attention because redirection of federal funds and the reduction of local funding for schools found school library positions and collections in jeopardy.

Members of the AASL had hoped to produce new standards every 5 years. However, it took them almost 15 years to produce the next edition. In 1988, *Information Power*^[10] changed the focus from quantitative guidelines to a statement of the role of the school library from the standpoint of the building level program. Rather than using what appeared to be an arbitrary establishment of quantities to what constituted an adequate number of staff, collection, facilities, and equipment, a survey of actual school libraries allowed the standards committee to use

information gathered from exemplary elementary, middle/junior high schools, and high schools. School personnel could now match their programs to real-life situations and see how closely their programs met or exceeded those reported in the high-service programs using the results as an indication of their own level of achieving excellence.

The 1998 publication of *Information Power*^[11] came after a decade of change in both educational systems and the school library program. Students began to look for information beyond what they could learn in the classroom, and the school library was able to provide access to the constantly increasing wealth of knowledge. "*Information Power* approached this twofold growth by advocating the creation of a community of lifelong learners. Information literacy - understanding how to access and use information - is at the core of lifelong learning."^[11] These standards included nine information literacy standards defining the student who is information literate, the student who is an independent learner, how the student who is an independent learner is information literate, and how the student who contributes positively to the learning community and to society is information literate.

In 2008, new standards were developed for school libraries and the focus is entirely on the student and what the student can learn. *Standards for the 21st Century Learner* will ask school librarians to help "learners use skills, resources, & tools to:

- Inquire, think critically, and gain knowledge.
- Draw conclusions, make informed decisions, apply knowledge to new situations, and create new knowledge.
- Share knowledge and participate ethically and productively as members of our democratic society.
- Pursue personal and aesthetic growth."^[12]

The final document described the learner's skills, dispositions in action, responsibilities, and self-assessment strategies. They are based upon nine common beliefs:

- Reading is a window to the world.
- Inquiry provides a framework for learning.
- Ethical behavior in the use of information must be taught.
- Technology skills are crucial for future employment needs.
- Equitable access is a key component for education.
- The definition of information literacy has become more complex as resources and technologies have changed.
- The continuing expansion of information demands that all individuals acquire the thinking skills that will enable them to learn on their own.
- Learning has a social context.
- School libraries are essential to the development of learning skills.

When standards and guidelines such as these are developed by professional organizations rather than government agencies, their implementation remains voluntary. It remains the responsibility of school librarians and supporters in the school and community to gather support for them. The new AASL standards explain a philosophy and place the responsibility for implementation on the school librarian working with teachers and are written to have an increasing impact on the education of students.

Government agencies in individual states may publish official standards and they are, in effect, laws. Because of this, these agencies are aware that they will be asked to provide adequate funds if such regulations are expected to be met. Therefore, those standards usually have such low numbers so that most schools can meet them.

Government agencies may also state the number of school librarians per school or per number of students. Again, these often place responsibility upon school districts that have inadequate sources of funds to hire the number or personnel. Most regulations have clauses that allow school districts to use a different route to providing overseeing of school library programs.

CHANGES IN EDUCATION THEORY AND PRACTICE: EFFECT ON SCHOOL LIBRARIES

Constant efforts to improve the education of students result in continual restructuring of schools, rearranging the school day, week, and even year, all under definition of educational improvements sometimes within the curriculum offerings. Changes are implemented, often without adequate research or testing. Prophets gather disciples who accept the pedagogy espoused and put it into practice, sometimes reporting that this change is successful with little or no concrete evidence. The process is similar to a small flame in dry grass; a little wind moves the fire through the land with incredible speed, often leaving behind an utter wasteland. One example of this was the new math movement in the last century. In-service sessions were provided and school teachers were required to attend. At the elementary level, teachers who were weak in math often did not understand the concepts. Parents could no longer help their students with homework, and it slowly faded away. Some of these have more direct effect upon the school librarian. The rearrangement of the school day, week, and semester reflects some of these attempts to improve learning.

With block scheduling of classes, teachers and students move from the pattern of 45-minute daily classes into longer periods of time each day for single subjects and a different pattern of subjects throughout the week. When teachers have a longer time with a single group, it provides the opportunity to work with the librarian to schedule and monitor the research process. Furthermore, students who want to conduct research have a longer time to work in the library without interruption.

Year-round schooling is another innovation, and this varies in choosing how to schedule the year. Sometimes, teachers and students attend on a rotation with different students and teachers occupying the same classrooms depending on the schedule. In others, the school remains closed when students and teachers are not in class. Another model has been to schedule the number of weeks in attendance throughout the year with longer breaks between each school term. In the first case, rotation of teachers and students means the need for additional staffing in the school library.

Changes in practice may come from organizations related to education, and this sometimes has government support supplying further initiatives and implications. Efforts by educators to implement the national program, No Child Left Behind, have turned teaching into total focus on test results. Because salary increases for teachers and funding for schools may be unduly influenced by test scores, teachers now teach students only things that will help them achieve high test scores. It has made a serious impact on the relationship between teachers and the school library and upon the use of the school library as a learning environment. When teachers revert to teaching only what they understand will be on the test, they are not willing to spend any time on research in a school library.

Another innovation has been the Common Core State Standards (CCSS). In 2009, David Coleman was employed by the National Governor's Association to write curriculum standards for literacy, now English-language arts, and mathematics. These have not been accepted by all states, and some states have only adopted some of the standards. The stated purpose of this initiative "is to provide a consistent, clear understanding of what students are expected to learn, so teachers and parents know what they need to do to help them."^[13]

The CCSS Initiative is a state-led effort coordinated by National Governors Association Center for Best Practices (NGA Center) and the Council of Chief State School Officers (CCSSO). The standards were developed in collaboration with teachers, school administrators, and experts, to provide a clear and consistent framework to prepare our children for college and the workforce.^[13]

The CCSS initiative has provided an opportunity for school librarians and the library to offer support to teachers who do not understand the concept or who seem unable to move into the requirements. School librarians can be very helpful in conducting professional development to help understand the program and to work with teachers to build the school curriculum.

NEW TRENDS: LEARNING COMMONS AND MAKERSPACES

One of the newest trends has been the remodeling of the library space into a more open area. As reliance on digital

information increases, the need for book shelving has decreased allowing for repurposing use. In some cases, it became a newly created space. Most often through the efforts of one or two school librarians, a new concept is being integrated in many school districts: the recreation of the school library into a learning commons. In this setting, the school library becomes the true center of the school with new and expanded virtual services. When this is implemented fully, a central location in the school is designed to provide the space for teachers who teach other than in a formal classroom. Art, music, guidance counselors, and even school nurses are housed in this central location encouraging collaboration among all the teachers in planning experiences for students and providing the space to carry out this planning.

Another area being created within the school library is a place where students can gather to think, build, create, and produce their ideas and solutions to problems, a makerspace. Designed to promote creativity in students, it has all sorts of tools and equipment and such new technologies as the 3-D printer. If the library is heavily used for other purposes, the components of makerspaces can be placed on a book truck and moved from the library to classroom. The truly creative school librarian can offer much with little output and can engage the community to get them to volunteer to mentor students with their projects.

TECHNOLOGY AND THE SCHOOL LIBRARY

While some technologies were found in libraries before the mid-twentieth century, it was the influx of funding with NDEA and ESEA that provided for audiovisual resources and the accompanying hardware. Libraries were expanded to provide space for listening and viewing, as well as for housing and use of these multimedia resources. They were added to the library card catalog and systems were designed for check out and return. Perhaps two greater challenges came with the need for sufficient electrical outlets and a way to darken the library when the materials were being used.

This new media required a new approach to working with students and teachers, as well as many new skills beyond storage and retrieval. Demonstrating both the effective integration of audiovisual materials into the curriculum and the actual use of the equipment followed the new approaches to acquisition and organization of these, and a new role for the librarian who was suddenly thrust into the role of a teacher-trainer. This continues with available microcomputer technology and all the new formats of social media.

At the present time, librarians continue to demonstrate the appropriate use of the databases available and select appropriate websites and other information from the ever-increasing amount found on the Internet. They help teachers understand the best uses of social media for their

assignments and keep everyone apprised of new technologies.

The school library is the center for learning about the resources found on the Internet and how to use the available databases for teachers and students. Learning how to use new software whether for word processing or other applications happens in the school library. The librarian now trains both teachers and students in finding and using information, making the library the professional development center for the school.

ADVOCACY AND THE SCHOOL LIBRARIAN

The perception of many educators that the school library is no longer a needed part of a school and the consequence of loss of positions for school librarians is a constant threat to student access to information. The support of students, teachers, and members of the community who recognize the value of the information found in and through the library is essential. Readers of Levitov's book, *Activism and the School Librarian*, will "learn the theoretical foundation for activism, how to move from advocacy to activism, how to create a culture of advocacy in terms of working with parents, community groups, and local businesses."^[14]

This advocacy must move beyond the local community and reach legislators at the state and national levels. Kaaland and Kachel suggest that "school library *legislation* advocacy begins with the development of a relationship between school library advocates—librarians and beyond—and legislative decision makers."^[15] School librarians need to convince their students, teachers, and parents to help lobby for school libraries if these programs are to survive.

RELATIONSHIP WITH PUBLIC LIBRARIES

From the beginning, the relationship between schools and public libraries is one of constant change. In the early days of the United States, children did not attend school for long and libraries were only for the wealthy. As the country grew and as it became apparent that it would take informed citizenry to protect the new democracy, state governments began to fund public schools. As the townspeople built their public libraries, they looked at the school funding and wished that they had a similar mechanism for building an adequate budget. This resulted in some public libraries being a part of the school district funding, a model that exists at the present time in some cities.

Although early in education in the U.S. state legislatures were funding school districts, school libraries were not necessarily a part of this plan. Public librarians, looking at the dismal state of libraries at the elementary

level, began sending classroom collections to the schools so that children would have literature to read. The public library also provided the collection and often a librarian in the high school.

In the mid-twentieth century when this began to change particularly when elementary school libraries began to be developed and expanded, school librarians were hired. They could meet with their public library counterparts and true cooperation began. Some of the traditional ways that school and public librarians cooperate include the following:

- Public librarians come to schools to give book talks.
- School librarians collect any book left for students to read and return them after students have finished reading them.
- School librarians share homework assignments with the local public library using fax and e-mail to facilitate the process.
- School librarians invite the public librarian to come to school to explain the summer reading program and to encourage students to participate.
- Librarians invite each other to their staff meetings.
- Public librarians invite teachers to bring their students to the public library. School librarians promote these visits and even accompany teachers and students during the visit.
- Librarians can share the costs of author visits to their libraries, sure that they will attract students.

Cooperation is made easier when public and school librarians are active members of local librarians' groups. Again, newer technologies allow the establishment of e-mail lists to communicate. When cooperation is alive and well between school and public librarians, joint proposals can be written for funding.

With great regularity, as budgets for both schools and public libraries shrink, library and school administrators continue to seek ways to control funding for library services. Although the research shows that combining these two agencies does not result in budget savings,^[16-19] joint facilities continue to be viewed as a measure to cut costs. Little recent research has been conducted, but the factors in place for the earlier research have not changed enough to change those results. None were shown that actually saved money without cutting services.

Successful cooperative efforts that have been cost cutting have been the statewide efforts to provide digital collections, crossing all types of libraries and bringing information equity to everyone within a community. Joining networks that encourage the sharing of resources is a win-win situation. Opening electronic access to information opens access to children at school and to the community, not only when the public or school library is open, but also every day since homes with Internet access will have constant access to online resources. While public

libraries offer access to the Internet, getting to the public library may be difficult for children and for those who live in homes without Internet access, the school library may be their only access to the digital world.

MEASURING THE EFFECTIVENESS OF SCHOOL LIBRARIES

With the funding for the development of school libraries in the twentieth century, the need for professional school librarians increased. Academic programs needed full-time faculty to teach, and a greater number of persons joined doctoral programs to prepare for open positions. The increase in dissertation research added to the body of research. As these new faculty members worked for tenure, they had to continue their research output.

School librarians and faculty teaching school library courses in library and information science programs were eligible for competitive research from the Institute for Museums and Library Services and the Association for Library and Information Science Educators. Smaller grants were available through professional associations, and some vendors offered small grants. Moreover, professional journals featuring research results began providing a venue to share findings.

Research studies served to point out student success when schools had libraries, librarians, and resources. Gaver's landmark study showed the effect of centralized library services in elementary schools.^[20]

In 1989, David Loertscher, then Chair of the AASL Research Committee, and Phil Turner organized the first Treasure Mountain Research Retreat. The school library field was asked "What research questions should be answered by the time the next guidelines are written?" Seventeen research questions emerged, and research reviewers were asked to respond to the following:

- Analyze and synthesize the major research studies dealing with the topic.
- Describe the implications of these studies for practitioners.
- Identify research needs in the topic area for the next decade.
- Discuss the best approaches to use in designing and carrying out this research.
- Describe the infrastructure that must be present.^[21]

Fifty participants discussed the entries developed for this retreat. Subsequently, regular Treasure Mountain retreats have been held usually before the biannual AASL meetings. The results are published and available to help both practitioners and researchers understand what is needed in this field, how to go about collecting the data, and of even more importance, the reporting of this data to a wide audience.

At one Treasure Mountain session, school librarians met Stephen Krashen and discussed reading research, Krashen's *Power of Reading*^[22] (a second edition is available). In spite of the deluge of technology, reading was and is an integral part of the school librarians' assignment. Both Krashen and McQuillan^[23] continue to point out the role of the school library in providing opportunities for students to learn to read. Krashen suggests that few people in the United States are illiterate, it is just that they do not read or write very well. His solution is free voluntary reading, access to quantities of books and other materials that students will want to read, and time allocated so they can read. McQuillan suggests:

Many students attend schools where the level of print access is abysmal, creating a true crisis in reading performance. . . . I do *not* wish to argue that simply providing books is all that is needed for schools to succeed. . . . Teaching is much more than physical resources, and no progress can be made without qualified and sensitive teachers. But just as we would not ask a doctor to heal without medicine, so we should not ask teachers and schools to teach without the materials to do so. Reading material is basic to all education, and providing a rich supply of reading matter to children of all ages, as well as a place and time to read, is the first step to bridging the gap between poor and good readers. This means that school libraries must be stocked with interesting and appealing materials and appropriately staffed; students need to be given time to read silently books of their own choosing.^[23]

By the mid-1990s, the leader in the movement to show that well-stocked and well-staffed school libraries were keys to academic achievement, Keith Curry Lance, completed the first study of school libraries in Colorado.^[24] He patterned his federally funded study after one done by School Match, an independent company.^[25,26] This group had been hired to help real estate agents point out the best school systems for persons moving into the area. In his first study and three among many that followed, Pennsylvania, Alaska, and the second Colorado study, the same results prevailed. What the results of all these studies show is that to increase student achievement, a school community should do two things:

First, they create a quality information-rich and technology-rich environment easily accessible by students and teachers. That is, the school library now extends beyond its walls delivering quality information into the classrooms and into the homes of every learner 24 hours a day, 7 days a week. Learners flourish when quality information is close at home.

Second, they employ a staff of both professional and support personnel in the library center who provide leadership and tireless partnering with the teachers to deliver quality learning experiences. Achievement is affected by the two teaching partners using the best information technology and learning strategies.^[27-30]

School library research continues with individuals in more and more states conducting studies that use or modify the Lance methodology. All these studies report the effects of the library program on the education of children in schools today. The research confirms the importance of such a facility for preparing students to become lifelong learners.

THE VIRTUAL SCHOOL LIBRARY

Much has been written about the school without a library. The argument is that everything anyone needs is available electronically, which means that a school librarian in a book-filled library is no longer required. Certainly, the use of a reference book collection in a school has become obsolete because that type of reference is readily available online, and the speed to find answers is a plus. As evidence of this, watch what happens when someone poses a question about an actor as they are going into a movie. Cell phones appear and fingers click away until someone finds the answer.

As speedy and efficient as this seems, students and teachers need to know where to find accurate information. Students need to be able to use critical thinking skills to determine what information they need to find, to develop questions to guide their research, to evaluate what they find, and to report it in a variety of formats. Students also still need to be taught to read and to be discriminating readers, to sort out what is fact versus what someone would like to be perceived as a fact. As more and more becomes available electronically, it becomes even more important to have the information professional, the school librarian, select the best from these resources for students to use and to teach them how to use them. This is essential if they are going to learn to separate fact from misinformation. In some cases, it is essential that relevant resources be made available through selection by the librarian and links made so students do not drown in the wealth available to them. As the library moves from shelves and shelves of books to access through electronic devices, the school librarian is there to make sure all students have the devices and access to information no matter the economic status of their parents.

The school library remains the bastion to free access to information. Further, students must be encouraged to become lifelong learners if they are to accept their responsibility as citizens in a democracy.

AN INTERNATIONAL PERSPECTIVE

School libraries worldwide are better developed in the countries in the category of "developed" nations and

found less often in those countries considered “developing.” In the poorest nations, books of any kind are limited from textbooks to reference books and recreational reading. In some countries, the librarian is totally responsible for the collection and must pay for any books lost. This does not encourage free exchange of materials even if there are books available.

Cell phone technology is becoming available to students throughout the globe. It is only a matter of time until these students will be able to access information. With the speed with which translating software is being developed, this information will be available to them in their native language.

Two international organizations foster school library development. The International Association of School Librarianship (IASL) has almost 800 members in more than 60 countries. The group holds a meeting each year in a host country, publishes a quarterly online and print newsletter, and offers their excellent research journal, *School Libraries Worldwide* online. Furthermore, IASL maintains a website for its members and an electronic list for communication.

The School Library section of the International Federation of Library Associations and Institutions (IFLA) also focuses on the development of school libraries internationally. The IFLA also meets in a different country each year. The difference between this association and the IASL is that one joins the IASL directly, whereas one is a member of the IFLA through its member associations. That is, all IASL members may attend the IFLA as a member of the IFLA because the IASL is an association member. The IASL and IFLA’s School Library section have been able to work together on projects that will further development of school libraries worldwide, the latest being the development of international school library standards. More information about both these organizations may be found on their websites:

IASL: www.iasl-online.mlanet.org/

IFLA: www.ifla.org/

CONCLUSION

The future of school library services in schools has a challenge at the current time. The explosion of information that seemed overwhelming before the advent of the computers with their great storage capacities, coupled with the advent of the Internet and the introduction of the world’s knowledge in a teacher’s or student’s home, has increased the need for a location and an information expert who can help to sort through the myriad of resources available. It is up to school librarians to convince administrators, teachers, and the community to make sure students in today’s schools have open access to information.

Science and Engineering Librarianship

Margaret Ann Mellinger

OSU Libraries & Press, Oregon State University, Corvallis, Oregon, U.S.A.

Abstract

Science and engineering librarianship is an integral part of a broad range of theoretical and applied scientific fields; it provides access to current and cutting-edge research and preserves access to the historic scientific record. Science and engineering librarians work in organizations of all sizes ranging from solo operations and small libraries, to corporate research centers and research libraries of large universities. To interact successfully with their clientele, librarians must understand the scientific method, the structure of the scientific literature, and the communication patterns of scientists and engineers.

INTRODUCTION

Science and engineering librarianship has its roots in the specialized subject collections early scientific societies assembled for their members. Connections between scientific research and industrial progress fueled the need for science and engineering libraries and for establishing collections of scientific literature in university, public, and governmental libraries. The number of scientific societies and industrial organizations with libraries grew rapidly in the late 1800s and early 1900s, especially in Great Britain and the United States.^[1] Ranganathan attributes the rise of such specialized libraries, in part, to a change in focus from the macroscopic, or book level, to the microscopic, or article level.^[2] Scientists and engineers in research and industry recognized their need for collections of periodical literature and for librarians to organize those collections. Science and engineering librarianship provided documentation of the growing universe of scientific periodical literature through selection, acquisition, cataloging, indexing and abstracting, and tracking translations of the international science literature. Some of the major indexes of engineering and scientific information began in the late nineteenth century (e.g., *Index Medicus* and *Engineering Index*) or early twentieth century (e.g., *Chemical Abstracts* and *Biological Abstracts*).

Much of the literature on science and engineering librarianship from the 1920s to the 1970s focuses on the physical layout and management of the ideal library, training of staff, delivery of services, and the collection and organization of scientific literature. Scientific research and funding boomed in the period after World War II until the late 1970s, particularly in the United States, and there was a corresponding growth in libraries. The role of the librarian was to optimize the selection, acquisition, organization, and delivery of scientific information for the use of scientists, engineers, faculty, researchers, students, legislators, and the public.

Improvements in information technology led to new formats for library collections and new roles for librarians. Science and engineering libraries subscribed to online systems, purchased CD-ROM counterparts to print indexes, and offered mediated search services for early online systems and full-text databases. As the World Wide Web became predominant in the late 1990s, librarians no longer needed to mediate online database searches; library users could do those searches themselves. Librarians took on new roles to address issues related to electronic resources, such as licensing, managing subscriptions, devising new funding models, cataloging, user instruction, outreach, and promotion. In addition, librarians and researchers continued to conduct research on the information-seeking behaviors of scientists and engineers to learn how libraries could best facilitate information retrieval.^[3,4] Librarians began to offer value-added services such as literature searching, market research, patent searching, and materials properties searching.

Roles for science and engineering librarians shift and change as the information technology environment grows and changes. As access to scientific information and data becomes more ubiquitous, librarians can focus more on fundamental of the profession such as ensuring equitable access to information, providing safe spaces for learning and inquiry, and connecting learners to the skills and information they need to create knowledge. Rather than merely serving as custodians of scientific literature, twenty-first-century science and engineering librarians participate in the scientific process, help educate future researchers, and advocate for fair and equitable access to the scientific record.

SCIENCE AND ENGINEERING LIBRARY SETTINGS

Science and engineering libraries range in size from solo operations and branches of public libraries to settings in

very large corporations and universities. Public libraries, college and university libraries, corporate research centers, hospitals and medical libraries, and other special and technical libraries employ science and engineering librarians. Science and engineering librarians may also work as self-employed information researchers, in information brokerages, in government agencies, in museums, zoos, and aquariums, or for scientific, technical, and medical (STM) publishers and database providers.

Academic

Many science and engineering librarians work in college or university libraries. Depending on the type of academic institution, their duties can include core library functions such as reference, instruction, collection development, outreach, and, for tenure-track positions, research and writing. Some universities have separate libraries for various science disciplines. For example, the University of Wisconsin has science libraries covering agriculture and veterinary medicine, astronomy, biology, chemistry, engineering, health sciences, geology and geophysics, plant sciences, and physics.^[5] Other academic libraries provide science and engineering materials from a single science library, still others from a unified central library.

Public

Larger public libraries often have significant science and engineering collections, although they may not be housed in a separate library, as they are in the Science, Industry and Business Library of the New York Public Library^[6] or in the Los Angeles Public Library's Science, Technology & Patents Department.^[7] Investors, inventors, students, and entrepreneurs can access specialized collections of books, databases, and patent literature, and receive expert research help from highly trained librarians. Another example of a large public library dedicated to science and technology is the Linda Hall Library, an independent public library of science, engineering, and technology in Kansas City, Missouri.^[8] Linda Hall Library has an extensive collection of materials and librarians offer a suite of fee-based research and document delivery services to companies, academic institutions, and individuals throughout the world.

Corporate

Access to scientific and technical information is essential to scientists and engineers developing and designing industrial products. Special libraries in industrial or corporate settings employ science and engineering librarians to facilitate the research needed to bring new products to market. Some information centers or technical libraries can be centralized and large, while others serve smaller segments of corporate organizations. Sometimes,

technical libraries are in the research and development arm of the company. In response to the availability of online resources and materials, many corporate libraries have reduced the physical footprint of the library and moved to a virtual model of desktop delivery of information critical to the daily work of their clientele. Some corporations have closed their research centers in favor of the virtual library. Examples of corporations where science and engineering librarians work are Ford Motor Company, Intel, and Nike.

Government

U.S. federal government agencies run special or technical libraries such as those in the Environmental Protection Agency,^[9] the United States Forest Service,^[10] and NASA.^[11] Science and engineering librarians may work in major federal government libraries such as the Science Technology and Business Division of the Library of Congress,^[12] the National Library of Medicine,^[13] National Institutes of Health Library,^[14] and the National Agricultural Library.^[15] Some science librarians work directly with legislators, for example, at the national level in the Resources Science and Industry Division of the Congressional Research Service,^[16] or within state libraries. They also work on digital libraries and information initiatives such as the National Center for Biotechnology Information,^[17] and the databases Medline and Agricola.

Other examples of governmental technical libraries are those in the National Laboratories including Los Alamos National Laboratory^[18] and the Oak Ridge National Laboratory where librarians "help researchers compete for and carry out research of national importance."^[19] Public users may not be able to visit these technical libraries because of the sensitive nature of the work in the national laboratories and the locations of the libraries within them. An exception is the Hanford Technical Library, run by the Pacific Northwest National Laboratories, which is open to the public and shares a building with a Washington State University branch campus library and a United States Department of Energy Reading Room.^[20] Whether or not the physical libraries of national labs are open to the public, an increasing number of technical reports and unclassified documents from those libraries are available online. An example of such an online collection is SciTech Connect, administered by the Office of Science and Technology Information where thousands of United States Department of Energy documents can be searched and downloaded for free.^[21]

National Science Libraries

Many of the national libraries worldwide have collections or separate libraries dedicated to science and technology. Examples include the British Library's Science Technology and Medicine Collections,^[22] the *Bibliothèque Nationale*

de France Département Sciences et Techniques,^[23] the Russian Academy of Sciences,^[24] the German National Library of Science and Technology,^[25] the Japan Advanced Institute of Science and Technology Library,^[26] and the United States Library of Congress Science Reference Services.^[27]

Medical

Hospitals, government agencies, pharmaceutical companies, and other medical-related corporations are the settings for many medical libraries. There are also health sciences or medical libraries within teaching institutions offering programs in medicine, nursing, veterinary medicine, pharmacy, or allied health. The National Library of Medicine supports the dissemination of biomedical information in the United States, through the National Network of Libraries of Medicine (NN/LM®). Eight Regional Medical Libraries of the NN/LM® work to “improve the supporting infrastructure for health sciences librarians.”^[28] Another resource for medical librarians is the Medical Library Association.

Solo

Sometimes, there is only one science or engineering librarian in a company or institution. Solo librarians are “most likely found in a small library without extensive holdings or resources. Solos are expected to do it all—ordering, cataloging, reference, bibliographic instruction, online searching, filing, budgeting—everything.”^[29] Solo librarians can be found in marine science centers, or observatories.^[30] Professional organizations such as the Solo Librarian Division of the Special Libraries Association connect solo librarians to share resources, expertise, and provide continuing education opportunities.^[31]

Other Settings

Museums, aquariums, and zoos may have science libraries to support staff as they conduct research, build exhibits, and manage those institutions. Outside researchers and the public also use these libraries.^[32]

Other employment options for science and engineering librarians are to work as information brokers, to subcontract with governmental or corporate science and technical libraries, or to work for publishers. Information brokers are information professionals who provide as-needed or contract-based services to clients. Some information brokers are librarians with scientific backgrounds specializing in information collection and analysis. They may have skills in patent searching, engineering, chemistry, or computer programming and software design, for example. Information brokers may be self-employed or work in an information brokerage. They may be subcontractors

working with government or corporate clients, other research firms, or for individuals.^[33]

STM publishers and database producers employ librarians with science and engineering backgrounds to construct controlled vocabularies, perform indexing and abstracting services, and to interact with science and technology libraries and other clients for sales and training.

JOB REQUIREMENTS

Education

A master's degree in library and information studies from an accredited program^[34] is required for most science and engineering librarian positions in public, academic, special, and federal government libraries.^[35] Some positions require qualified candidates to have an undergraduate science or engineering background or to hold a second master's in a scientific field. There are distinct advantages to having a degree in the sciences, including enhanced subject knowledge, understanding the culture of the field, and increased credibility with clientele.^[36] Librarians with science degrees may also be better equipped to work in such specialized subfields as health, bioinformatics, chemistry, data services, or geographic information systems (GIS). To fill these specialized roles, some libraries hire candidates with advanced degrees in relevant scientific fields rather than degree holders in library and information sciences.

Skills

Science and engineering librarians need the same core skills that all librarians require—grounding in the philosophy and techniques of library service, knowledge of library materials and resources, and facility with computers, the Internet and commercially available library software.^[37] A study of job descriptions for science and engineering positions showed that the most frequently required qualifications were not specific to science or technology.^[38] Communication skills, computer and technology literacy, reference experience, teaching experience, and a team orientation were the most commonly required qualifications.

There are some science-related preferred qualifications for prospective science and engineering librarians. Employers may prefer candidates with a science and technology background, which can be coursework in science, a bachelor's degree in science, a library science course in science librarianship, an internship or practicum, or experience in a science library. Additional preferred qualifications are familiarity with the organization and structure of science and technology literature and knowledge of the scientific method as a process of discovery and invention. Some positions require specialized software skills, such as

the ability to work with and teach GIS software. Other jobs require expertise in searching chemical or molecular structures. The Medical Library Association has defined competencies for lifelong learning and professional success that include understanding of the health-care environment, the ability to manage health information resources in a broad range of formats, and understanding of scientific research methods.^[39]

Libraries are changing, and candidates who thrive in changing environments have an edge. Many of the preferred qualifications found in position advertisements are attitudinal. Candidates should exhibit innovation, creativity, curiosity, vision, optimism, integrity, and the ability to work well with a team.^[40] Another aspect of change in libraries is the focus on computer technology—technological skills and aptitude, web design skills, understanding of database structure and design, and searching expertise are examples of preferred qualifications for science librarians.

RECRUITMENT AND CONTINUING EDUCATION

Recruitment continues to be an issue in science and engineering librarianship. Administrators use a number of approaches to recruit librarians, one of which is to relax the requirement for a second degree in a science discipline. Many science librarians with social science or humanities backgrounds have learned science or engineering librarianship on the job. A 2000 survey of science and engineering librarians found that over half of the respondents came into their positions without a science background.^[41] One approach is to recruit promising students from science and engineering majors into library and information science degree programs. Many science or engineering students are unaware of the career opportunities in librarianship. Another approach is for libraries to fill specialty roles by hiring candidates without the library degree who have advanced science degrees and experience in areas like GIS, bioinformatics, statistics, or data collection and analysis.

Continuing education is important as many people come into science and engineering librarianship without a science background (or are assigned to areas outside of their science background), and because new roles are emerging. In some settings (e.g., medical libraries), continuing education credits are required. Professional organizations, library and information science programs, and conferences are venues for updating skills and learning about new areas. Training may be face-to-face, online, or a hybrid and may take place over a few days or a few months. An example of a successful face-to-face continuing education event is the Science Boot Camp for Librarians, which was developed in 2009 by science librarians in New England to help librarians learn about topic areas in science.^[42] This annual regional event has been duplicated

in regions across the United States and Canada. Another example is the Data Carpentry Workshop, which provides data skills training especially useful to librarians who provide research data services (RDS).^[43] Additional examples of selected professional development, conference, and continuing education resources have been compiled by the Science and Technology Section of the Association of College and Research Libraries Division of the American Library Association.^[44]

PROFESSIONAL RESPONSIBILITIES

Science and engineering librarianship includes reference, instruction, cataloging, collection development, and outreach or liaison. Beyond these traditional professional responsibilities, as previously noted, new roles are emerging in response to an ever-changing information environment. The importance of ensuring access to scientific literature spurred librarians to develop expertise in scholarly communication issues, including open access advocacy. Health sciences librarians may provide support for systematic reviews or serve as an embedded librarian in a research term, or as an informationist in a clinical or public health setting.^[45] RDS are increasingly offered to help students, faculty, and staff meet funding agency mandates and, more importantly, to encourage researchers in planning for the whole research lifecycle.

Reference and Consultation

Writing in 1994, C.D. Hurt asserted that “good reference service is predicated on three elements: 1) knowledge of the user, 2) knowledge of the literature, and 3) knowledge of the sources.”^[46] Librarians still need these three elements, but there are now many more channels for interaction with library users. Library clientele may now contact reference librarians 24 hours a day. To cover more hours of virtual reference service, librarians collaborate within their institutions and through networks of colleagues across time zones. Librarians interact with clients by using software tools for virtual reference, instant messaging, video-conferencing or video chat, and even in online game environments. Transactions can take place in real time or asynchronously. Librarians in special libraries provide value-added services along with reference consultations. They may synthesize the research on a particular problem or question, mine the literature for solutions to a problem, and write summaries for clients.

Many science and engineering librarians are skilled in searching highly specialized online databases, as well as standard print reference sources. Chemistry librarians track down chemical information using tools like *SciFinder Scholar* (*Chemical Abstracts*), *Beilstein*, and patent literature search engines. Genetics and molecular structure databases such as *GenBank*^[47] and *BLAST*^[48] are

important tools for biology and bioinformatics librarians.^[17] Geosciences and map librarians can develop reference and instruction services around GIS software. Engineering librarians can be part of courses where students are learning engineering design principles and need to gather information for their projects throughout the term.^[49]

Health sciences librarians integrate reference services into their clients' workflow in a number of ways. One way is to deliver content to mobile devices. Students in evidence-based medicine classes work with librarians to identify best evidence for treatment plans. In the Vanderbilt University Medical Center, the Research Informatics Consult Service (RICS) offers "... training, grant assistance, access to electronic resources, database searching and information filtering."^[50] Librarians make rounds, or house calls to deliver reference services directly to researchers and practitioners in the hospital.^[51]

Instruction

Science and engineering librarians teach people to create productive search strategies, as well as how to use subject-related periodical databases. Librarians train clientele to use powerful search tools for retrieving scientific information, such as those used in bioinformatics.^[52] Science and engineering librarians instruct users one-on-one, in workshops or classes, in stand-alone college courses, as well as through online tutorials. Academic librarians teach students information literacy skills and promote information literacy and science literacy concepts with faculty. They advise instructors constructing research assignments. Ideally, they are building relationships in which they can convey the tenets of information literacy to those who teach in the disciplines, as well as to students. Scientists and engineers need information literacy skills to succeed in their coursework, but also to develop lifelong information skills to help them succeed in their careers. Librarians have developed information literacy standards for science and engineering^[53] based on the Association of College and Research Libraries (ACRL) Information Literacy Competency Standards for Higher Education.^[54]

Science and engineering librarians use technology to deliver instruction to distance learning courses or distributed teams. Librarians increasingly depend on web page design, interface and tool design, online tutorials, blogs and wikis to deliver library content and services to users.

Collections

To work effectively with the scientists and public they serve, science and engineering librarians must understand the structure of scientific communication and develop a strong background in the specialized literature of their particular fields. This includes digital content. Librarians

manage access to digital resources such as online bibliographic, full-text, or fact-based databases. Online access issues, pricing, and license negotiations can be part of the collection development role for science and engineering librarians, especially those in smaller institutions. One of the challenges for libraries is that with online reference sources come yearly subscription or maintenance fees. Another aspect of the collection development role is collection analysis and evaluation in a hybrid print and electronic environment.

Science and engineering librarians select the same formats of materials most librarians select, for example, books, periodicals, reference materials, and multimedia. For many disciplines, the journal is the most important vehicle for scientific communication and it represents the historical scientific record.^[55] Online access to the periodical literature is critical to scientists and engineers, and librarians dedicate a lot of energy to the process of providing it. Many libraries have canceled print journals in favor of electronic journals and purchase online back files as a way to preserve access. Other types of periodicals that can be useful for science and engineering are product and trade catalogs and trade journals.

To further support and enhance access to the scientific record, librarians build institutional repositories and develop and manage digital libraries comprising born-digital and digitized information. There are nearly 2000 institutional repositories tracked by the Webometrics organization.^[56] Science librarians identify unique information sources for digitization and submission to institutional repositories. One example of this is the Technical Report Archive and Image Library, a collaborative project of the Greater Western Library Alliance and the Center for Research Libraries.^[57] On a broader scale, the National Science Digital Library "provides high quality online educational resources for teaching and learning, with current emphasis on the sciences, technology, engineering, and mathematics (STEM) disciplines—both formal and informal, institutional and individual, in local, state, national, and international educational settings."^[58]

Librarians require a working knowledge of formats that are particularly important in science and engineering librarianship: patents, standards and specifications, technical reports, conference papers, preprints and e-prints, maps, and data. Any of these formats can be "gray literature." Gray literature is "produced on all levels of government, academics, business and industry in print and electronic format, not controlled by commercial publishers."^[59] It is especially important in applied fields such as forestry and engineering.

The following is a superficial overview of some of the types of information sources particular to science or engineering. To gain understanding of the structure of science and engineering literatures, new or prospective librarians should consult the many secondary guides that are available.^[60]

Patents

The patent literature is a rich source of scientific and engineering information. While there are free online sources for patent searching (United States Patent Office Database, Google Patents, eSpace.net), librarians should be aware of more powerful subscription patent search engines and to understand when to refer library clientele to expert patent searchers.

Standards and specifications

Standards and specifications guide the design, production, and testing of goods and services. Each industry has many standards-developing organizations. Some of the major standards organizations are the National Institute of Standards and Technology, the International Standards Organization, and the American National Standards Institute. Librarians continually track the best ways for accessing standards and specifications. While some libraries still have print collections of standards, many libraries have moved to online subscription packages that provide access to standards when needed. Library users sometimes need historic standards for academic or legal research.

Technical reports

Technical reports are important in rapidly changing fields such as computer science and engineering where it is important to keep up with the latest techniques and innovations. Technical reports can result from grants, or contracts, and as such, are not subject to the same type of prepublication peer review as journal articles. Scientists and engineers can quickly disseminate their methodology, data, and results for others to review.^[61] Science and engineering librarians support the digitization of technical reports that increases discoverability and access.

Conference proceedings

Because conference proceedings introduce new ideas in a timely manner, the conference paper is the most important type of literature for much of computer science and engineering. Researchers in rapidly changing fields such as computer science and electrical engineering keep up with changes by tracking conference papers. Proceedings from very small or international conferences are sometimes difficult for librarians to collect. Some sponsoring organizations publish proceedings erratically.

Preprints and e-Prints

Preprint means prepublication print. Preprints gained widespread use in the field of high-energy physics after World War II.^[62] Physicists were also early adopters of

online dissemination of preprints, known as electronic preprints or e-prints. The High Energy Physics e-print archive, known as arXiv, was developed by Paul Ginsparg at Los Alamos National Laboratories and went online in August 1991.^[63] The arXiv, now at Cornell, contains over half a million documents covering physics, mathematics, nonlinear science, computer science, and quantitative biology. E-prints continue to thrive in physics and other scientific fields such as computer science and astronomy.

Handbooks and data sources

Handbook information is critical for science and engineering research and practice. Handbooks can contain information on anything from materials properties to spectral data, to biological and genetic data. Handbooks, data sources, and other types of reference sources are increasingly available in digital format. Online access to handbooks and data sources is advantageous to users in laboratories and off-campus.

Maps

Maps are core resources in astronomy, geomorphology, physical geology, and other geosciences, and are widely used in other disciplines such as the agricultural and biological sciences.^[64] Identifying, acquiring, cataloging, storing, and preserving maps is a complex group of tasks. Digital maps and their preservation add another level of complexity to map librarianship.

Data sets

Data Sets are used in geosciences, environmental sciences, health sciences, astronomy, and many other disciplines. Librarians assist investigators to discover and locate appropriate data sets for research and to identify data sets that can be curated for future use. The Registry of Research Data Repositories is a useful starting place.^[65] RDS in libraries range from simple reference (finding and citing data sets) to consulting with students, faculty, or staff on data management plans or metadata standards, to providing technical support and preparing data for repositories.^[66]

Translations

Scientific research is increasingly global. In addition, while English is currently the primary language for scientific publishing, this has not always been the case. Science librarians should be aware of translation services and of sources for translated scientific and technical literature.

Management, Marketing, and Promotion

Science and technical library managers establish strategic goals to align with the institution. They recruit, interview,

hire, manage, and evaluate and support the career development of library staff. Managers may also determine appropriate funding sources and financial management practices, and assess and communicate the value of the library to the broader organization.

Marketing and promotion are especially important in corporate libraries, where librarians must regularly demonstrate the value of the information center to the parent organization. Special libraries have developed means to measure the value of librarians and library services and to communicate the value to clients. Studying the needs of their potential internal customers, librarians focus services on the most critical needs of the organization or clients. The Special Libraries Association conducts research and collects information on the value of the information center.^[67] Marketing, promotion, and measuring the value of library services are increasingly important in academic and public libraries, as well. There have been a number of studies of return on investment for academic libraries.^[68]

Research and Writing

Writing is a vital part of science and engineering librarianship, whether it is composing content for web pages and pathfinders, analyzing and summarizing background information for an engineering client, crafting a press release, or compiling a grant proposal. Tenure-track academic librarians conduct research about all aspects of libraries and services, and communicate those results to the profession. All librarians need excellent research and communication skills and to keep up with new research and best practices in librarianship by reading journals such as *Issues in Science and Technology Libraries* and *Science and Technology Libraries*, by reading magazines such as *Information Outlook*, by following discussion lists and blogs, and by attending conferences and giving presentations.

Web Technologies

Web technologies continue to shape science and engineering librarianship. Science and engineering librarians use the capabilities of the participatory Web to deliver library content and services via blogs, wikis, RSS feeds, podcasts, streaming video, and instant messaging. They teach users to organize, manage, track, and share research using online tools such as EndNote, Zotero, or Mendeley. Librarians have an online presence on social networking websites and online communities. As stated in the revised *Competencies for Information Professionals of the 21st Century*, the successful science and engineering librarian “maintains current awareness of emerging technologies that may not be currently relevant but may become relevant tools of future information resources, services or applications.”^[69]

Scholarly Communication

Science and engineering librarianship has had a close relationship with the universe of scientific periodical literature from the beginning. *The World List of Scientific Periodicals published in the years 1900–1921*^[70] contained in two volumes the titles of 24,028 periodicals. Some estimates suggest that the number of scientific periodical titles doubles every 9 years.^[71] The journal literature is pivotal for scientists and engineers, and librarians have been actively tackling the complex issues surrounding scholarly communication for some time. These issues include publishing and subscription costs, copyright, and maintaining equitable access to scientific information in the digital environment. Journal subscription rates have escalated for many years, greatly outpacing the rate of inflation. Science and technology journals generally have the highest subscription rates as well as the highest annual price increases, which raises serious concerns about the sustainability of the current system of scientific communication.^[72] The scientific process builds on prior and related research, much of which is reported in peer-reviewed articles; decreased access to journals puts scientific researchers at a disadvantage.

Science and engineering librarians disseminate information about the crisis, and advocate for publishers and vendors to adopt more sustainable business models. Productive and close relationships with publishers and vendors give librarians a venue to communicate library issues. One example is the *Punch List of Best Practices for Electronic Resources*.^[73] This list, compiled by the Scholarly Communication Committee of the Engineering Libraries Division of the American Society for Engineering Educators, offers librarians and vendors a starting point for conversations. Librarians are active in SPARC®, the Scholarly Publishing and Academic Resources Coalition (SPARC), “an international alliance of academic and research libraries working to correct imbalances in the scholarly publishing system.”^[74]

Science and engineering librarians support a number of practices that improve access to scientific articles, including alternative publishing and pricing models, open access journals, and the development of institutional repositories. One early example of an alternative publishing model is how the SPARC collaborated with small societies and noncommercial publishers to build *BioOne*, a cost-effective online journal collection supporting biological, ecological, and environmental sciences.^[75] Another example of science librarians taking the lead is SHERPA, a UK consortium of research universities and industry partners that runs a number of projects supporting the development of open access repositories and researching scholarly communication issues.^[76]

Open Access

Science and engineering librarians have long championed open access as a means to address the serials crisis and to

ensure access to the scientific literature. One way to do this is to support open access publishing. The *Directory of Open Access Journals* includes journals in scientific and scholarly subject areas published in any language.^[77] *BioMedCentral* is an open access publisher with over 270 peer-reviewed journals.^[78] *PubMed Central (PMC)* is the U.S. National Institutes of Health (NIH) free digital archive of biomedical and life sciences journal literature.^[79] The Public Library of Science (PLOS) is a nonprofit publisher of a number of free, high-impact, open access journals supported by pay-to-publish fees, including the largest journal in current publication, *PLOS ONE*.^[80]

Global access to scientific information is an issue of great importance in science and engineering librarianship. Researchers, doctors, and scientists in developing countries are at a disadvantage because they lack access to scientific literature. Partnerships between major publishers of scientific information and three United Nations organizations are making medical, agricultural, and environmental sciences journals available for free or very low cost to local not-for-profit institutions in the developing world.^[81] The World Health Organization and six major publishers^[82] introduced the Health InterNetwork Access to Research Initiative in 2002. In 2003, the Food and Agriculture Organization and publisher partners initiated Access to Global Online Research in Agriculture.^[83] Online Access to Research in the Environment was launched in 2006 by a partnership of the United Nations Environment Programme, Yale University, and major publishers of environmental science information.^[84] These three programs will likely continue until 2015 as part of the United Nations' Millennial Plan.

E-Science

An enormous amount of scientific data is generated from satellites, telescopes, lasers, sensors, experiments, and simulations, giving scientists unprecedented access to large sets of networked scientific data. Computational power in conjunction with large data sets is driving a new research methodology called e-Science.^[85] E-Science, or cyber infrastructure, as it has been known in the United States, is a set of technologies that enable people to collaborate: to share computing, data, and the use of remote instruments. In other words, e-Science encompasses the technologies that allow networked, distributed, collaborative, multidisciplinary science. As libraries continue to define roles in collecting, preserving, and disseminating research derived from these large data sets, new areas of focus have emerged for science librarians, including data curation and digital preservation.

Data Management Plans and Research Data Services

A related role for librarians is to offer RDS to researchers and students. One of those services is to consult with and

guide scientific investigators proposing grants to the NIH and the National Science Foundation (NSF). In 2009, the NIH Public Access Policy required investigators funded by the NIH to submit an electronic version of their final peer-reviewed manuscripts within 12 months after publication.^[86] Beginning in January 2011, proposals submitted to the NSF were required to include a Data Management Plan (DMP), a document of two pages describing how research data will be stored and shared.^[87] Public access policies for government-funded scientific research are continuing to be instituted in agencies across Europe, the United Kingdom, Canada, and the United States.^[74] Librarians are in a good position to track these requirements and to offer assistance with open access publishing and data management plans to facilitate compliance. Communities and organizations have formed around supporting various aspects of data management. DataOne has developed the Data Management Planning Tool to give investigators templates for writing their own plans.^[88] DataCite is an organization that supports the standards for identifying and citing data.^[89]

Citizen Science

Citizen science is a term used to describe “public participation and collaboration in scientific research to increase scientific knowledge.”^[90] While scientists have partnered with amateurs to conduct research for years, the Internet, digital media, and mobile devices equipped with geographic positioning units have increased the opportunities for public involvement in the scientific process. Librarians can support citizen science in many ways; by connecting library users with science researchers and by providing services for citizen science, such as data curation and technology training, and by capturing and preserving the formal and informal outputs of citizen science.^[91]

Makerspaces

Makerspaces are places where people meet to share resources like knowledge, skills, tools, and technologies in order to work on their own projects and creations. The focus is on community and sharing—values libraries share. For this reason, many public and academic libraries have developed spaces and programs that support “do-it-yourself” or “do-it-with others activities.” Public libraries large and small employ technology loving librarians and volunteers to run spaces like the TechCentral in the Cleveland Public Library and TekVenture in Indiana's Allen County Public Library.^[92] Librarians at the DeLaMare Engineering Science and Engineering Library at the University of Nevada, Reno offer a makerspace with 3D printers, 3D scanners, and laser cutters.^[93] They also circulate equipment such as electronics and robotics kits that students can use in their own projects.

PROFESSIONAL ORGANIZATIONS

Engineering Librarianship. Science and engineering librarians can be active in a variety of national and international professional organizations, depending upon subject specialty, library setting, and personal interests. The following are some key organizations of particular interest.

American Library Association (ALA) Science and Technology Section (STS)

http://www.ala.org/ala/acrl/aboutacrl/acrlsections/science_tech/sts.cfm

The Science and Technology Section (STS) is in the ACRL Division of the American Library Association. Established in 1961, as the Agricultural and Biological Sciences Subsection of ACRL, the organization later changed its name to reflect the subject specialties of its members. STS offers its over 1700 members conference programming and continuing education opportunities. Publications of the section include the STS-L discussion list, the STS-Signal newsletter, and a peer-reviewed online journal, *Issues in Science and Technology Librarianship*.

American Society for Engineering Education, Engineering Libraries Division (ASEE/ELD)

<http://eld.lib.ucdavis.edu/>

Engineering Library Division members are librarians and information professionals interested in promoting the role of the library as an integral part of engineering education. ELDNET-L is the open electronic discussion list for the division.

Special Libraries Association (SLA)

<http://www.sla.org/>

The Special Libraries Association began in 1909 “to promote the collection, organization and dissemination of information in specialized fields and to improve the usefulness of special libraries and information services.”^[94] Several Special Libraries Association Divisions are related to science and engineering. They are the Science and Technology Division, the Physics, Astronomy and Mathematics Division, the Chemistry Division, the Engineering Division, the Biomedical and Life Sciences Division, the Environment and Resource Management Division, and the Food, Agriculture and Nutrition Division.

Medical Library Association (MLA)

<http://www.mlanet.org/>

The Medical Library Association was founded in 1898 and has members worldwide.^[95] The MLA focuses on the unique issues faced by health sciences information professionals as they deliver critical medical information to physicians, health practitioners, and patients. Several types of publications meet MLA members’ needs: the peer-reviewed *Journal of the Medical Library Association*; newsletters MLA-Focus and MLA News; books; standards; reports; and other documents. MLA offers continuing education courses and delivers medical information training around the world through the Librarians without BordersSM program.

International Federation of Library Associations and Institutions (IFLA)

<http://www.ifla.org/index.htm>

IFLA’s Science and Technology Libraries Section (Special Libraries Division) was formed in 1978. The section supports science and engineering librarianship worldwide, through programming at the IFLA Annual Conference, by conducting research projects on topics of global interest, and by collaborating with other library associations to address issues pertaining to the access and dissemination of scientific literature. Members share information through the section newsletter and the STL-SC discussion list.

International Association of Aquatic and Marine Science Libraries and Information Centers (IAMSLIC)

<http://www.iamslc.org/>

IAMSLIC directs the Aquatic Commons, an open access repository for literature on natural marine, estuarine/brackish, and freshwater environments. Its purpose “is to promote such cooperation and sharing of resources among libraries and information centers which specialize in any aspect of aquatic science—freshwater, brackish and marine.”^[96]

There are also smaller organizations that focus particular fields of librarianship. In addition, many science and engineering librarians join organizations related to their subject domain. These are a few examples:

Association of Independent Information Professionals (AIIP): <http://www.aiip.org/index.html>

American Association of Physics Teacher (AAPT): <http://www.aapt.org/>

The American Chemical Society (ACS) Division of Chemical Information: <http://www.acscinf.org/>

American Society for Information Science and Technology (ASIST) Scientific and Technical Information Science (STI) Interest Group: <http://www.asis.org/SIG/SIGSTI/sti.html>

Geoscience Information Society: <http://www.geoinfo.org/>
 International Association of Agricultural Librarians and Documentalists (IAALD): <http://www.iaald.org/>
 International Association of Technological University Libraries (IATUL): <http://www.iatul.org/>
 United States Agricultural Information Network (USAIN): <http://usain.org/>

CONCLUSION

For over a century, science and engineering librarianship has been instrumental in the advance of modern theoretical and applied science and technology. To remain relevant, future science and engineering librarians will need a keen understanding of the interplay between the information needs of scientists and engineers, and the technologies, economics, and politics that influence access to critical data and information. Librarians alone will not be able to solve the information challenges that a new era of science will bring; a greater degree of collaboration with other professionals will be essential. As Web technologies mature, librarians will require the knowledge and skills to employ them to improve information retrieval and to facilitate research that will be increasingly global, collaborative, and interdisciplinary. Science and engineering librarianship has clearly evolved in the twentieth century in response to changes in information technology and shifts in scientific research, and the pace of change is unlikely to slow. The future of science and engineering librarianship is not in responding to change, but in facing change by participating fully in it.

Science and Technology Studies

Sanna Talja

Department of Information Studies and Interactive Media, University of Tampere, Tampere, Finland

Abstract

This entry introduces theories of technology developed within the interdisciplinary field of science and technology studies (STS). Theories of technology within STS are conventionally divided into the social shaping of technology (SST) perspective, the social construction of technology (SCOT) perspective, actor-network theory (ANT), and gender and technology studies. The practice theory is emerging as a distinct line of thought and analysis.

INTRODUCTION: THEORIES OF TECHNOLOGY AND INFORMATION SCIENCE

This entry introduces theories of technology developed within the interdisciplinary field of science and technology studies (STS). Theories of technology within STS are conventionally divided into the social shaping of technology (SST) perspective, the social construction of technology (SCOT) perspective, actor-network theory (ANT), and gender and technology studies. The practice theory is emerging as a distinct line of thought and analysis.

Theories of technology developed within STS are important from the viewpoint of information science. Theories and assumptions of what technologies are, how they emerge, and how humans and technologies interact, are important for many research areas in information science. In fact, regardless of whether researchers explicitly define and expose their viewpoint on technology, such views are always present and influence research aims and questions in information science, a field that is concerned with the interaction between information/documents, technologies, and users.

Within information science, STS theories are applied in research fields such as knowledge organization, scholarly communication, citation studies, scientometrics, social informatics, digital libraries, and knowledge management. Some scholars have argued, however, that STS and information science should not be seen as separate fields of study. According to this view, theories developed within STS are the core theories that empirical research programs in information science should draw on. In fact, three different views exist on the relationship between the interdisciplinary fields of STS and information science. Some scholars see these fields as overlapping, that is, as having shared theoretical foundations and research interests. Some scholars see that there is partial overlap between STS and information science in theoretical constructs and research interests. According to a third view, STS and

information science are separate research fields—there is only little or no overlap in research topics and interests. Research areas in information science where STS theories have traditionally been less cited and applied are, for example, everyday life information seeking research and information literacy research.

Regardless of whether STS and information science are seen as unified in their interests and theories, to some extent overlapping, or as separate domains, information science and STS are cognate research fields. Their research interests increasingly cross since information, media, and technology are in current digital environments more and more intertwined. Examples of such integrated information, media, and technology environments are, for example, social media applications such as wikis, blogs, social networking, and social bookmarking services.

This entry proceeds by first briefly introducing STS. After presenting some antecedents to theories of technology in STS, this entry introduces the theoretical perspectives of SST, ANT, SCOT, gender and technology studies, and practice theory of technology. This entry ends by briefly discussing the relationships between STS theories, and the relationship between information science theories and theories of technology.

THE ROOTS OF SCIENCE AND TECHNOLOGY STUDIES

Science and technology studies has roots in the sociology of scientific knowledge and in the social constructivist movement in the study of scientific knowledge production, the “empirical programme of relativism.”^[1] This movement consisted of historical and sociological analyses of the processes which lead to the acceptance of new scientific knowledge. Empirical “laboratory studies” of the mundane everyday practices of scientific work conducted in the late 1970s and 1980s sought to show

how scientific facts are socially constituted and negotiated.^[2-4] A central insight was the indecisiveness of experimental data taken by themselves. Results from scientific experiments are rarely self-evidencing, and initially allow for a degree of interpretative flexibility, that is, alternative interpretations of the empirical evidence. Such ambivalences and potential controversies must for practical reasons at some stage be closed down, since the results must be presented in a clear and non-ambivalent manner in the form of reports and journal articles. The detailed empirical analyses of the contingencies involved in the construction of scientific facts showed how like any work practice, scientific knowledge production involves not only purely cognitive factors but a complex configuration of technological tools, work organization, professional norms and skills as well as formal and informal communication practices. The empirical programme of relativism was influential for the development of the STS research field.^[5] It brought about the understanding that it is fruitful to view technology and technological practices as built through processes of social construction and negotiation in the same way as scientific knowledge.

Science and technology studies were also preceded by sociotechnical studies of computerization in organizations conducted in the 1970s (for a review, see Kling^[6]). These studies stressed that technologies are tightly interwoven with the overall organization of work, the nature of work tasks, social relations at the workplace, and the very conditions and experience of work. This insight led to a more general understanding that a work task mediated by a new technology does not remain the same. New technologies require new intellectual and bodily moves and skills. As a consequence, new needs, meanings, practices, and purposes arise in the work. The concepts of “reskilling” and “deskilling” were used in early studies of computerization and social and organizational change to describe these changes. Later, these concepts were replaced by a more general understanding that any work task involves a combination of physical objects, knowledge and skills, social interactions, and routinized ways of doing things.

Theories of technology in the STS field also developed as contests to technological determinism. Technological determinism is an influential way of thinking about the relationship between individuals, technology, and society—or, more explicitly, the “information society.” It is based on the implicit assumption that technologies are developed through series of innovations undertaken in attempts to overcome the weaknesses and shortcomings of earlier technologies, and that new technologies straightforwardly represent progress and outdate earlier technologies. This perspective constructs technologies as tools with fixed meanings whose uses are known (i.e., immediately identifiable and clear), and defined by the original aims of their designers.

Technological determinism has also been called the technology independence assumption.^[7] According to this

assumption, technology and social relationships each are constituted and evolve independent of one another. Within STS, technologies are not understood solely as tools used for practical purposes. The assumption is that technologies are more pervasive in nature: social and power relations are encoded into technologies, and technologies also embody social relations and aspirations in concrete and powerful ways.

Another central idea in STS is that technologies are the products of “heterogeneous engineering”^[8] which refers to how they are emergent rather than stable phenomena. Whatever may have been the system designers’ original plan, what actually gets produced and reproduced does not fully follow a single fixed plan or strategy. What happens depends on the strategies of a whole range of actors. The “technical features” of technologies are not fully controlled and regulated by any single group of actors. Neither are the consequences, opportunities, and constraints of technologies stable across contexts.

SOCIAL SHAPING OF TECHNOLOGY

The SST perspective emphasizes the mutually shaping relationship between the technical and the social.^[9] The relationship between technology and society is described as “a seamless web”^[10] meaning that technological, social, and cultural worlds and practices are interrelated and inextricably linked.

Social shaping of technology posits that the formation of technologies cannot be explained through a single rationality or imperative: economic (market demands), political (social power relations), technological or material conditions for innovations, or the social interests and desires of particular groups. It seeks to open up the “black box” of technology production by a detailed analysis of how the social, organizational, cultural, and political environment in which a technology originally was created fundamentally shaped the technical characteristics of the artifact.^[11] In its interest of going back in history to study how technologies developed, SST is closely related to historical studies of technology.

Central concepts in SST are “interpretative flexibility,” “relevant social groups,” and “closure.” These concepts contest the notion that technology develops autonomously and according to an inner logic. The concept of interpretative flexibility refers to a core assumption in SST that every stage in the generation and implementation of new technologies involves a set of choices between different options. The initial openness means that choices could always have been different. Each technology could have been constructed based on a different set of premises and decisions. The choices eventually made are not dictated solely by technological considerations. A range of social and contextual factors affect which options are eventually selected.

“Closure” means that the openness to alternative solutions and interpretations present at earlier stages must at some point become regarded as closed, and potential disagreements related to design decisions and their consequences resolved. Such decisions are seen to be guided by alliances between “relevant social groups” and the coming together of their interests. For instance, when a technology moves from planning stages to selling and marketing stages, the representations concerning its content, functions, meanings, and uses become relatively stable.

Ruth Schwartz Cowan’s “How the refrigerator got its hum”^[12] is one influential study in the SST perspective. The study showed that technical qualities, in terms of energy-saving and silent machinery, did not explain the type of refrigerator technology that came to dominate the market—a better technology lost the competition. Analyzing the processes of innovation, patenting, production, and marketing, she came to the conclusion that many interrelated factors explained the outcome of the process and the type of technology that gained market dominance.

Studies conducted from the SST perspective seek to track down all possible proposed solutions by relevant players that were available in the design context in the formative time period, regardless of whether the solutions later turned out to be successes or costly mistakes.^[13] Such historical investigations shed light on why some artifacts succeed and others fail. Both historical and organizational case studies have led to a deeper understanding of typical causes for failure and conditions that must be filled for a technology to succeed.

The assumption in SST is that a technology is eventually stabilized through getting rooted in stable organizational arrangements. But whatever the system designers may have had in mind and wished to do is not the only factor explaining the outcome. What actually takes form depends on the actions, interests, and strategies of a range of other actors as well. There is a network of varying interests and strategies at play, and technological closure means that these reach some kind of accommodation. Closure in technology does not mean, however, that both designers and users would eventually agree on the content, purposes, and uses of the technology. The notion of interpretative flexibility also means that differences continue to exist between different social groups in how they come to see and experience a particular technical artifact. Not only is there a great deal of flexibility in how an artifact is designed, the process of redesign continues throughout its marketing, implementation, and use.

ACTOR-NETWORK THEORY

The ANT was developed by Michel Callon,^[14] Bruno Latour,^[15] and John Law^[8] as an attempt to more fully incorporate technical artifacts as actors in accounts of human action. Latour^[15] termed nonhumans as the

“missing masses” in sociological accounts. He argued that the orderliness of everyday life to a great extent relies on a distribution of tasks between human and nonhumans. Tasks performed by humans can be delegated to nonhumans, as when a policeman guiding traffic is replaced by traffic lights. The function of traffic lights is to guarantee orderly behavior. Even more generally, argues Latour,^[16] when nonhumans are delegated human tasks, nonhumans shape human action in that they “prescribe” certain kinds of action. Prescription is what a device anticipates, allows, or forbids a human actor to do. There is morality in such prescriptions, termed by Akrich^[17] as the “affordances” of a technology. Traffic lights aim at permitting some actions and inhibiting others. This does not mean that a real human actor would necessarily follow the action guidelines of the prescribed, inbuilt user. Latour’s^[15,16] main point is that nonhumans deserve full consideration as social actors. As prescriptions are encoded in machines or devices, they are delegated not only duties but also values and ethics that greatly add to the overall orderliness of societies.

In a similar vein, Law^[18] argued that “the social is not purely social at all,” since the social world would not hang together if the natural, the corporeal, the technological, and the textual were taken away. What we usually call technical is partly social, since in practice nothing is purely technical. And what appears to be the social is partly technical; scraping the social surface we will find that it is composed of networks of heterogeneous materials (p. 10).^[18]

The first version of ANT had much in common with the SST approach. It was developed to avoid explanations of single influences, interests, or background factors—social, economic, or technical—guiding the development of technical artifacts.^[19] ANT posits that the background “interests” formative in technology development are in themselves achievements which depend on a coming together of many conditions: creative, material, financial, legal, markets, and so on.

Within information science, ANT has been applied, for example, by Rob Kling and his colleagues. Kling, McKim, and King analyzed Electronic Scholarly Communication Forums (e-SCFs) such as e-journals, digital libraries, and collaboratories, as sociotechnical interaction networks (STINs).^[20] Kling and colleagues (p. 48)^[20] defined an e-SCF as a network that includes people/organizations, equipment, data, diverse resources (such as money, skills, status), documents and messages, legal arrangements, enforcement mechanisms, and resource flows. There are social, economic, and political factors that enable the interactions that sustain such a network. Attempts to analyze the success or failure of an e-SCF also must take into account the interactions between different technical systems, both large-scale global technological systems and local technologies-in-use.

ANT studies focus on exploring how actor-networks get formed, hold themselves together, or fall apart.^[21]

Kling and his colleagues^[20] conducted insightful analyses of why a technology that on the surface is essentially the same technology—a pure e-journal—can gain momentum in one context and fail in another. Kling and colleagues^[20] showed that if a single network element differs across contexts, the innovation simply no longer is the same. Their empirical studies on the successes and failures of pure e-journal and preprint archive initiatives in some disciplines explained under what kinds of circumstances some components of the STIN will offer resistance (termed by Latour as “antiprograms”).^[16]

ANT case studies have been criticized by Latour, Callon, and Law^[22] themselves as being merely descriptive. Others have criticized ANT studies for the preference for historical analyses of the formation of actor-networks rather than tackling contemporary technologically mediated social life-forms. Kling and colleagues^[20] argued, however, that STIN modeling could be conducted before implementation, which would help in predicting the success of e-SCF design initiatives.

Latour,^[15] in turn, preferred to describe ANT as purely sociological analysis, the “sociology of translation.” In his view, the purpose of ANT research is to “follow the actors” that constitute a sociotechnical actor-network. The study of the constitution of an actor-network is not to study a process of straightforward acceptance or rejection of an innovation, it means following the process of its transformation. “Translation” implies that one technology may stand for another thing in a different context. Actor-network theory analyses show how keeping an innovation functional and achieving its intended effects is a constant struggle with no guaranteed outcomes. Actor-network theory also assumes that social groups encountering a new technology can in fact be deeply transformed by the innovation. Actors and technologies hence coproduce each other, and the interest in ANT is in how these coevolve.

One of the best known studies based on ANT’s concept of translation is by Star and Griesemer^[23] who examined the early development of a natural history research museum (a museum not open to general public), the Museum of Vertebrate Zoology at the University of California, Berkeley. Star and Griesemer focused on how scientific work, conducted as the cooperation between diverse groups (humans, nonhumans, scientists, and non-scientists), inhabiting and participating in different social worlds, was achieved and managed. Objects such as species and subspecies of mammals and birds carried different meanings in these different worlds. Actors wishing to cooperate faced the task of developing tools for reconciling these meanings and for maintaining effective collecting and information-keeping practices. Star and Griesemer^[23] found that developing methods for standardization and the creation and management of “boundary objects” were the main means for disciplining the joint activities.

The analytical concept boundary object, having its roots in ANT, has become widely used both in STS and

many other research domains, including knowledge organization research. Star and Griesemer likened boundary objects to “road maps” whereby concrete objects such as field notes are turned into abstract objects for the purposes of standardizing work practices. Boundary objects thus guide and inform the translation work required for successful collaboration between diverse groups. Boundary objects reconcile differences in interests between groups, differences in degrees of abstraction in the description of objects, and differences in units of analyses. A standard indexing scheme is one example of a boundary object. It does not accurately describe the details of any one object or thing. It is, however, able to serve as a means of communication across diverse lifeworlds. It conveys standard information and reconciles multiple viewpoints. It satisfies the minimum informational demands of all concerned parties in describing and capturing properties of objects (e.g., data or documents) that fall within the minimally acceptable consensus range.^[24]

Geoffrey Bowker and Susan Leigh Star’s^[24] well-known work on classification systems also draws from ANT. Bowker and Star showed how in many types of work, classification systems and recordkeeping technologies form the infrastructure that allows the ongoing reproduction of relevant practices and historically constituted order of things. They showed how classification and recordkeeping technologies are a fundamental aspect of the practical management of everyday activity. The interest in document work and recordkeeping practices has continued to occupy a central position in practice-oriented studies of work and technology. Many practice-oriented studies focus on organizational practices of documentation and recordkeeping and analyze them in a detailed manner. The assumption is that organizational records are central for the ongoing accomplishment of mutually intelligible concerted action and function as ordering devices for organizational accountability.^[25,26]

From the viewpoint of information science, ANT has been particularly influential in two ways. First, it teases apart the common notion that it is meaningful to make a division between “people-centered research” and “system-centered research.” Actor-network theory takes the analytical stance that it is not tenable to start from the notion that people are special, and divide people and technologies into two separate heaps.^[21] From the ANT lens, a copy machine, for instance, is a network of interacting technical materials but also entails roles played by human actors such as operators and repair-persons. Human actors are also generated in networks of heterogeneous social relations and technical materials. This is because human actors assume specific roles and have special attributes in diverse STINs. The concept of affordance, central in ANT, posits that there exists no sharp division people and technology and thus mandates research designs bridging existing divides between people-centered studies and system-centered studies.

SOCIAL CONSTRUCTION OF TECHNOLOGY

The SCOT perspective is embedded in the linguistic turn in the human and social sciences. Social constructionism emphasizes the role of language in the construction of social reality. The basic assumption in social constructionism is that language is not merely a tool for expressing ideas, rather, language sets the boundaries for expressing emotions, knowledge, and views. Studies in the SCOT perspective focus on “representations” of technology and users. Keith Grint and Steve Woolgar (p. 32)^[27] defined the object of research in SCOT as “the regimes of truth which surround, uphold, impale, and represent technology.” The SCOT perspective defines technologies as texts that are written and read. Although technologies are, naturally, also concrete and material, for the purposes of analysis, it is fruitful to adopt a counterintuitive way of thinking about technologies as texts. This makes it possible to see that technologies do not exist independently of human interpretation. Capabilities are attributed to technologies by humans.

The emphasis on the textuality of technology is based on the insight that any attempt to study the “impacts” of new technologies inevitably represents a specific discourse. Descriptions of the large-scale effects of technological change or impacts of new technologies tend to get trapped in either positive (utopian) or negative (dystopian) discourses.^[28] Grint and Woolgar^[27] argued that impact studies are implicitly based on the assumption that there are some inherent static properties in technologies which account for their impacts on work and everyday lives. In SCOT, technologies are unstable and indeterminate artifacts whose significance is negotiated and interpreted but never settled. According to the SCOT theory, since we have no access to reality other than through our social constructions of it, we always have to hold a question mark over what the significant constraints or enablers of a technology are.

According to Foucauldian, thinking concerning the relationship between power and knowledge, not every representation of the nature of a new technology carries equal authority. Some interpretations appear as more credible and objective than others. According to Grint and Woolgar,^[27] in analyzing accounts and representations of technology, the important question to ask is “why do we believe some people’s accounts but not others?” and “What is the work that discourses of technology perform in different communities and contexts?”

Talja^[29] applied the SCOT approach to analyze the implications of discourses concerning information technology users and IT skills. She emphasized that neither standardized tests of skills nor self-assessments of computer skills represent the truth about IT competencies. The variables tested such as computer attitudes, computer self-efficacy, or computer anxiety, are in themselves parts of large-scale discursive formations. They are based on

specific lenses on what are the “core” properties of information and communication technologies and what constitutes competent IT use. In addition, people’s self-assessments of their own computing skills are context-dependent communicative constructs. They are dialogic, situational, perspective-dependent, variable, and multilayered entities. When IT and IT skills are described and approached from different angles, different aspects and truths concerning computing come into view. However, the discourses generally used in society to describe IT competencies shape users’ interpretations of their own IT expertise. General notions of IT expertise and of the groups that possess IT expertise may leave ordinary technology users with a conception of their competencies as limited or elementary.^[29] In dominant discourses, computing expertise is not described as something that is always situated, work task and domain-related.

In advocating the SCOT perspective, Grint and Woolgar^[27] contested both ANT and SST case studies. Such case studies in their view typically bring out only one version of “what happened in reality,” and posit their stories as objective facts. They also criticized the innovation-centeredness of SST, the focus of studies on early stages of technology development at the expense of analyzing prevailing technology discourses that have a profound influence on IT policies and initiatives and IT training.

GENDER AND TECHNOLOGY STUDIES

Gender and technology studies foreground the ways in which technology, expertise, and gender are intertwined and mutually shaped. Feminist scholars such as Cynthia Cockburn^[30] and Judy Wajcman^[31,32] emphasized that the way technologies are designed and implemented contain specific ideas of what is the logical and desired way of performing work tasks. In gender and technology studies the notion of “interpretive flexibility” loses some of its credibility. Whenever an artifact is designed, theories of about users and their behavior, assumptions concerning their activities and their social contexts, notions of what is simple, pleasurable or aesthetically satisfying, specific ideas about knowledge and rationality, come into play. Women and also men, having their own practices and experiences, may in fact experience technologies as highly inflexible.^[33]

As technologies and technological languages highlight certain expectations of use and qualities of users, they also implicitly tell people what sort of people they are. A central interest in gender and technology studies is how information technology intertwines with our thinking, acting, and identities. Donna Haraway’s^[34] famous cyborg concept conveys an idea that the boundaries between humans and machines, natural and artifactual are leaky; all people are hybrids of machines and living organisms. The cyborg

image presents technology as an aspect of our embodiment: it is inbuilt in us. Gender and technology studies mandate that technology needs to be subjected to discerning and critical examination both from the viewpoint of subjects' bodily and historical experiences and from the viewpoint of larger (macro)social and discursive orders.

The emphasis on the situated nature of knowledge is the major difference between SCOT and gender and technology studies. The SCOT perspective has often been criticized of extreme relativism. Some critics view especially the argument posed by Woolgar that every sociological explanation ends up positing a final truth when the final truth cannot by any means be captured, as "deconstruction gone mad." Gender and technology studies start from the assumption that knowledge is site-specific and relative to human agents in specific settings. Knowledge is also embodied, that is, deeply rooted in specific practices and experiences.^[34] This notion does not mean that "agency" would be limited to human actors, only that technologies cannot be understood or studied independently of everyday experiences and practices which constitute people as specific kinds of people. Gender and technology studies are interested in how the intertwining of the self and technology takes place in concrete everyday life settings.^[35]

Empirical studies within the gender and technology studies tradition do not claim to be nonpolitical, neutral, or objective. Gender and technology studies adopt an analytic stance called strong objectivity. This stance is based on the standpoint epistemology developed by Sandra Harding,^[36] Donna Haraway's^[34] concept of situated knowledge, and Karen Barad's^[37] theory of agential realism. All these theorists stress that knowledge is always positioned; it is produced from a particular standpoint and can only represent a partial perspective. Acknowledging this, the important question is from whose viewpoint is the social world examined and described. Haraway's^[34] concept of situated knowledge embraces a view that a degree of partial objectivity can be reached if the analyst explains her position as clearly as possible. Haraway^[34] argues for the replacement of various forms of unlocatable, and hence irresponsible, knowledge claims with a practice of objectivity that privileges especially marginalized and excluded voices, in the hope for transformations in technological systems, systems of knowledge, and ways of seeing. Gender and technology studies mandate accepting responsibility for the kinds of representations produced and attentiveness to the way that scientific accounts take action in the ongoing reproduction of phenomena.

Gender and technology studies contest the notion of technological systems and environments as gender-neutral. Historically, technology and especially information technology, has been developed mainly by men. Information technology has carried and invisibly still carries strong connotations and images of male expertise.^[32]

Studies of technologies in home environments have shown that girls' and boys' computing activities tend to

be perceived differently.^[38] Studies have for instance shown that girls' computing activities such as chatting and online shopping are more often constructed as forms of entertainment, casual leisure, or consumption. Boys' activities such as gaming and downloading free software are more often perceived as expertise-building and expertise-requiring activities. In a study of IT in Finnish homes and families, Nieminen-Sundell^[38] discovered that computers in families were often placed in boys' own rooms and surrounded by objects related to the boys' interests in computing. There is a strong connotation between computing and male expertise. The families in Nieminen-Sundell's study regarded boys' interest and engagement in computing as more than natural and something to be encouraged. In the Finnish families studied by Nieminen-Sundell,^[38] the mothers often had extensive work-related experience of computing. Yet, in family interviews, mothers' computing skills were often downplayed or even joked about. Even the mothers themselves often described themselves as incompetent and as needing their sons' help and advice in matters related to computers. Regardless of the real breadth and depth of the computing expertise of mothers or their sons, the cultural expectation is that young boys perform well with computers. Computing can also have deep symbolic and ritual meanings. Young girls may avoid getting too much involved in computing whereas as regards boys, mastery of computing may culturally be unconsciously perceived as part of the growth into manhood.^[38]

Ethnographic studies of the domestication of new technologies have reached interesting findings concerning the status of diverse technologies at homes. This is not reflected only in the physical placement of technological artifacts at the home and or the domestic patterns of their use.

Nieminen-Sundell^[39] asked married couples to name the technologies they have in their homes. Alarm systems, computers, and digital cameras were typically named and classified as representing technology. Hair dryers, vacuum cleaners, and cooking stoves, in turn, were not typically mentioned or counted as technology. What represented technology was related to the relative novelty of the technology and to whether they were used mainly by men or women.^[39] What represents "smart" technology or even technology thus changes with both the domestication of technologies and gendered patterns of their use.

PRACTICE THEORY OF TECHNOLOGY

Anthropological studies of technology conducted since the 1970s at the Xerox Palo Alto Research Campus (PARC) (e.g., Wynn-Whalen^[40–42]) directed attention to technologies as they are used in everyday work tasks. Xerox researchers conducted detailed studies on the use and role of technologies in the practical accomplishment of work

activities. Through studying workers' activities and interactions, they described how the workers themselves in practice produce the functionality of tools and technologies.^[43] Studies of the fine details of situated work practices proved to be productive for gaining guidelines for technology development. In addition to naturalistic workplace studies, Lucy Suchman's book *Plans and Situated Actions*^[44] had a major influence in the emergence of the practice theory.

Suchman^[44] argued that the formal plan-based models of work task performance which guided studies in artificial intelligence (AI) and cognitive science had failed to consider the immediate context of work activities. Plans, cognitive schemas, scripts, and rules are not static but dependent on the situations in which they are invoked. These do not determine conduct but provide a resource through which people orient in diverse situations and interpret their action and the conduct of others. Suchman argued that formal models of work tasks disregard the contingencies which inevitably arise in real-life problem-solving and ignore the improvisational, interactive, and situational character of individuals' reasoning. This is nevertheless what accounts for the successful execution of work tasks.^[44]

The fundamental assumption in practice theory is that practices are always social. Even when people seemingly work alone and do not belong to any specific group, they rely on a complex body of socially shared skills and understandings.^[43] Views of what constitutes competent practice develop among a community of practitioners.^[45] Practices are therefore always organized in relation to significant others, who may be coworkers, coproducers, recipients, or customers. In this view, all work is collaborative, and the accomplishment of work requires some form of collaborative interaction.^[43]

The term practice refers to recurrent mundane activities through which individuals in situ become skilled workers or learners. Practice theorists define practices as embodied, materially mediated arrays of human activity centrally organized around a shared practical understanding.^[45] The practice approach is not oriented solely toward linguistic representations, since knowledge and expertise are taken to be both implicit, embodied in ways of performing work tasks, and explicit, formed in and through documents and face-to-face interactions. Practice theorists argue that conventional approaches to technical design have tended to underestimate the importance of the socially organized competencies and reasoning on which workers rely in using technologies as part of their daily work. Consequently, system designers miss important aspects of how the work is done that are critical for fitting and integrating technology into work processes.^[46,47]

Practice-based studies focus on the "work practice—artifacts/technology/material objects—human interactions" triangle. Assumption is that it only makes sense to study these in concert, that these are not isolatable. The practice theory of technology is first and foremost a theory

of technology-in-action. Studies adopting a practice approach are oriented toward gaining a detailed understanding of how groups organize their work practices through interacting with texts, coworkers, technologies, and other material objects. Consequently, the practical accomplishment of work activities is usually analyzed in its moment-by-moment emergence.

As observed earlier, many studies in this tradition focus on practices of producing, preserving, using, coding, categorizing, and filing documents for the purposes of work and in the course of work. Studies have placed equal importance on affordances of paper documents and affordances of electronic documents.^[48,49] The attention paid to the role of documentation and documents in the organization of work is exemplified by studies focusing on the production of medical records^[26,49] and practices of indexing of documents in a law office.^[25]

CONCLUSION

The ANT, SST, SCOT perspective, gender and technology studies and practice theories focus on different aspects of sociotechnical practices and processes. While the SST and early studies within the ANT focused more on historical studies and the early stages technology development, the SCOT perspective, gender and technology studies, and practice-oriented studies focus more on current practices.

Each STS theory has opened up new insights into the interplay between technologies and social practices. STS theories have introduced concepts that have enabled the taking of distance to everyday "natural" assumptions regarding technology. Concepts such as "heterogeneous engineering" typically function as labels designed to enable the effective transport of complicated ideas. However, STS theories and studies have often been criticized of heavy use of jargon and of having adopted a complicated style of writing. According to critics, this is an obstacle for a more widespread application of STS theories.

Compared to many theories of human information behavior within information science, STS theories contain a distinctly different view of what is problematic and what is not. The formulation of problems requiring study can be likened to the choice of languages and vocabularies for talking. Most of the time, we do not consciously choose the language or vocabulary we use but just do what comes naturally, use the language of our community. Information science languages and communities are many, however. As observed in the beginning of this entry, some information science topics are also STS topics and commonly approached and studied using the vocabularies that also STS communities deploy. Examples of such topics are classification, documentation, and recordkeeping practices. In some areas information science and STS concerns and research programs overlap, whereas in some research areas, languages and problem definitions do not overlap.

Within information documents, theories have been developed around the concept of information. Technology, in turn, has not been viewed as an equally important concept and object for theoretical work. STS theories extend the scope of theory building to the nature and affordances of technical artifacts. At the heart of STS is the idea that the social and the technical interact and mutually shape one another, leading to the notion that human–information interaction cannot be meaningfully studied as disconnected from technological systems. Another core idea in STS is that technological systems must be conceived very broadly as consisting of technologies-in-use, working practices, social relationships, and larger social/textual and technoscientific orders and processes.

Studies in STS have shown how technologies take shape through conflicts, negotiations, and alternative interpretations. STS theories allow seeing technologies as less closed, fixed, and stable. Looking at technologies as more indeterminate and open to reinterpretation encourages an active critical involvement in interpretative work and the recreation of understandings of how technologies could or should be redeveloped.

Search Engine Optimization

Nicholas Carroll

Hastings Research, Inc., Las Vegas, Nevada, U.S.A.

Abstract

Search engine optimization (SEO) is the craft of elevating Web sites or individual Web site pages to higher rankings on search engines through programming, marketing, or content acumen. This section covers the origins of SEO, strategies and tactics, history and trends, and the evolution of user behavior in online searching.

INTRODUCTION

Search engine optimization (SEO) is the craft of elevating Web sites or individual Web site pages to higher rankings on World Wide Web (WWW) search engines through programming, marketing, or content acumen. The definition often includes specifications for increased traffic to a given Web site, improved quality of traffic, increased profits, or brand awareness.

In a typical online search on a topic, anywhere from hundreds to millions of articles may be extracted and ranked by probability of relevance on a search engine results page (SERP). From the earliest appearance of Web search engines, creators of Web sites realized that ranking high was vital for visits to their Web sites, since users seldom look on even second or third screens of rankings, let alone the hundredth screen. The numbers of Web sites on the Web increased so rapidly from the beginning that the competition for the most desirable top positions developed rapidly.

In this entry, we move through several key aspects of SEO. First, we define “rankings,” and review the origins and history of SEO. Then we discuss what is known as “Black Hat” and “White Hat” SEO, as the competition for rankings can lead to distortions and misleading rankings, depending on what techniques are used.

The heart of the entry concerns SEO methods. We review keyword selection and then attend to various aspects of the content of the Web pages, such as keyword density, placement, and consistency. We then go on to the technical aspects and review techniques such as keyword stuffing, meta tags, and cloaking, as well as strategies for boosting page rank through links from and to other Web sites, with brief discussion of combined strategies and the analytic methods applied to track results.

The entry expands into more general issues such as broad vs. narrow targeting, page longevity and rank, geographic targeting, and increasing competition. Trends in SEO practices are described from early to present time, as are external trends affecting SEO.

We conclude with a description of SEO regulation, mostly in the form of search engines policing their listings, and an overview of typical behavior patterns of search engine users.

All the methods described have been or continue to be effective SEO to some degree. Changes in search engine indexing protocols as well as their methods for displaying search results mean that no strict description of the best method or methods can remain entirely accurate indefinitely. This entry does not cover pay-per-click, other forms of online advertising, or the resale of Web site traffic or links.

Because the discipline originated in the mid-1990s, terminology is still in flux. General references at the end of this entry point to the more authoritative Web sites and definitions.

DEFINITION OF HIGHER RANKINGS

“Higher rankings” in the popular press or lay discussion generally equates with the goal of having a Web page appear in the first 10 or 20 search records for a particular search term, as it is broadly established by tracking that few search engine users will click through to any link beyond the 20th record. SEO professionals usually discuss rankings in terms of SERP position (Fig. 1).

Before search engines accepted paid advertisements, SEO was considered a unique form of promotion, radically different from all traditional forms of advertising. It is now more often considered a subset of search engine marketing (SEM), and is sometimes referred to as “organic search” or “natural SEM,” as opposed to paid advertisements placed on the pages of search engines or their affiliates.

Online commerce was the originating force behind search engine promotion and remains the primary driving force behind SEO. Nonprofits and government bodies apply some SEO methods but tend to rely on their unique identity to assure them a prominent SERP position,

ORIGINS AND HISTORY OF SEO

The term “search engine optimization” came into popular use in 1997–1998 and is frequently attributed to Danny Sullivan,^[1] then operating “Search Engine Watch,” though Sullivan states he is uncertain who coined it. Previous terms included “search engine placement,” “search engine ranking,” “search engine positioning,” and “search engine promotion,” the latter attributed to Jim Rhodes,^[2] author of “The Art of Search Engine Promotion.” Predecessors such as Heath^[3] in his 1995 article “Pointers on how to create business Web sites that work” did not have a formal name for SEO.

The period from the mid-1990s to about 2000 was characterized by broad experimentation on the part of both search engines seeking a business model and Web site creators intent on promoting themselves. Search engines were relatively under-powered and minimally staffed; their primary focus was on keeping pace with the growth in new Web sites. SEO quickly became part of the American “wild, wild Web” metaphor, with more active Web site owners engaging in a huge variety of methods to gain higher rankings, as described in “SEO Methods.” In a period when many multinational organizations did not have Web sites at all, smaller and more nimble organizations and individuals aggressively practiced SEO to establish a beachhead on the WWW.

The early days of search engines were in some ways a struggle against pornography. Visitors who started using search engines after 2000 have little conception of how pervasive the online sex industry was at one time, with their records appearing among search results for cooking, art, quilting, travel, and other innocuous subjects.

As search engines have grown and become more sophisticated, and the number of Web sites has increased more than tenfold, aggressive maneuvering to rank well in the SERPs has to some extent given way to a focus on ranking well in particular niches, and executing well on fundamentals rather than exercising brilliance in manipulating search engines.^[4]

PRACTITIONERS AND SOFTWARE

Early Search Engine Promoters and Reporters

Early SEO innovation was an individualistic endeavor, primarily developed by small-to-midsize businesses ranging from small hotels to makers of custom sports equipment. Several such niche and popular products were financially successful, demonstrating that SEO was a path to profit.

Web sites with forums for exchange of SEO strategies began to appear by 1996, including still-existing Web sites such as <http://virtualpromote.com>, <http://www.searchengineforums.com>, and the archived <http://www.deadlock.com/promote>.

Web sites reporting on search engines and optimization began about the same time, including <http://www>.

wilsonweb.com, <http://www.searchenginewatch.com>, and <http://www.webmasterworld.com>. More recent additions include <http://www.seobook.com/blog>, <http://www.searchengineland.com>, and <http://www.toprankblog.com/search-marketing-blogs>.

The Current SEO Industry

Whether offered as a subset of SEM services or sold alone as organic search, SEO has become a niche industry with its own sales forces and conventions. The service may be sold as a one-time audit or on an ongoing basis with monthly billing and performance reporting.

Pure SEO consulting firms now number in the thousands, primarily concentrated in North America and the United Kingdom. Tens of thousands more Web designers and developers offer the service as ancillary to building Web sites, and an unknown number of Webmasters and Web site owners apply SEO methods to their own Web sites.

Gross expenditures on SEO in 2006 were estimated at over USD one billion, with steady annual growth anticipated. This figure describes organic search and does not include paid advertising or most in-house work in smaller companies.^[5]

SEO Software (Automating the Process)

Automated Web page submission tools came into being in the mid-1990s soon after search engines began indexing the WWW. For some years, they were a vital part of SEO strategy for large Web sites, as manually entering thousands of URLs into the submission pages of a dozen search engines was extremely time-consuming. Submission tools fell into disuse as search engines became more adept at “deep crawling” (following links into the lower levels of Web sites’ file hierarchies). The ones currently in use typically offer additional features such as help in choosing keywords and automated reporting on SERP positions.

Web analytics tools move beyond automated reporting to features such as tracking visitors’ paths through Web sites, and integrating the data with financials.^[6]

Most content management systems, originally focused on intranets, now include management features for Web sites, and many are programmed to allow a significant modification of variables important to SEO.^[7] Likewise most blogging software includes features that encourage users to add keywords to the title tags, the Web page body, and the filename of a given Web page.

SEO Worldwide

While search engines are now used worldwide, most SEO reporting is about the United States, Canada, and the United Kingdom. Activity in other countries must be inferred. Australia, Ireland, and Russia in particular have

significant indications of entrepreneurial SEO, including blogs on the subject.^[8]

BLACK HAT VS. WHITE HAT SEO

“White Hat” SEO typically refers to strategies and tactics that are in concordance with the policies of online search engines, in a loose tacit agreement to provide Web surfers with “relevant content.” “Black Hat” SEO describes tactics that ignore generally accepted conventions of ethical WWW behavior to advance an agenda or commercial interest. The focus on search engine policies before other interests flows from the pervasive position of search engines, at the mid-point in the process of aggregating Web page data and delivering it to users. The tilted point of view is buttressed by the oligopoly of major search engines, with a small number of them processing the vast majority of searches, while millions of Web sites vie for high rankings.

Technically sophisticated tactics are often equated with Black Hat SEO, and a focus on high-quality content with White Hat SEO. However, there is substantial overlap; few if any tactics can be inherently classified as good or evil. From the perspective of a user, the main criteria of legitimate SEO is whether a given search return is relevant to their interests, regardless of how it achieved its ranking. Most experienced SEO practitioners consider intent to be the defining factor.

Typically, methods considered Black Hat SEO develop high page rankings faster, while those known as White Hat SEO tend to create longer-lasting rankings. A preference for one approach or the other is not entirely a matter of the SEO practitioner’s personal preferences; it also depends on the business model. Web sites or pages promoting products and services with short life cycles are suited to Black Hat methods, as they do not suffer from being “burned,” meaning they have drawn the attention of search engine administrators and been banned from that search engine’s index entirely. (This has also happened to sites of long-view organizations such as auto manufacturers when SEO subcontractors acted with an excess of zeal.)

White Hat SEO is better suited to Web sites that offer products with long life cycles. It is also suited to academic or government Web sites, where there is likely to be a consistent focus over decades—such Web sites often gain high and enduring SERP rankings simply by publishing high-quality content about a particular subject.

SEO METHODS

In describing SEO it is necessary to distinguish between automated search engines and manually created directories such as Yahoo! Directory (<http://dir.yahoo.com>) or the Open Directory Project (ODP) (<http://www.dmoz.org>),

where listings are added by human editors rather than automated protocols.

SEO describes strategies and tactics for influencing page rank on search engines that use “robots” (<http://www.robotstxt.org/wc/faq.html>) or “spiders” to “crawl” Web pages, traveling from page to page through hyperlinks, and indexing those pages by algorithms and protocols. While directories such as the original Yahoo! Directory can be searched from within Yahoo!, and the ODP pages can frequently be found in SERPs, it is the manner of creating the index that differentiates search engines and directories.

Elements of a Web Page to Be Optimized

The following example of HTML (Hypertext Markup Language) is referred to throughout this entry. The markup language and page structure used are explained in Table 1 below the example. (Web page structure can be

viewed in almost all Web browsers by selecting the “View > Source” or “View > Page Source” option.)^[9]

```

</html>

Choosing Keywords to Target—The Core of SEO

Regardless of preferred methods, White Hat or Black Hat, content or technical, the most critical part of effective SEO is deciding which keywords to target for high rankings. While search engines continually work to improve their ranking algorithms, they are not clairvoyant; targeting the right keywords is still the foundation of reaching the right audience.^[10]

A self-centric viewpoint will usually lead an organization to aim at high rankings for its own name, services, agendas, or products. For example, the Raffles Hotel or the band U2 might focus on targeting searches for their own name, in a reasonable belief that most potential customers are specifically seeking them, rather than hotels in Singapore or rock music in general.

While this may be a successful strategy for broadly known organizations or people, it is considered poor-quality SEO when an unknown product, service, or agenda is being advanced. Products and agendas without name recognition are better served by targeting a generic search term such as “stainless steel ball bearings” than a term like “Smith Ball Bearing Company.” A multinational company such as General Electric or Hitachi—that manufactures a huge variety of products—might likewise target searches for the products rather than its own company name.

Regardless of whether the focus is on the organization or the products, SEO can fail when names are chosen without forethought to online search, particularly when they compete with long-established names. Two examples:

- Any product named “Guardian” must compete in the SERPs with dozens of well-established newspapers throughout the English-speaking world.
- Organizations using initializations that might be unique in a local telephone directory frequently face obscurity when competing for recognition in a global medium—“ABC” is not only an initialization for the

American Broadcasting Company, but hundreds or thousands of other organizations throughout nations that use the Roman alphabet.

This leads to a fundamental truth about the limits of SEO as a promotional avenue: it can only succeed if people are searching for relevant keywords. If an idea or product is beyond the public’s conception, it cannot be promoted through search engines—in contrast to promotion through traditional untargeted media such as radio, TV, or print. This usually makes SEO a poor method for promoting radically new ideas. For example, “anti-gravity belts” is a search only used by 10-year-old boys.

When possible, experienced SEO practitioners perform keyword analysis before a Web site is built, expanded, or redesigned, using paid or free online tools such as <http://www.keyworddiscovery.com>, <http://www.wordtracker.com>, <http://inventory.overture.com/d/searchinventory/suggestion/> or <https://adwords.google.com/select/KeywordToolExternal> to view aggregated searches conducted on search engines.

Content

At its simplest, the content-focused approach to SEO is to tell the story thoroughly and precisely, in hopes that the words (content) will find a fit with search engine indexing algorithms, and rise in the rankings for particular search terms. The presumption in this strategy is that the writer’s words will also find harmony with the terms used by searchers, and if the writer does have the same interests—and frame of reference—as the target audience, this by itself can result in highly successful SEO. (Conversely, Web pages written in ignorance of either subject matter or audience may achieve high SERP positions, but not necessarily for the keywords that draw the desired audience.)^[11]

A highly content-oriented strategy is often seen in Web sites that were conceived and designed by an individual or small group. Content-oriented Web sites or sub-sites may also come into being in an organization with no SEO strategy at all, such as a department of a university, where the authors are discussing the same or related subjects.

Density

Keyword density receives attention because it is easy to understand and simple to calculate through online density-checkers such as <http://www.keyworddensity.com>. (Such tools are easily found through search engines with the term “keyword density analyzer.”)

Though the effectiveness of intentionally repeating keywords throughout a Web page is debated by SEO practitioners, a search for highly promoted products such as “loans,” “chocolate,” or “discount shoes” will return numerous high-ranking Web pages with the core keyword repeated dozens of times, and keyword densities reaching up to 7% or higher of the page’s content. (However, exceptionally high-density pages can suddenly plummet in the

Science–Semantic

SERPs or be dropped from the index entirely if search engines classify them as examples of “keyword spamming,” described in the Technical strategies section below.)

Conversely, using a set of keywords only once in a Web page usually results in SERP obscurity, even if the set is extremely precise. For example, even “dodo bird nesting” returns tens of thousands of Web pages, and of the first few dozen search engine records, almost all will have the three keywords used several times.

Many SEO practitioners and analysts favor well-written content over keyword density, as search engines become better at differentiating between conventional prose and deliberately enhanced Web pages. This school of thought says that content should be primarily aimed at humans, not search engines, and that good writing not only entices users to read and act, but is better search engine bait in the first place. The belief is often expressed as “Content is king.”

Placement

The placement of keywords in a Web page is a significant factor in SEO, since search engine algorithms accord more weight to certain positions, whether visible or within tags (see Table 1). Notable areas for placement include:

Visible in Web page

Inside heading tags <h1, h2, h3. . . >

Placed at the beginning (top) of a Web page.

Within outbound links, i.e., “anchor text” (example in Table 1).

Placed NEAR other keywords (generally within 10 words).

Visible in SERPs and browser title bar

Inside the HTML <title> tag.

As part of the URL

Competition over search terms and SERP positions has expanded the use of keywords to the point that they are now routinely made part of file names (e.g., <http://www.mysite.com/used-software-for-sale.html>), or may even form the domain name itself, e.g., <http://www.usedsoftwareforsale.com>.

The title tag is almost universally agreed to be highly important by SEO practitioners. Most other placements are debated. The <meta=“keywords”> tag is largely considered of no importance. The “alt” content in image tags is considered significant in image SERPs, less so in the overall ranking of a Web page.^[12]

Inclusion of related keywords

Due to the unpredictability of user search behavior, many SEO practitioners include synonyms, cognates, tangential terms, and misspellings in Web pages. In the mid-1990s, SEO practitioners placed such related keywords in the meta keywords field (see Table 1), but massive abuse and misuse

of that field led virtually all search engines to stop indexing meta keywords. As a result, SEO practitioners reluctantly turned to placing them as a visible footer on the Web page, though this compromises the esthetics of page design. Some examples of keyword (or “tags”) line listings:

Synonyms, cognates, and closely related terms for a medical page about trigeminal neuralgia, formerly called tic douloureux:

“Keywords: tic douloureux, neuropathy, facial pain, face pain.”

Tangential terms (statistical outliers) for a site on vegetarian diet:

“Keywords: low sodium, low fat, organic.”

Variants on the author’s name for a Web page written by Jon Smythe:

“Keywords: John, Smith, Smyth.”

Common misspellings for a travel Web site about Colombia:

“Keywords: accommodation, Columbia.”

(However, when a keyword tag is used to repeat words already in the body content, it simply becomes “keyword stuffing”—see “Keyword Loading” below.)

Consistency

Building a Web site with a consistent pattern of clearly related keywords is commonly known as creating a “theme.”^[13] A Web site with a clear theme stays on a single topic or closely related topics throughout its pages (barring such standard pages as “Contact Us”). This strategy builds the overall ranking of the Web site and, as a consequence, the SERP positions of the individual Web pages.

The concept “clearly related” restricts thematic rank-building to keyword relationships that search engines are capable of recognizing. Where “ship” and “marina” might begin to build a theme relating to recreational sailing, search engines would be less likely to recognize a theme in a Web page with the separate keywords “ship” and “space.” Once combined into the more specific keyword “spaceship,” the page becomes identifiable as related to science fiction or space exploration, and if the Web site also contains the words “galaxy” and “parsec,” a theme begins to build.

The interest in themes peaked around 2004, alarmists suggesting that Web sites without a keyword theme would plummet in the SERPs.^[14] However, there are exceptions to the rule: newspapers, encyclopedias, and many news blogs will never have a clear theme, yet they still can reach high SERP positions for a variety of keywords, based on meeting search engine criteria other than consistency of subject matter.

Technical

A technically oriented SEO strategy emphasizes programming skill or ingenuity over command of language, familiarity with the target audience, or interweaving related content. Tactics vary from the simple, which can be

executed by anyone familiar with HTML, to the sophisticated, which require knowledge of programming, Web site servers, or WWW and Internet protocols.

Keyword loading, stuffing, and spamming

Keyword density can be taken to an extreme. Efforts to increase keyword density or variety that involve excessive or awkward repetition are known as “keyword loading.” An example would be replacing every instance of “it” in a page with the noun in question.

When this repetition reaches the level of incoherence, with the same word or words used dozens of times in the body, title, or tags of a Web page, it is usually called “keyword stuffing” (a.k.a. “cramming”), “spamming the index” (“index” referring to the search engines’ databases of Web pages), or “spamdexing.” One of the earliest SEO tactics, it began with simply repeating keywords hundreds of times, generally at the bottom of the page, and frequently with the font color the same as the background color, thus rendering the text invisible to humans. As search engine algorithms began to discount this tactic, keyword spamming evolved into a more precise metering of keyword density. This obsolete technique periodically sees a resurgence as search engine administrators let down their guard.

The meta keywords tag

Located in the head section of a Web page’s HTML (see Table 1) and invisible to users viewing a Web page in a browser, the meta keywords tag was created purely for metadata.

In the mid to late 1990s meta keywords were highly popular as a quick path to higher rankings, and indeed stuffing the meta keywords field showed some success when only a few million pages were being indexed. By the time the tactic became broadly known—with “keyword-jacking” lawsuits over copyright and trademark infringement—search engines were on their way to down-ranking the meta keywords tag contents, and usually not indexing the keywords in the field at all.

Entry pages

“Entry page” is the broadest descriptor for the strategy of creating particular pages to rank well with search engines, sometimes finely tuned to rank well with a particular search engine. “Doorway page” and “gateway page” imply that a page contains some relevant content that has been tuned for high SERP position. “Bridge page” or “jump page” imply that a page may be little more than an uninformative landing page that either urges the visitor to click through to the rest of the Web site, automatically redirects them to the rest of the Web site, or redirects them

to an entirely different Web site.^[15] Most media coverage of such pages classifies them as Black Hat SEO. However, there is no clear agreement on the definition of these pages or their relative level of deception. Many SEO practitioners observe that while bridge and jump pages may be technical and possibly Black Hat as well, all pages visible to search engines are in a real sense entry pages.

Cloaking

“Cloaking” is used to describe a broad range of tactics. The common element is that the human visitor and the search engine spiders “see” different content when visiting a Web page. In the simplest form, the SEO practitioner creates a page tuned for high SERP position, and replaces it with a human-readable page after the page has been indexed by search engines (of course the artificially high ranking only lasts until search engine spiders visit the page again).

Two of the more technical methods, which attempt to deceive search engines on a continuing basis:

- *User-agent-specific page delivery*, in which the Web page server “sniffs” the incoming page request, extracts the data that identifies what browser the visitor is running (e.g., “googlebot” or “msnbot”), and delivers a special Web page tuned to gain higher SERP on that SE.
- *IP-specific page delivery*, in which the Web page server delivers a special Web page based on the visitor’s Internet Protocol address (e.g., “127.0.0.1”).

Cloaking is broadly considered one of the most aggressive and sophisticated forms of Black Hat SEO, but search engine analysts point out that even cloaking has legitimate purposes, as when a Web site is migrating to a new domain name; the owners may want to keep the old Web site available to the public until the new one becomes established in SERPs.^[16]

Linking

Links have become such an important determinant of SERP position that under some circumstances they may override all other elements of ranking, and catapult a Web page of little or no relevance to a top SERP position.

Link-weighting fundamentals

Since the mid-1990s, search engines have routinely tracked the links from (and to) Web sites, often assigning a relative value based on the links’ source or destination. Links pointing to a Web site are generally called “inbound links,” and links pointing to other Web sites “outbound links.” (Inbound links are frequently called “backlinks,”

though the term has other technical meanings in computing.)^[17]

“Link-weighting” is frequently described as “link popularity” or even “popularity” measurements by popular media. More accurately, search engine link analysis algorithms attempt to infer the value of a Web page or entire Web site based on four factors:

1. The number of inbound links.
2. The “quality” of the inbound links, based on the quality of the originating Web site. Assessing the quality of Web sites is where link-weighting moves into more sophisticated and sometimes arcane mathematics.^[18,19] In simple terms, an inbound link from a major university has more value than a link from an obscure small business, and has a greater beneficial effect on SERP position.
3. The “relevance” of the inbound link. A Web site about a baseball team benefits more by inbound links from other baseball-oriented Web sites than by links from the personal pages of fans.
4. The keywords contained within inbound links (the linked text visible in a browser), known as “anchor text.” The most famous example was the 2003 link manipulation of Google SERPs (known as “Google bombing”) in which hundreds or more Web site owners inserted the link `<a href="http://www.whitehouse.gov/president/gwbbio.html">Miserable Failure</a>` into their pages, causing the U.S. White House biography of George W. Bush to rise to the top ranking for the term “miserable failure.”^[20] (The gwbbio.html page rose to #1 ranking on Google for that term even though it did not contain either of the keywords in question.)

The cumulative importance of these factors in SERP position has led to naming the collective effect of inbound links “link juice” (American “slang definition of” “juice”: influence, clout, <http://www.m-w.com>.)

Web sites with many relevant or high-quality links pointing to them (inbound links) are known as “authority” Web sites; those with many links pointing to other relevant Web sites (outbound links) as “expert” or “hub” Web sites. The presumption built into the search engine algorithms is that a Web site with many inbound links from high-quality Web pages is an authoritative source, and that pages with many outbound links to authority Web sites serve as a WWW resource. (The mathematics can become circular and even self-reinforcing, as when <http://www.wikipedia.org> Web pages briefly started to dominate #1 SERPs positions for thousands of subjects.)

Strategies for leveraging links

Link-weighting was implemented to in effect create a weighted voting scheme and take some of the control of

rankings away from a Web site’s designer. Since weighting means that not all inbound links are of equal value to SERP position, the methodology also opened the door to SEO opportunities of bewildering complexity, in which Web sites buy, sell, and trade links to and from their Web sites in order to improve their SERP positions.

Always a factor in SEO, “link building” is now broadly considered a core element of strategy, and in some schools of thought the most important element.^[21] Increasing media attention brought linking as a SERP ranking factor to the attention of Web site owners and the quickly growing number of SEO practitioners, and today organizations spend substantial time and effort on link building aimed at high rankings.

Non-reciprocal links (a.k.a. “generosity links”) were the first evolution, in the mid-1990s. At that time Web site creators linked to almost any remotely related Web site, including their competitors. By the late 1990s “reciprocal links” had become the standard, though the exchange was offered with a view to a direct increase in traffic rather than SERP position.

Soliciting inbound links, at first done casually, now often means assigning employees or subcontractors to solicit links from high-ranking Web sites. The return on investment is questionable—high-ranking Web sites have little to gain by giving an outbound link, and the site owners may be concerned that linking to a low-quality Web site will harm their own rankings. (Soliciting links should not be equated with link building, a broader term that covers all strategies for gaining inbound links.)^[22]

The practice of posting links in discussion groups also originated with the goal of direct traffic rather than influencing SERP positions. “FFAs” (Free For All Web sites), “link farms,” and “link rings” were crude early link-exchange schemes, most variants indiscriminately exchanging thousands of links without regard to relevance. While such sites are still active, their value in SEO has largely been eliminated by increasing sophistication of search engine ranking protocols. Most SEO practitioners today consider participating in them to be useless at best, and at worst, possibly injurious to a Web site’s SERP positions.

“Paid links”—inbound links that have been purchased, sometimes masking as editorial recommendations—existed before the WWW on Internet bulletin boards, always with the intent of publicity or direct financial gain. With the broadening awareness of SEO, using paid links to influence SERP position has become both a business strategy and a source of contention between Web site owners and search engines.

Good content, the oldest link-building strategy of all, is a somewhat indirect way to build links. Coupled with even a modest amount of self-promotion beyond good SEO—or occasionally just with good content that perfectly targets a popular search—competent writing on a particular subject can generate hundreds or thousands of inbound links to a given Web page, often without any

communication at all with the Web sites that are giving the links. Because content-inspired linking may produce results slowly (in months or years), and is often difficult to quantify, few organizations devote serious effort to the method.

Web Site and Web Page Structure

The directory (folder) structure of an SE-friendly Web site looks similar to a clearly and logically organized hard drive on a personal computer, with the additional proviso that every document is directly or indirectly linked from the home page or some other prominent Web page. Ideally the structure is “shallow” (three or fewer sub-directory levels), to make it easier for search engines to spider, though that has become less important as all major search engines now perform deep crawling.

Actual page structure of HTML pages is in theory dictated by an adherence to W3C standards. In practice, Web sites use almost any markup code that can be rendered by a Web browser and leave the difficulties of indexing to the search engines.

There are drawbacks to unorthodoxy where search engine rankings are concerned. Use of highly irregular Web site structure, page structure, or file naming conventions can seriously harm SERP position. In extreme cases, search engines simply do not add a Web site to their indexes; poor Web site structure can be as destructive to Web site rankings as the most extreme Black Hat tactics, and “site maps” generated specifically to aid search engines in indexing a Web site are not a substitute for logical Web site structure.^[23]

Despite a broad disregard for standards among Web site owners, most SEO practitioners consider disciplined site and page structure fundamental good practice, though these are seen as a foundation for SEO rather than an SEO strategy in themselves.

Web Analytics

The most thorough SEO practitioners use “Web analytics” to analyze Web site traffic for patterns that can lead to enhanced SEO. While the term embraces areas more concerned with usability and user behavior while on a Web site, analytics sweeps in SEO functions such as keyword analysis and SERP position monitoring.

Data can be collected by “tagging” individual Web pages with Javascript and other programming, or by placing cookies on visitors’ browsers.

“Keyword analysis” is often initiated at the server level through “log analysis.” Because WWW communications protocols usually pass the full URL of the previously visited page to the destination Web site, the headers can be processed for search terms, and those terms then organized and further analyzed.

In either case, data is then analyzed manually, or with in-house programming, or with one of the many commercial Web analytics programs.

The data below is a sample of some of the information that can be extracted from Web site server logs: visitor’s ISP, visitor’s IP address, number of pages visited, time and date, visitor’s browser and operating system, the Web site the visitor came from, the search terms they used, and the landing page.

A visitor from “dynamic.dsl.com” (88.104.65.226) was logged twice, starting at 12:46:36 on Sunday, October 14, 2007.

The initial browser was Firefox/2.0.0.7 (Windows XP; en).

This visitor first arrived from <http://www.google.co.uk> while searching “ecommerce business models 1–10” and visited “digitalenterprise.org/models/models.html.”

There has been a general shift in Web analytics from log analysis to page tagging, in part due to the limits of log information compared with information gained by tagging, and in part driven by vendors of analytics software.

Combining Content, Technical, and Linking SEO

Strategies that combine all three forms of SEO may be the most effective in gaining high SERP positions. Combined strategies are uncommon because Web sites are normally designed without regard to SEO (although the most effective SEO is begun at the conceptual level), and because Web site owners and managers rarely allow significant changes to the structure or content of their Web sites after they are built and online.

An alternate way of viewing SEO is “on page” or “off page” SEO, the former being methods applied directly to Web sites and pages, the latter focusing on methods external to a Web site, such as link strategies.^[24]

BROAD ISSUES IN SEO

A number of strategic issues that may affect a Web site go beyond fundamental SEO tactics or current “best practices.”

Building Downwards vs. Outwards

Large or growing organizations face the question of whether to house all their Web pages under a single WWW domain, or to establish separate Web sites for different services, product lines, or agendas. An established organization with a strong brand will usually lean keyword targeting towards its own brand name in SERP positions, and thus benefit from housing all its Web pages under a single domain, whereas a newer organization with separate divisions would be more likely to establish separate Web sites for each product line or goal.

This is not strictly a business issue; a university establishing a new campus in a different city would probably create a new Web site for that campus, just as a business that sells to both architects and game designers might choose to divide its product lines into two separate Web sites. The university would certainly link its two Web sites for the link-weighting benefits; the company selling unrelated products might not link its Web sites at all.

Broad vs. Narrow Targeting and Long-Tail Terms

The potential benefits in targeting highly specific searches were known to SEO practitioners by 1995–1996. Bed and breakfasts were one of the earliest and most evident examples, showing how highly specific keywords (e.g., “bed breakfast Ireland Kilkenny”) could reach precisely the right audience.

Since the Web was still sparsely populated, the more skilled practitioners were able to gain high SERP rankings for broad searches at the same time as they targeted narrow niches. For example, in 1997, it was possible for an Irish bed and breakfast’s Web site to gain a high SERP position for both its own locale and Irish B&Bs in general. That grew more difficult with increasing competition, and today a search for “bed breakfast Ireland” will generally return a SERP dominated by bed and breakfast directories and associations.

The changing situation became somewhat better understood in 2003, when Zipfian distributions were mentioned in an article by Clay Shirky about “power laws” as applied to blogs.^[25] Power laws were later popularized as “The Long Tail” by an article in *Wired* magazine.^[26] With use of the term growing, many clients and SEO practitioners now refer to any three- to four-word term as a “long-tail

term”; others use the description more correctly to describe an uncommon search term.

There are now indications that the pendulum of interest has swung too far towards uncommon terms, and that organizations are targeting long-tail terms without a clear view towards long-term benefits such as memberships or profits.^[27]

Balancing Targeting and Serendipity

While some organizations have only one easily described product or agenda, for most organizations SEO can be too successful when it targets particular search terms so tightly that their Web pages can be found by little else. When virtually all traffic to a Web site comes from a small number of terms, analyzing incoming search terms becomes an exercise in analyzing what one already knows. Ideally, improvements in SEO create an increase in targeted traffic along with an increase in unanticipated search terms. While this can be analyzed in terms of Zipfian distributions, in proactive marketing it is better represented by the APUPA (Alien–Penumbral–Umbral–Penumbral–Alien) bell curve (Fig. 2).

SEO can also be too successful when a Web page captures a high SERP position on a major search engine for an extremely broad term like “health.” Where this might be satisfactory to a large organization like the U.S. National Institutes of Health, an organization focusing on a particular niche of health could be swamped with masses of unwanted Web site visitors and e-mail.^[28] Web sites deluged by unwanted traffic sometimes convert a liability to an asset by “reselling” the traffic or the entire Web site.

Lead Time and Longevity

Search engines rarely assign top rankings to newly indexed Web pages. A Web site can take months or even

Fig. 2 APUPA chart expressed in SEO terms.

Source: © Hastings Research, 2005.

years to reach its “natural” position in SERPs. This is sometimes called the “sandbox,” referring to the period a new Web site may wait for a good SERP position or even to be listed at all by a search engine.

Equally, search engines assign value to longevity, and older well-ranked Web sites dating from the 1990s can be notoriously difficult to dislodge from their SERP positions by new competitors.

Geographic Targeting

Geographic targeting through SEO had limited success through the mid-00s. Few early Web site designers made a diligent attempt to anticipate all the geographic keywords searchers might use, and those who did target searches with geographic keywords often used so many keywords (e.g., “London,” “Pimlico,” “Knightsbridge,” “Belgravia,” “Dulwich,” “Stratford,” “Paddington,” “Fleet Street”—and every other village and neighboring town) that the pages were treated as index spam by search engines, and down-ranked to obscurity. Other designers created dozens or even thousands of “mirror pages” (pages with substantially similar content), each targeting a particular locale, with the result that the pages were down-ranked for “duplicate content.”

In a cause-and-effect loop, users learned that searching by locale was nearly useless, and abandoned the effort (with the exception of specific travel destinations), leading most SEO practitioners to abandon their efforts at geographic targeting.

With the now-growing success of geographic targeting efforts by search engines—typically displaying maps showing physical locations—users have again started searching geographically, and most SEO practitioners advise making some effort to target searches containing geographic keywords, even though geographic searches may be defined by commercial databases rather than SEO efforts.

SEO Source Tracking

The wealth of data that accompanied visitors to Web sites led many ecommerce pioneers to think the perfection of marketing analysis had arrived. While this sometimes bordered on true for new businesses that were entirely WWW-based, the opposite turned out to be the case for large, established organizations already being marketed through advertising, mail, public relations, and retail outlets; the WWW added another layer of complexity to their market tracking. Due to its 24-hr availability, the WWW also creates a “smoothing” effect on response to promotional efforts, which can hinder analysis of event-driven spikes in visitor traffic.

Refinements in Web analytics have not entirely compensated for these factors, and in many ways Web site

traffic source analysis remains less precise than that of traditional promotion and advertising.

Increased Competition

The continuing growth in the number of Web sites and Web pages means newly created Web sites have increasing difficulty gaining rankings for common keywords, so their approach is often to use a fanciful domain name and drive Web traffic via social networking or publicity instead of SEO.

Aside from the natural growth in Web sites, huge numbers of “made for ads” (MFA) Web sites have been created for no purpose other than to make money by hosting online advertisements—they have no products, services, or agendas of their own. Because advertising revenue indirectly comes from organizations that pay for online ads, MFA Web sites often specifically target keywords used by existing organizations. Nonprofit informational Web sites such as Wikipedia (<http://www.wikipedia.org/>) also compete directly for many search terms, often gaining very high search rankings.

Search Engines Only Index Words

While search engines are often technically capable of distilling words when they are represented in images, and in theory from audio tracks, in practice they index words from readable text documents, file names, or metadata attached to other forms of electronic files. There is a persistent failure to understand this aspect of SEO, with many Web site owners believing that if the human eye can read the words or grasp the meaning, the search engines will correctly index the files.

Further restricting SEO, search engines by choice index only certain types of text documents or metadata. At one time that meant pure text or HTML only. Most search engines are now willing to crawl and index file formats such as PDF (Portable Document Format), Microsoft Word and Excel, and in some cases Flash.

TRENDS

Fading Trends

“Meta keyword tags” were the first major chimera in SEO (“The meta keywords tag” earlier). They have been followed by other imaginary fast-tracks to high SERP position, all beginning with a grain of truth then blown out of proportion.

“Google PageRank” has been one of the most persistent areas of focus in SEO. Because of media attention and the easy access to the publicly visible PageRank via the Google Toolbar, the scale has commanded a great deal of interest from Web site owners, many of whom consider the published PageRank a practical scale for performance-

based SEO contracts. Most SEO professionals now consider public PageRank in itself a minor factor in a Web site's actual SERP positions, more an effect than a cause. The latter opinion is to some extent corroborated by Google, Inc.^[29] Over the course of 2007, countless Web sites saw their Google public PageRank drop significantly, which may further diminish interest in the measurement. ("PageRank" in popular usage should not be confused with "pagerank," an internal Google term.)

Web site "traffic"—whether measured in "hits" (requests for individual files, whether pages or images), "page views," "unique visitors," or the dot-com measure of "more eyeballs"—is slowly losing its popular connection to rankings, as organizations focus on conversion rate of users' visits to desired actions. (In extreme cases, traffic volume will have greater influence on SERP positions than relevance; however, this is uncommon and often results from a situation such as a major news event, where the boost in rankings may be due to a proliferation of inbound links, rather than traffic volume itself.)

Current Trends

Link building previously described in "Link-weighting fundamentals"

Pursuing "long-tail" searches (previously described in "Broad vs. Narrow Targeting and Long-Tail Terms")

Bringing SEO in-house: Major companies in North America and Europe are increasingly bringing SEO in-house as their online sales grow to (USD) millions or hundreds of millions. Companies are hiring in consultants, training current employees, or both.^[30]

Using best practices: Clients and employers are now commonly asking that practitioners follow "best practices." For SEO, the term describes such basic practices as prioritizing meta titles and heading tags, including keywords, and avoiding discredited (Black Hat) tactics.^[31]

Tuning metadata for search engine interfaces: Increasingly, practitioners structure Web pages so that titles, descriptions, and filenames are presented appealingly on SERPs. Eye-tracking studies, where eye motion is represented by printed "heat maps," are currently the basis for most decisions in tuning metadata.^[32]

Tagging Web pages: adding keywords or allowing visitors to add keywords to the visible text—is common on many social networking Web sites and some ecommerce and media Web sites, but has shown mixed results in improving SERP positions, possibly due to the indiscriminately chosen keywords selected by lay users, Web site owners, and bloggers. Tagging may benefit SERP position most for Web sites that encourage commentators to use "controlled vocabularies."^[33] It may also boost SERP positions for "long-tail" search terms.

Web 2.0 designs: Web 2.0 methods have been criticized as being detrimental to SEO. This criticism has arisen with

each evolution in Web site development, from "dynamic page delivery" (assembling Web pages from databases "on the fly") through Cascading Style Sheets and PDF files. In most previous instances, organizations' design preferences have won out over SEO considerations, and eventually the major search engines have adapted their protocols to classify new Web page structures and document formats.

Since search engines do not immediately retool for new forms of Web page markup and structure, Web sites that employ Web 2.0 methods such as AJAX (Asynchronous Javascript and XML) or that stream together content from different sources ("mashups") may drop in SERP positions until search engines decide how to interpret these new document structures.

Trends Affecting SEO

New search engine presentation methods

Clusters of search records such as those displayed by <http://www.clusty.com> or <http://www.ask.com> are likely to continue improving in relevance; if they increase in popularity, each cluster link will constitute a second-tier SERP, and SEO may begin targeting particular clusters.

Drop-down *contextual search suggestions* are now offered at <http://www.ask.com> and <http://www.yahoo.com>. Because users see contextual suggestions as they type, even before seeing the first SERP, "contextual position" may become a sought-after goal of SEO. Since contextual suggestions are all displayed on the first screen of a search engine's Web site, without the need for scrolling down, position is not likely to be as critical as SERP position, and "contextual inclusion" may prove to be the desired goal. (Contextual search flows from a given search engine's database of "most likely" requests; it should not be confused with the URL suggestions that Web browsers make by accessing a user's own search history.) (Fig. 3)

With exceptions, such as the European search engine Kartoo (<http://www.kartoo.com>), interfaces such as topic maps and link maps show little sign of entering the mainstream of WWW search, and thus do not affect SEO.

Blended search—the blending into the primary WWW SERPs of news, images, maps, videos, and other types of records once considered niche searches—have now been instituted by major search engines.^[34] This presents

opportunities to the more aggressive SEO practitioners, some of whom are attempting to dominate blended SERPs with a mix of varied data formats. (Blended search has also been called “universal search.”)

Specialized searches

Specialized searches have been offered for decades through pre-Web online information providers. They are often called “vertical searches” (i.e., niche search). Specialized search could disrupt current SEO strategies, whether it is offered by major search engines or niche suppliers. First, if niche searches or tools proliferate in the GYM group (Google, Yahoo, Microsoft)—each with its own classification protocols—they may dilute the value of SEO methods that address the GYM standard algorithms. Second, niche search engines such as <http://www.vivisimo.com> have entered the search race, and others such as <http://www.northernlight.com> (founded 1996) are reentering public search; these specialized search engines are usually less susceptible to technical methods, as they tend to use proportionately more human editing than broad reach search engines. Either trend could diminish the importance of technical- or link-based SEO.

“Personal search” has been a holy grail of the Internet industry since the mid-1990s. Early attempts at personal search included Yahoo! personalization features and numerous failures in “push technology” (Push technology: A means of automatically delivering information via the Internet to subscribers based on their choices for customized news, etc. *Webster's New Millennium Dictionary of English*, 2007. Described by H.P. Luhn as “SDI” (Selective Dissemination System), <http://www.ischool.utexas.edu/~ssoy/organizing/l391d2c.htm>, accessed February 2009). The current trend is towards analyzing individual users' search requests in the context of their previous searches (remembered by the server) and delivering customized results. Taken to an extreme, this could theoretically filter out a majority of available Web pages regardless of the SEO efforts invested, as search engines “learn” to focus on individual users' core interests.

“Local search” (geographic search) has become a serious goal for search engines. However other than travel destinations, few small retail businesses have Web sites, so search engines cannot easily find data for them by crawling the WWW. The primary solution to date has been to buy or barter for data such as traditional telephone book databases. Other new local search companies are aggregating local data for search engines, often crawling online local directories for source data search engines themselves are encouraging data entry from local organizations. Some trades with guilds such as law or medicine have niche Web sites with search functions; as yet few are comprehensive. Trades without guild organizations such as auto repair or beauty services may depend entirely on the success of aggregation if they are to be located through broad search. In few of these cases do current SEO

methods provide a clear path into SERPs, and paid listings may vie with SEO in creating online exposure for local businesses.^[35]

Alternate search channels

Alternate search channels could have an even more dramatic effect on SEO practices than blended or niche search services:

SEO for mobile communications devices: Analysis of users' WWW search behaviors on mobile devices has shown an emphasis on local retail search followed by entertainment. Coupling mobile search with GPS navigation feedback opens the prospect of delivering content or ads raises the prospect of directing mobile users to the nearest restaurant or a movie showing, thus both of these searches are potentially lucrative advertising venues—search engines are pursuing them, and SEO will follow. It is not yet certain whether search engines will convert conventional Web pages to mobile-friendly formats, or whether organizations will have to create new pages specifically targeting mobile devices.^[36,37]

SMO (Social Media Optimization): It is arguable how much SMO involves “search” in the sense of users searching by keywords, because the spread of information on social networking Web sites is largely viral (self-promotion coupled with word-of-mouth). SMO is currently practiced by creating profiles on popular social media sharing and news Web sites, building a large base of “friends” and contributing unique promotional content with the option for other community members to vote in favor or against. Popular content that goes “hot” is placed on the high traffic home pages of the social media sharing and news sites, sometimes generating tremendous amounts of exposure, direct traffic, and secondary effect inbound links from bloggers that post about the content. SMO also involves using software to make posts automatically, this latter method being simply spamming. There may be a growing synergy between SEO and SMO, and SMO may become a parallel profession lumped under the umbrella of SEM.^[38,39]

STANDARDS AND REGULATION IN SEO

The practice of SEO is marked by the absence of standards, other than those imposed by the willingness of major search engines to index Web pages, their level of effort in returning the most relevant Web pages, and punitive actions (down-ranking or de-listing) taken against what search engine administrators consider unacceptable manipulation of SERP positions.

HTML

Standard Web pages (HTML) are in theory defined by W3C standards—which are largely ignored by both Web

developers and amateurs. Other formats now being indexed by search engines—including PDF, Microsoft Word and Excel, and still images and videos—follow even fewer standards.

Certification

Certification is in beginning stages. Some businesses have begun offering SEO credentials, and accredited colleges are now beginning to offer courses in SEO.

SEO Industry

The SEO industry may be loosely divided into SEO professionals of varying ability; Web designers and programmers who know the rudiments; and a much more visible group of low-cost SEO companies that operate through advertising and e-mail marketing.^[40]

While there are no formal standards or regulation, informal standards are slowly evolving through consensus of trade associations and Web sites reporting on SEO. (See “Bibliography” at the end of this entry.)

Search Engines

Because it is difficult to mathematically determine whether a given Web page’s content accurately reflects the page’s relevance to visitors (much less the creator’s true agenda), search engines have faced and continue to face an impossible task in down-ranking deceptive pages without penalizing legitimate ones. (In the classic if now simplistic example, a medical Web site can unwittingly trigger an algorithm aimed at filtering out pornography pages.)

Attempts to “game” (manipulate) search engine rankings have been so relentless, from the first significant appearance of online search engines, that many experts consider search engine administration to be equally a process of excluding Black Hat pages and elevating relevant pages.^[41] While penalizing irrelevant content faces the same problem as returning relevant content—a struggle to develop artificial intelligence—most search engines strongly downgrade Web sites that are found to be using the more technically complex SEO tactics such as IP-specific page delivery (see “Cloaking” earlier).

This issue of controlling Black Hat SEO without penalizing White Hat SEO is a continued source of tension between search engine administrators and SEO practitioners. Search engines selling advertising space on their own SERPs has exacerbated the tension by raising the issue that pursues traditional media, of whether there is a true division between editorial and advertising departments (or search relevance and advertising, in the case of search engines).

Like the evolution of military tactics, regulation is a game of innovation and counter-measure. The counter-measures may make a given tactic so ineffective that it is

completely forgotten by both attackers and defenders, at which point it may be reintroduced by the attackers. (A medical analogy would be the mutation of microorganisms in reaction to new antibiotics, accompanied by the resurgence of forgotten diseases when society no longer guards against them.)

Government Regulation

At present there is no hint of SEO regulation. As subcontractors, SEO consultancies are in a position similar to advertising agencies—with no actual control over organizations or distribution channels—so any government regulation is likely to flow indirectly from regulation of Web sites themselves (trade practices) or of search engines (particularly in the United States, where antitrust law may affect conglomeration of major search engines with software, hardware, or media companies).

USER BEHAVIORS IN SEARCH

User behavior while searching online shows more consistency than change in the period from 1995 to 2008. This section will briefly address the consistent behaviors and available research on the course of changes.

Users’ search behavior has a strong effect on SEO, since many users click the first listing in a SERP. On the other hand, gaining a #1 SERP position for a particular search term does not guarantee that a user will click that link; they might click the #2 link or the #10 link if those page titles, descriptions, or URLs are more compelling.

In the same vein, there is no clear evidence that users who click the first record will take further action; many SEO practitioners believe the more motivated users will scan an entire SERP before deciding which link to click. Regardless, user behavior while visiting SERPs affects SEO decisions as well as the search engines’ goal of relevance.

Research into specific behaviors has revealed a great deal about what users do in the specific environment of a search engine interface when tested in a laboratory setting. It leaves unanswered many questions about why users search the way they do—in part because most research has focused on what users do when looking at a SERP, without inquiring how or why they arrived at that particular SERP, or what actions they take after clicking a particular link. More research is required to develop consistent conclusions. Substantial research from information science has yet to be incorporated in SEO; when it is, it may transform strategies and tactics.

Variables that affect user search behavior:

- Users’ level of subject knowledge.
- Improvements in results returned by search engines.
- Users’ confidence in the quality of search results.

- Degree of users' sophistication in search.
- Presentation style of individual search results (title, description, URL, etc.).
- Motivation/curiosity/laziness.
- Habituation among users (hardening behaviors).
- Search engine interface design.
- Number of search engines available.

Basic Behaviors

Few users methodically click search results in sequential order, from the first result to the bottom of the page. Typically they skip over unappealing titles or URLs, and may bounce back and forth between organic search listings and paid listings. (Depending on SERP design, users may not always know the difference between paid and organic listings.) If a relevant Web page is not found quickly, users may change search engines, change their search term, or migrate to a general information Web site such as a dictionary, encyclopedia, or user-fed Q&A Web site.

Searching Popular Subjects

Patterns of search seen on Wordtracker, Yahoo! search tool, or KeywordDiscovery continue to show a preponderance of searches for celebrities and popular news, as described since 1999 in the weekly "Lycos 50" listing of the most popular topical searches (<http://50.lycos.com/archives.asp>) with written analysis and opinion. Google Trends (<http://www.google.com/trends>), which shows the number of searches for chosen terms in chart format, is well-suited to display spikes in interest, relative interest in different subjects, or seasonal patterns in popular searches; like the Lycos 50, it demonstrates that a huge proportion of Web searches are for popular subjects rather than niche information.

Use of Boolean Syntax

In the 1990s, WWW search engines typically limited the use of search syntax to Boolean AND, OR, and NOT, with OR as the default. (With AND or NOT typically applied by +/- symbols.) Initially these options were only available by typing them into the search term entry box. HotBot search engine was one of the earliest to offer Boolean logic to untrained users, with the addition of a drop-down box offering AND as well as "exact phrase" options, but the options were rarely used.

In the late 1990s, search engines moved towards a default (or forced) Boolean AND; by early 2003, it was the default on all major search engines search engines.^[42] Although this change narrowed search results, it also hugely increased the relevance of results, and, at the same time, reduced the average user's motivation to learn

Boolean syntax. Some data samples suggest that Boolean search skills are known to a smaller percentage of users today than in 1997, though it is uncertain whether the decrease is due to a loss of interest in search syntax or an influx of less sophisticated users.^[43]

Search Engine Loyalty

Available statistics strongly indicate that users are now more likely to refine or expand their search term than switch to another search engine.^[44] The disinclination to switch is often called "loyalty" in a broad sense; motivating factors could be the generally improved quality of search returns over the last few years, or users' increased recognition of the value of using precise search terms. In terms of user behavior, this could be described as a slight shift from "berrypicking" (wandering about and collecting bits of information) to more linear search behaviors.^[45]

Hardened User Behaviors

Users' search behavior search engines may have become "hardened," or fixed, by their expectations, in particular in the United States and Canada, because the majority of popular search engines have presented returns as linear lists since the mid-1990s. Current SEO is predicated on the idea that users type keywords into a box, click a "Search" button, and scan a list from top to bottom.^[46] Because they represent a large conceptual shift, interfaces that present information in clusters, topic maps, or relationship maps face an entry barrier.

User Behavior Worldwide

Patterns of user behavior outside the United States and Canada do not show identical evolution. While less analysis has been done, in regions as disparate as England and China users are apparently more willing to examine entire SERP pages, as well as second and third pages, and less likely to click on the first or first few SERP positions.

CONCLUSION

Beginning in the mid-1990s, SEO evolved from placing random keywords in all possible parts of Web pages, to more focused doorway page strategies targeting particular keywords. By 2000, improvements in search engines were rendering most of such tactics obsolete, and SEO practitioners moved on to the integration of overall Web site structure, and then on to establishing a Web site's relationship with the WWW as a whole through linking.^[47] For most, the reluctant and secondary focus of SEO was on users or quality of content. For others, a focus on user experience as well as SEO provided long term, sustainable results throughout the evolution.

SEO now faces broad changes in search and user behavior. The growth of online information is outpacing the indexing rates of all search engines. Search engines are struggling to deal with that overload, and in the process changing their strategies about what information to present and how to present it. Hardware—notably mobile communications devices—is redefining the technical limits of information presentation and also creating niches in user search behaviors.

Search Engines

Randolph Hock

Online Strategies, Annapolis, Maryland, U.S.A.

Abstract

This entry provides an overview of Web search engines, looking at the definition, components, leading engines, searching capabilities, and types of engines. It examines the components that make up a search engine and briefly discusses the process involved in identifying content for the engines' databases and the indexing of that content. Typical search options are reviewed and the major Web search engines are identified and described. Also identified and described are various specialty search engines, such as those for special content such as video and images, and engines that take significantly different approaches to the search problem, such as visualization engines and metasearch engines.

INTRODUCTION

Web search engines, for the public at large, have come to be perhaps the most frequently used computer services for locating information. To some degree, the same is true for many researchers, information professionals, and others. To most effectively and efficiently utilize these services, some understanding of the structure, makeup, content, features, and variety and breadth of these services is essential. This entry addresses those various aspects including just what is meant by "search engines," the components of a search engine, and typical search features, and it provides a profile of the major general Web search engines and a look at specialty search engines, visualization engines, and metasearch engines.

is a result and artifact of the history of search engines, but recognition of the ambiguity is necessary for an understanding of the current nature of such services.

Search engines vary in a number of ways and most could be considered to fall into one of four categories: general Web search engines (which have the purpose of searching a large portion of all pages that exist on the Web), specialty search engines (which focus on searching a specific kind of document, file type, or sources from a particular subject or geographic region), visualization search engines (which furnish diagrams, images, or other "visuals" to show relationships among the items in a particular set of retrieved items), and metasearch engines (which gather together the search results on a specific topic from multiple search engines).

WHAT IS MEANT BY "SEARCH ENGINES"?

The term "search engines" can have a variety of meanings, in the broadest sense referring to any computer program that facilitates the searching of a database. In the context of library and information science, however, the term has come to primarily refer to "Web search engines," that is, those services on the Web that allow searching of a large database of Web pages and other Web content by word, phrase, and other criteria. (For this discussion, hereafter, "search engines" will be taken to refer to "Web search engines.") A certain level of ambiguity becomes apparent, however, when it is realized that what is often referred to as a "search engine" is often a reference to the overall service that is provided, beyond just a search of websites. ("Google" is thought of not as just the searching part of the Google enterprise, but the many added features and content as well.) It is often impossible and unproductive to discuss the narrower "searching" part without discussing the broader range of services. That ambiguity in terminology

COMPONENTS OF A SEARCH ENGINE

General Web search engines and specialty search engines can be considered to have four major components that correspond to the steps required to create the service: 1) the identification and gathering of the material (Web pages, etc.) to be included in the engine's database; 2) an indexing program and the corresponding generated indexes; 3) the searching and ranking algorithms; and 4) the user interface. In understanding the history and the capabilities of search engines, it is important to note the rapidly increasing role played by artificial intelligence and related areas such as natural language processing (NLP) in the development of these components.

Identifying Material to Be Included

Search engines identify those Web pages (and other items) to be included in the service's database by two means: "crawling" and submissions of pages. The first,

“crawling” consists of having programs (“crawlers” or “spiders”) that on an ongoing basis scan the Internet to identify new sites or sites that have changed, gather information from those sites, and feed that information to the search engine’s indexing mechanism. The crawlers start by examining pages that the service already knows about and looking there for “new” links (links that the service does not already know about). When such links are identified, the pages to which the links led are likewise examined for “new” links, and so on. More popular websites (such as those that have lots of links to them) may be crawled more thoroughly and more frequently than less popular sites.

The second way search engines identify new items to be added to the database is by having website owners (or others) “submit” sites or pages. Most engines provide a form by which this can be done. Search services maintain their own policies as to whether submitted (or for that matter, pages identified by crawling) will indeed be added to the database, particularly looking to exclude unacceptable content (spam, sexually explicit material, etc.)

Search Engine’s Index and Indexing Program

After a new or changed page is identified by the search engine’s crawler, the page will typically be indexed under virtually every word on the page (up to some usually undisclosed limit). In addition to text words, other parts or characteristics of the page may also be indexed, including the URL (uniform resource locator, the “Web address”), parts of the URL, links, metadata found in the “head” of the document, the URLs of links on the page, image filenames, and words in linked text. By identifying and indexing these pieces of data (pieces or characteristics of the Web page or other type of indexed document, such as an Excel file), they become searchable “fields,” thereby allowing users to use those fields to increase the quality of their search. The search system may also “derive” additional fields, such as language, by analysis of the document. Analysis of the document utilizing NLP techniques also allows the indexing of the document under other terms not necessarily found in the document (but implied by the text) and also allows more precise indexing by identifying specific “entities” (people, places, companies, etc.)

The Search Engine’s Retrieval and Ranking Algorithms

By narrow definition, the actual search “engine” is the search service’s retrieval program, that is, the program that identifies (retrieves) those pages in the database that match the criteria indicated by a user’s query. That identification function is necessarily supplemented by another important and more challenging program that is used to determine the order in which the retrieved records should

be displayed, based on measures that try to identify which retrieved records (pages, etc.) are likely to have the highest relevance in respect to the user’s query.

This “relevance-ranking” algorithm usually takes many factors into account.

Exactly what factors go into the relevance-ranking process varies, but they include the use of keywords in titles, text, headings, etc., popularity of the sites (how many and which sites link to the site), words used in anchors (clickable text), internal links (how many and what kind of links within the larger site point to the page). Google led the field (and to a significant degree gained its reputation for high relevance) by putting high emphasis on “links”, particularly on the “popularity” of a page based on how many pages linked to the site and the popularity of the sites that were linking to the page. Increasingly, the use of artificial intelligence has become a major factor in determining ranking. Ranking of results is determined to some degree (often a very high degree) by “who” is searching—the user’s location, search history, etc.

The success or the failure of the relevance-ranking algorithm is critical to the user’s perception of the search engine, the user’s continued use of that system, and the commercial success of the engine.

The Interface Presented to the User for Gathering Queries

This interface the user typically sees includes the home page of the search service and other pages (such as an advanced search page) that present search options to the users and accept the users’ search queries, as well as the search results page. The search service can choose to have their page focus almost exclusively on “search” (as with Google) or be a more general, wide-reaching “portal” page, providing much more than just searching capabilities. (The “portal” dilemma for search services will be discussed in more detail later.)

Regardless of what other services and information are provided on the service’s home page (or mobile app), the “searching” part usually consists of a single search box plus links to other searchable databases that are made available by the service (images, video, news, etc.). Usually, there are also links to “help” screens, etc. While the simplicity of a single search box appeals to the less experienced user, the search box also usually provides substantial, but not obvious, capabilities for extensive searching sophistication, such as the potential for using Boolean logic and “prefixes” (e.g., “title:”) to perform field searching and other functions. An advanced search page may also be provided, which can much more explicitly lay out the possibilities to the user, providing a menu-based approach to utilization of features.

While the most basic element of the search engine interface (a search box into which users enter their queries) remained very much the same for most of search

engine history, that has also changed with the proliferation of “mobile” devices (smartphones, tablets, and wearable computers). Voice input has become not only possible, but the *preferred* interface for an increasing number of users.

The Portal Dilemma

From the early days of search engines, search engine providers have wrestled with the decision as to whether to make their home page one that focuses almost exclusively on “search” or one that provides a variety of added services, such as news and weather; the latter approach often referred to as a “portal.” From its beginning, before it was even a “search engine” and was just a directory, Yahoo! preferred the portal approach. AltaVista, a leading search engine in the 1990s, went back and forth between the two extremes, a situation that may have contributed to its demise. Google was, from the beginning, almost purely a “search engine,” and the simplicity of its interface was undoubtedly one factor in its rapid rise in popularity. Search services may “cover their bets,” however, by providing alternatives. For example, Yahoo! has provided a Google-like option at search.yahoo.com and Google at one point provided a “portal” version interface (iGoogle).

Searching Options Typically Provided

Search engines may provide a range of user accessible options that permit the user to modify their search queries in ways that can improve both the precision and the recall of their search results. Which specific options are provided varies from engine to engine. The most notable options include Boolean operations, phrase searching, language specification, and specifying that only those pages are retrieved for which the search term appears in a particular part (field) of the record such as the title or URL. Since engines usually cover other document types beyond just pages written in hypertext markup language (HTML), with some engines, users can also narrow their search to a specific file format (Web pages, Adobe Acrobat files, Excel files, etc.). Engines also provide an option to filter “adult content” material.

Up until the early 2010s, most search engines provided two ways for a user to take advantage of these options, syntax applied to search terms or an advanced search page. “Syntax” includes such things as explicitly including Boolean operators, such as “OR” in a search query and inserting a prefix in front of a search term. An example of the latter would be entering *intitle:malaria* in a search statement to specify that only items where the word *malaria* appears in the title should be retrieved.

Boolean logic

In the context of Web searching, “Boolean logic” refers to the process of identifying those items found in the

database that contain a particular combination of search terms. It is used to indicate that a particular group of terms must all be present (the Boolean “AND”), that any of a particular group of terms is acceptable (the Boolean “OR”), or that if a particular term is present, the item is rejected (the Boolean “NOT”). (See the entry, Boolean Algebras [*ELIS Classic*], p. xxx.)

Engines may provide two different ways to qualify a query with Boolean operations:^[1] the option of applying a syntax directly to what is entered in the search box and^[2] menu options on an advanced search page. Using the menus can be thought of as “simplified Boolean” and, depending upon the structure of the advanced search page, may or may not provide the precision achievable by the use of syntax in the main search box. (For example, the ability to apply “OR”s to more than one of the concepts included in the query may be done in the main search box but may not be allowed for on the advanced search page.)

The exact syntax used varies with the search engine. All major engines currently automatically apply an “AND” between your terms, so when the following is entered, *prague economics tourism*, what will be retrieved is what more traditionally would have been expressed as *prague AND economics AND tourism*.

Very precise search requirements can be expressed using combinations of the operators along with parentheses to indicate the order of operations. For example, (grain OR corn OR wheat) (*production OR harvest*) *oklahoma 1997*.

At various times, search engines have allowed the use of symbols (+, &, −, etc.) instead of words (AND, OR, NOT), and indeed, for the “NOT,” search engines typically suggest the use of a minus sign in front of the term. Some search engines require the use of parentheses around “nested” (OR’ed) terms, and some do not.

For details on Boolean syntax for any search engine, the help pages for that engine should be consulted. There are also websites that summarize the syntax (and other features) for all major engines.

The alternative to using syntax to apply Boolean is the use of menus on an advanced search page. There, for example, you may find a pull-down menu, where, if you choose the “all the words” option, you are requesting the Boolean AND. If you choose the “any of the words” option from such a menu, you are specifying an OR. There is usually also a box for excluding terms (“NOT”).

Phrase searching

Phrase searching is an option that is available in virtually every search engine, and almost always uses the same syntax, the use of quotation marks around the phrase. For example, searching on “*Red River*” (with the quotation marks) will assure that you get only those pages that contain the word “red” immediately in front of the word “river.” Of all search engine techniques, this is widely

regarded as one of the most useful and easiest for achieving higher precision in a Web search. It is also useful for such things as identifying quotations and identifying plagiarism.

Title searching

Title searching, that is, limiting your retrieval to only those items (pages) that have a particular term or combination of terms in their title, is one example of “field searching,” as referred to earlier. It is also another example of a technique that can yield very high precision in a search. Some search engines use the “intitle:” prefix and/or the “allintitle:” prefix for the syntax for title searching. (“allintitle:” allows specifying that more than one term be included in the title, not necessarily in any particular order.)

URL, site, and domain searching

A search engine may index Web pages (and other document types) by both the overall URL and the segments of the URL. This facilitates the finding of any document that comes from a particular domain or part of a domain (also a specific site or part of a site). Doing a search in which results are limited to a specific site allows one, in effect, to perform a search of that site. Even for sites that have a “site search” box on their home page, more complete results can often be found by using this technique than by using the site’s own search feature. “inurl:,” “allinurl:,” and “site:” are the prefixes commonly used.

The term “domain searching” is sometimes used to refer to the process mentioned earlier, and the use of the term “domain” points out that this approach can be used to limit retrieval to sites having a particular top-level domain, such as gov, edu, uk, ca, or fr. This could be used, for example, to identify only Canadian sites that mention tariffs or to only get educational sites that mention biodiversity.

Language searching

A search engine may allow limiting retrieval to pages written in a given language with perhaps the 40 or so most common languages specifiable. Though some engines have provided a prefix option for searching for languages, more typically one would go to the engine’s advanced search page to narrow to a language.

Date searching

Searching by the date of Web pages is an obviously desirable option, and most major engines provide such an option. Unfortunately, because of the lack of clear or reliable information on a page regarding when the page itself was initially created, the date on which the content of the

page was created, or even when the content on the page was significantly modified, it is often impossible for a search engine to assign a truly “reliable” date to a Web page. As a “work-around,” engines may take the date when the page was last modified or may assign a date based on when the page was last crawled by the engine. For searching Web pages, users should be aware of this approximation and its effect on precision when using the date searching option that is offered by most search engines (usually on their advanced search page). (On the other hand, for some of the other databases an engine may provide, such as news, the date searching may be very precise.)

Searching by file type

For most of the 1990s, most search engines only indexed and allowed searching of regular HTML pages. In the crawling process (or for submitted pages) when the engine’s indexing program encountered a link that led to another type of document, such as an Adobe Acrobat (pdf), or Excel (xls) file, the link was ignored. Starting with Adobe Acrobat files, other file types were fairly rapidly added to the corpus of “indexable” pages. This not only increased the breadth of resources available to the searcher but also provided the capability for the searcher to limit retrieval by type of file. Limiting to Adobe Acrobat files provides documents more suited to printing. Narrowing to PowerPoint files can provide convenient summaries of a topic. Limiting to Excel files can often enable a greater focus on statistics.

Natural language queries

In the early days of search engines, users could (and often did) enter “natural language” queries, such as *What is the capital of Bulgaria?* Engines would typically ignore the smaller, more common words and simply apply the Boolean “AND” to the remaining words. This often did provide users with an acceptable answer. At present, search services are extensively applying Natural Language Processing (NLP) both to the interpretation of the user’s query and to the analysis of the documents being searched, consequently making natural language queries much more effective and efficient. This became particularly important in light of the greatly increased availability and accessibility of search engines as “apps” on smartphones and tablets, NLP is also central to the utility and effectiveness of the voice input technologies for these devices, for example for Apple’s Siri, Google’s “Google Now,” and Microsoft’s Cortana. The importance of search engines’ NLP and voice input technologies likewise applies to smart home devices such as Amazon’s Alexa and Google’s Google Home.

Search Results Pages

As well as providing enhanced searching capabilities, search engines also enhance the content of results pages, beyond presenting just a listing of the Web page results that match the user's query. At the same time, they search their Web database, they may automatically search the other databases they have, such as news, images, and video, and on search pages may automatically provide links to the matching items from those additional databases. Some search engines may search additional "reference" resources, such as dictionaries, encyclopedias, and maps, and likewise display matching content from those sources and may also provide, "on the fly", a consolidated collection of facts on certain search topics such as places, people, companies, etc.

As well as displaying such supplemental content on results pages, search engines may also provide suggestions for ways in which the user might further qualify search criteria. This is done by suggesting related, narrower, or broader topics. Some engines also provide links to narrow the search by file type, language, or other criteria.

Specific options may also be offered on results pages for each individual retrieved item. Some engines keep a copy of each page they have indexed and provide a link to that "cached" page. This is particularly useful if, in the time since the page was indexed, the page was removed, is not available because of a server problem, or has changed in a way such that the term the user searched for is no longer on the page.

With records for pages that are not in the language of the search engine interface, there may be an option to translate the record (e.g., if the user is using an English language version of Google and a page is in French or if the user is using the French version and the page is in English). Click on the "translate" link to receive a machine translation of the page. As with other machine translations, what you get may not be a "good" translation, but it may be an "adequate" translation, adequate in that it will give you a good idea of what the page is talking about.

One feature offered on search results pages by all of the major engines is a spell-checker. If you misspelled a word, or the search engine thinks you might have, it graciously asks something like "Did you mean?" and gives you a likely alternative. If it was indeed a mistake, just click on the suggested alternative to correct the problem.

In many searches, search results pages will display links labeled as "ads," "Sponsor Results," "Sponsored Links," etc.—these are ads for websites and are there because a company or other organization has paid to have the ad appear on the search engine's results pages. Searchers should remain aware that it is the presence of these ads that makes the existence of search engines possible.

The Search Engine Leaders in the Second Decade of the Twenty-First Century

Popularity of various search engines can change fairly quickly. In the early and mid-1990s, a list of the most popular engines included, among others, AltaVista, HotBot, Excite, InfoSeek, and Lycos (Yahoo! was still primarily a directory, and though it had a search engine function, for that function it made use of, at various times, AltaVista's and Google's databases).

By the late-2010s, for the U.S. search marketplace, the search engine leaders were Google, Bing, and Yahoo! (in that order). Those three search engines represented 96% of all U.S. (desktop) searches.^[2] (Brief profiles of the engines just mentioned are given in the following text.) Outside the United States, in terms of market size and reputation, the leaders are Baidu (China) and Yandex (Russia).

Google

Google, which emerged as a company in 1998, grew very rapidly; its growth attributed largely to the simplicity of its interface, the lack of advertisements on the home page, and the quality of its relevance ranking (that fact significantly affected by Google's patented PageRank program).^[3] Google rather quickly went beyond "search" and began providing additional features and content, some of the enhancements emerging from within the Google organization and some (such as its e-mail service, Gmail) being patterned after such services already offered by its competitors. By the late 2000s, Google claimed more of the search market than all of its competitors combined and was offering a broad range of search services and a number of services not directly related to search.

For its Web search offerings, Google provides all of the typical search options (Boolean, field searching, etc.) plus some unique searching features, the latter including numeric range searching (e.g., *china history 1850..1890*). As well as the searching of Web pages, Google also offers searches of databases of images, maps, news, shopping, books (Google Books), journal articles (Google Scholar), etc. Some of these search offerings are very similar to corresponding services offered by Google's competitors, and some, such as "Google Books," were original and regarded by many as "groundbreaking." (Google Books is a major book digitalization project, in cooperation with major publishers and libraries.) The search features provided with each of these databases are typically tailored to the specific nature of that kind of content.

Many of Google's Web search features are features that were already found on other search engines, but for which Google provided significant enhancements. One example is Google Translate. Many search engines have provided a translation option that allows retrieved items from a number of non-English languages to be translated, using programs such as SYSTRAN's Babelfish. In 2007, Google

enhanced its own translation feature by allowing the user not just to translate a specific result, but to input a search in the user's own language, then have Google automatically translate the search terms, perform the search, and then deliver results in both languages. Translations are done using Google's own statistical translation technology. Google Translate also epitomizes another Google characteristic, rapid changeability. By 2015, Google Translate features had been pared down and though still regarded by many as the best translation tool on the Web, the direct integration of search with translation had been greatly diminished.

As it grew, Google rather rapidly redefined itself to be much more than a "search engine," adding services that went beyond "search" and even beyond usual website content. Some services had a direct relationship to "search," such as Google News Alerts, Google's financial portal ("Google Finance"), and Google's own Web browser ("Chrome"). Some of the services Google began to offer included types of things that already existed as "portal" features in other search services. These offerings included Gmail (a Web-based e-mail service), Google Earth (imagery and related geospatial content for the entire Earth, as well as the Moon and the sky), and Google Calendar. Google Drive (formerly Google Docs) offers a collaborative spreadsheet, word processor, presentations, form generator, drawing programs and "cloud" storage.

Bing

Microsoft has made several attempts since the mid-1990s to produce a Web search engine that is competitive with Google and Yahoo!. The attempts have gone by a variety of names, including Microsoft Search, MSN Search, Windows Live, Live Search, and, most recently, Bing. Search features have varied considerably and have at times been less robust than those of its competitors. Live Search presented some innovative features such as a design that allowed continuous scrolling through search results, but it, like some other features in the MSN Search products, was short lived. The 2008 version provided the typical Boolean and field searching options, plus some additional options such as "prefer:" by which the user could adjust the ranking weight for search terms and "feed:" and "hasfeed:" that identify websites that contain RSS links on the user's chosen topic.

In 2009, MSN further enhanced its engine and renamed it as "Bing." Bing has a different look and feel than the older versions, with a main page that has the now-usual minimalist search engine interface but with a large, attractive photographic background image. Bing enhances its search results with useful "facts," gathered from selected websites. Regarding search features, Bing search features are also somewhat minimalist, with no advanced search

page and very few filters. However, Bing does maintain a large number of prefix search options.

In addition to the search for Web pages, Bing also offers searches for images, video, news, and maps.

Yahoo!

Yahoo! was among the earliest websites that had the purpose of leading users to a specific content on the Web. In the beginning, Yahoo! was exclusively a "Web directory," a categorized list of selected websites. By 2000, however, it had begun a transformation to a portal site, having, in addition to the directory, over three dozen links to news, services, and other resources provided by Yahoo! and its affiliates, including pages for shopping, auctions, phone numbers, and a calendar. From its earliest days, the Yahoo! home page contained a search box, but results for that search came from a search of the directory, and later a search of Web databases from other search providers.

Yahoo!'s directory function became less and less central, and in 2004 Yahoo! created its own database of Web pages. Though emphasis on "search" continued to increase and the emphasis on the directory declined significantly, Yahoo!'s main image continued to be that of a portal, with the emphasis on the wide range of other services provided by Yahoo! and its partners, including Yahoo!'s highly popular e-mail service and its sections on autos, finance, games, groups, health, job listings, maps, real estate, travel, and over 20 other extensive content areas.

As of mid-2010, Yahoo! no longer provides a Web search technology or a Web database of its own. Yahoo!'s Web, image, and video searches were subsequently "powered by" at first by Bing. More recently, Yahoo's search technology, databases, and ads have been powered by combinations of Google, Bing, and Yahoo!'s own resources.

In addition to Web search, Yahoo! offers searching of the following databases: news, video, maps, businesses, shopping, sports, and more.

Non-U.S. general search engines

At various points, a number of other search engines have appeared in various countries. Two in particular have become successful in terms of international attention, extensive usage, and longevity: Baidu and Yandex. Baidu, from the People's Republic of China, was incorporated in 2000 and is used almost exclusively within China. It provides Web, images, and video searches. It may actually be best known because throughout its history, it has been the subject of widespread and extensive reports of government censorship. Yandex, from the Russian Federation, also first appeared in 2000. It provides searches for Web pages, images, video, and maps and also offers e-mail and

translation services. Interfaces are available in Russian, English, and Indonesian.

Specialty Search Engines

Over the years, a variety of search engines have appeared that could be classified as “specialty” search engines. Among these, there have been attempts to create search engines that focus on a particular topic or geographic location. In most cases, an examination of these showed that what was provided was more of a “directory” of selected sites than a broad ranging crawler-based search of Web pages for the specific topic or locality. On the other hand, there have been many successful attempts to produce search engines that provide searching for a particular format or type of document, such as images, video, blogs, and forums.

News

Searching of news databases is available from all of the general Web search engines. There are numerous other websites that specialize in searching news content. Each of these has varying degrees of searchability, and from the research perspective, it is important to note that the coverage can vary significantly, especially in regard to the number of news sources included, the time span for the content of the database, and the languages covered. Among the better-known news search engines are NewsNow, Silobreaker, and News Explorer.

Images

The most commonly encountered image search engines are those that are included within the general Web search engines, including Google, Yahoo!, and Bing. As well as subject searching, most of these engines allow for Boolean, and narrowing by size, coloration, site, and adult-content filtering. On Google’s advanced image search page, you can also narrow to photos that appear to contain faces. Flickr (flickr.com), an image-sharing website, has also gained extensive popularity as an image search engine. The extensive tagging of photos by Flickr users makes millions of images searchable. Picsearch provides an extensive collection of images from the Web and, in addition to the search criteria mentioned, also allows narrowing to animated images. There are also image search engines such as Corbis, Fotosearch, and Stock. XCHNG which enable users (for a fee) to use photos from commercial photographers and photo archives.

Image searching technology has made major advances since 2010. Earlier, images were indexed for searching almost entirely based on text found near the image (captions, other text near the image, file names, etc.) Since then, the major search engines and other organizations and researchers have utilized technologies such as NLP,

entity identification, and machine learning to be able to identify specific people, places, things, and a very wide range of other characteristics of an image. Once these “entities” and other characteristics are identified, all of them can be used as search terms or selectable categories, allowing image search engines to accomplish far more precise and complete results than in earlier years.

Video

As with image searching, searching for video is available from major search engines, including Google, Yahoo!, and Bing. Extensive searching of videos produced by individuals, as well as commercial video, is available from YouTube, the leading video-sharing site. Depending upon the search engine, options are provided for searching by Boolean, language, duration, domain/site/source, format, popularity, aspect ratio, and resolution, plus filtering for adult-content. Some video search engines specialize in video from TV, including news programs and interviews. These include TV News Archive (from Internet Archive, archive.org) and TVEyes (fee based).

Forums

Content found in forums (discussion groups, groups, newsgroups, etc.) can be utilized for a number of applications, ranging from hobbies to tracking terrorist activities, and there are search engines that specialize in finding this category of document. Though at one point there were multiple engines specifically for searching forums, by 2017 the only remaining one that was well-known was BoardReader. (There are a number of other places where groups can be searched, such as Google, Yahoo!, and Delphi Forums, but those sites focus on searching only the content that is hosted on their own websites.)

Other specialty search engines

There are still other categories of specialty search engines, including those for searching podcasts (e.g., podcastdirectory.com), and for searching for information on people (e.g., pipl, Infobel, Intelius, PeopleFinders).

Visualization Engines

Visualization search engines are websites (or programs) that provide a very different “look” (literally) at search results. Instead of the traditional linear, textual list of retrieved items, results are shown on a map that spatially shows conceptual connections. Most visualization engines have not utilized a database of their own but have borrowed one from other engines (Google, Yahoo!) or other sites such as Amazon.com. Visualization has been, and continues to be, an area of extensive research, and there have been several sites for demonstrating various

visualization approaches. The type of conceptual and visual mapping done by these sites can be especially useful for quickly exploring the concept possibilities, directions, and terminology for a particular search. It presents a “connect the dots” approach, enabling understanding relationships among the concepts found in various search results. Some such engines have appeared but are now gone, particularly Kartoo and Grokker. Still extant are TouchGraph and Quintura, the latter as a downloadable program. Visualization technologies are used within a number of websites, including news search engines such as SiloBreaker and EMM NewsExplorer.

Metasearch Engines

The term “metasearch engine” (or “metasearch site”) usually refers to websites that search multiple search engines in a single search. The degree of overlap (or lack thereof) between search engine results is something that professional searchers frequently consider and allow for as they search, and searching more than one engine is a widely encouraged technique. Metasearch engines have been available since the 1990s and include sites such as Dogpile, and Clusty. Each of these may provide additional benefits beyond just a compilation of results from more than one engine, for example, the “clustering” (categorization) of retrieved results, a feature that may not be provided by the target engines themselves. However, users should be aware of several shortcomings that may be encountered with these tools: 1) most of the current metasearch engines have not included results the largest major engines, particularly Google and Yahoo!, which tend to block queries from metasearch engines; 2) metasearch engines typically only return the first 10–20 results from any of the “target” engines; 3) metasearch engine results

often discard useful and search-relevant information found on the actual search engine’s results pages; 4) metasearch sites, even if they do cover the largest engines, may be required by those engines to show paid listings first; and 5) metasearch engines typically do not allow application of many of the search features available in the target engines themselves.

CONCLUSION

Web search engines have evolved extensively since they were first introduced in the early 1990s. The basic concept has remained the same, but the quality of results, the size of their databases, and the types of material that they have included increased dramatically. The total number of general Web search engines “in the race” has decreased and at present is dominated by one service, Google. What has evolved even more dramatically is the “mission” of search services, which, particularly in the case of Google, has gone far beyond “search.” With advancing technologies, increasing interactiveness of the Web, and a more and more Internet-centered society, users can expect continued, fast-paced innovation.

Self-Publishing Online

Caryn Wesner-Early

ASRC Aerospace & Defense, US Patent & Trademark Office, Alexandria, Virginia, USA

Abstract

Over the past 10 years, self-publishing on the Internet has taken off and presents problems and opportunities for both authors and libraries. Tasks involved in self-publishing are reviewed, and current issues and future trends are discussed.

INTRODUCTION

Until the advent of the Internet, self-publishing (also known as vanity or subsidy publishing) had very little impact on the library world. Without mechanisms for marketing, reviews, and library distribution, vanity press publications were invisible to librarians and library users. Since vanity publishers required up-front payment by authors, their publications carried a stigma, and the widespread belief was that if an author could not persuade a reputable publisher to buy a book, it was not up to library standards.

In the 1980s, however, the development of desktop publishing made it possible for authors to print their works without necessarily having to go through a publisher. These efforts were often amateurish, and the available printer speeds kept production down. There were still few ways to publicize and market such a book, and the products were unattractive. Authors were beginning, though, to realize the power of self-publishing.

Since the mid-1990s, the Internet, and especially the World Wide Web, has become the medium of choice for self-publishers. Some self-publishing is informal in the extreme; according to many, if a person mounts a web page of any kind, they have self-published on the Internet.^[1] Many web users post in message boards or newsgroups, contribute articles to e-newsletters, write fan fiction based on literary or television characters, or maintain “blogs” (weblogs of interesting sites), which may also be considered online self-publishing. For the purposes of this entry, however, self-publishing online will be defined somewhat more formally.

DEFINITION OF SELF-PUBLISHING ONLINE

The *Oxford Companion to the Book* defines an e-book as an electronic book (variously: e-book, eBook, e-Book, ebook, digital book, or even e-edition) is a book-length publication in digital form, consisting of text, images, or both, readable on computers or other electronic devices.^[2]

Electronic publishing usually takes one of three forms: commercial, subsidy (vanity), or self-publishing.^[3] Subsidy e-publishers operate as the traditional vanity press, publishing an author’s work for a fee. When self-publishing, the author is responsible for all aspects of the book. Rather than a clear delineation between vanity publishing and self-publishing, there is now a continuum, from a flat fee for all services, as in traditional vanity publishing, through the author investing very little out of pocket and doing all work himself or herself. In between are myriad systems whereby authors can decide which publishing tasks to do and which to outsource to publishing services.

For the purpose of this entry, then “Self-Publishing Online” will be defined as “Electronic content that is transmitted and/or displayed on a device or system to be read by the viewer similar in experience to reading a book, with technical publication tasks performed or contracted out by the author.”

TECHNOLOGIES FOR E-PUBLISHING

While online publishing can be as simple as a HTML web page, that is not the ideal format for many publications. There are a number of e-book formats vying for attention, and it is too early to tell which will become a standard. Many people believed that e-books would not become popular until they could pass the “Four B” test: ability to be carried comfortably to the beach, the bathroom, the bus, and the bedroom.^[4] To this end, several portable formats are in use, many for the cell phones and tablets people already use. Some devices use unique display software, so that an e-book cannot be published in all formats simultaneously. There are also dedicated e-book readers that are often called e-books themselves; although with the rise of smartphones and tablets, they are already becoming rarer.^[5] They do nothing but read e-books (rather than including web-surfing capabilities or printing) and include the Amazon Kindle (original version).

Industry organizations are at work trying to frame standards that will allow interoperability among the devices

and their software. The International Digital Publishing Forum (formerly The Open eBook Forum) released version 3.0.1 of the EPUB® specification, “a distribution and interchange format standard for digital publications and documents,” in October 2011.^[6] It and Adobe Acrobat are the most widely used open standards for electronic publishing. EPUB can be read on many platforms, including the Sony Reader and the Barnes & Noble Nook, but in order to be used on a Kindle, files must still be converted to their proprietary format.^[7] Another popular e-book platform, iBooks (for use on iPad and related readers), also has its own format.^[8]

Still, eventually standards may enable a manufacturer to produce a device that will read a number of formats. There is historical precedent for this: In 1947, an industry-wide agreement allowed manufacturers of phonographs to include both 33 and 45 rpm speeds on their turntables, making possible the huge popularity of phonograph records in the 1950s and 1960s.^[9]

A variation on electronic publishing is print on demand (POD), which allows books to be stored electronically but printed in book form when a reader wants one. This service is offered by many electronic publishers and favored by some authors. Like pure electronic publication, POD does not require large sales volume in order to be profitable. There is also interest in using it to bring back out-of-print titles for which rights have reverted to the author.^[10] POD can be offered as a choice along with electronic means of publication for e-books.^[11]

TECHNICAL PUBLICATION TASKS

There is a wide variety of tasks that have been traditionally performed by publishers but are now being done by authors who self-publish. Some of these tasks are the same as they have always been (e.g., editing and design of cover art), while some are peculiar to e-publishing (such as converting files to e-book formats and setting up a website for the publication). The more of these tasks that the author elects to perform, the more control the author will have, but the more labor-intensive the project will be. Many authors find that a hybrid approach, contracting out some tasks and performing others, works well. Tasks that must be performed, either by the author or by a publisher or publishing service, include^[12]

- *Editing:* Most authors have trouble changing their work, so this task is often outsourced to a professional editor.
- *Layout and design:* For most text-only books, this can be done using a computer, by either the author or a professional design service. If the book is very visual, however (e.g., an art book), this may be done largely by the author.

- *File conversion:* It is necessary to convert the file format to forms that are readable by the various e-book devices discussed earlier.
- *Web presence:* In order for something to be published online, it must have an online presence; in most cases, a web page. A web host must be found and contracted for, a URL must be decided on and purchased, a website must be designed, and then the site must be maintained to make sure it does not go out of date. Even if the book is published in a portable e-book reader format, there must still be a web page from which purchasers can download it.
- *Cover illustration:* Many authors new to online publishing do not realize that a cover is still important, even for an electronic publication. The web is a visual medium, and customers are likely to pay more attention to a well-designed cover than to a plain title listing.^[13]
- *International Standard Book Number (ISBN):* If the author wishes to list the e-book in *Books in Print*, *Forthcoming Books*, and other such directories, or to distribute it through online bookstores, an ISBN is necessary. ISBNs can be bought individually, or in blocks of ten or 100. A different ISBN is needed for each format, so if the author expects to create several different versions of the book (for instance, more than one electronic format), purchasing ten or more would be most economical.^[14]
- *Publicity, marketing, and listing with online bookstores:* A book must be promoted to its prospective audience, or there will be no customers. Websites that attract the people who would be interested in the book must be contacted with offers of a free review copy or an entry for the site.^[15] Reviews, interviews, radio or television appearances, and other publicity events must be planned. If the author wishes to distribute the work through online bookstores, listing must be arranged with the bookstores.

A new method of publicity and marketing is being pioneered by author Seth Godin, among others. Instead of writing the book and then marketing it, Godin builds what he calls “tribes” via his website and blog, then funds it with a Kickstarter campaign.^[16] This has the advantage of investing his readers in the book before publication, so that they already know what they’re going to get when they buy it, and are eager to read it. This requires intensive effort on the part of the author, though, to build the emotional connection with readers that will make them want to be a part of the enterprise.

- *Sales and order processing:* There are a number of models for pricing and collecting payment. If payment is to be received via credit cards, a merchant account must be set up, either directly through a bank or indirectly through merchant account providers.^[17] Once

payment is arranged, one method of delivering e-books is to load a few entries onto the web for customers to read for free, then charge for the rest. The balance of the book can also be on the web, but under password protection; the file can be transferred to the buyer's computer/reader; or it can be downloaded to disk or printed.^[18] Some sites that host self-published works will also keep track of the number of times an item is downloaded and pay the author a certain amount of money per download. Another part of the transaction can be the collection of information from customers so that future e-books can be marketed to them. An e-mail address is particularly important for reaching customers with news.^[19]

- *Copyright:* It is no secret that copyright of materials on the Internet is a thorny problem. Technically, anything published, whether in print or on the Internet, is considered copyrighted as of publication.^[20] However, enforcing a copyright is often more difficult and is the province of digital rights management (DRM). Usually, people speak of "A" copyright, but it is legally "generally considered to be a bundle of legal rights that accompany the physical creative product... [and] which can be assigned or retained in whole or in part."^[21] Rights under copyright include film rights, serial rights, foreign publishing rights, and more.
- *Security and DRM:* Since it is extremely easy for anyone to download an item from the Internet, and to plagiarize it or quote it out of context,^[22] DRM is an important consideration for electronic publications. DRM has been defined as "effective rights management and protection of digital content across the entire value chain - from creators [and] distributors to customers."^[23] Its purpose is to enforce copyright while maintaining as much interoperability as possible among different e-publishing systems. Opinions differ as to how much of a problem e-book piracy is. On the one hand, there are websites that deal in pirated e-books^[24] and may be losing publishers and authors' untold amounts of money. On the other hand, DRM may not actually be preventing piracy, instead causing a loss of goodwill on the part of the customers.^[25] Publisher's Weekly discovered that it is actually a sales-killer, harming sales "at any price point."^[26] Whether or not to use it is one of the decisions which an author must make.
- *Print on Demand fulfillment, if desired:* The author may not wish to provide access to the e-book via POD, but if it is desired, a method for high-speed printing, as well as shipping the physical item, must be considered.
- *Metadata, if desired:* In early 2000, Guidelines for ONline Information eXchange (ONIX) were published by the Association of American Publishers establishing a set of over 200 elements that will describe every aspect of a book in detail. (The current edition of these

guidelines is ONIX 3.0, published in April 2009)^[27] These elements, tagged for the Internet using eXtensible Markup Language (XML), are searchable online, providing more ways of discovering or finding e-books. Many of the elements are the kinds of information often found on the book jacket of a printed book, such as an author biography or an excerpt, as well as "kernel" data such as author, title, and ISBN. This can increase sales of an e-book as much as eight times those of an e-book without this metadata.^[28]

SELF-PUBLISHING USING A PUBLISHER OR E-PUBLISHING SERVICE

Electronic self-publishing can be done in a way that is close to the old vanity press model. The author can negotiate a contract, pay a fee, and submit a manuscript for publication. However, instead of clear delineation between self-publishing and vanity publishing, it can be seen that there is a continuum from total self-publishing, through contracting some or all of the services above, to actual vanity or subsidy publishing. E-publishing services can do any or all of the tasks listed above for set fees.^[29] The Internet has made the demarcation between publishers and publishing services, like many others, more vague. Publishers may even, in the words of Barnes and Noble's Steve Riggio, "become ... unnecessary [middlemen] in the distribution of electronic content..."^[30] An alternative to this is that publishers may "change from being producers of commodities (books) to being creators of a suite of content-based services"^[31]—in other words, publishing services.

A new profession has arisen to help with any or all of the tasks mentioned earlier but in a more personal way than a traditional publisher might. It goes by a variety of titles, including book shepherd, book coach, publishing strategist,^[32] book consultant, book coach, book doctor, book midwife, book birther, and more.^[33] A book shepherd can help with everything from determining the potential audience and creating platforms, through connecting the author with printers, agents, and other team members, to making sure everything works smoothly throughout the project.^[34] Like the role of the author itself, the role of the book shepherd is fluid, depending on what the author needs and what kind of budget is available.

PROS AND CONS OF SELF-PUBLISHING ONLINE

There are many advantages to self-publishing online, as opposed to more traditional publishing methods.

One of the most obvious reasons is to make more money per copy. Rather than the 6%–10% of the sale price in royalties that traditional printed books bring in, self-

published books can pay 35%,^[35] and with far less overhead for print costs and the like, electronically self-published books could pay even more. The profit margin on electronic publishing is much higher than on traditional publishing; low costs for manufacturing and distribution mean that it may take only a few hundred books to make a profit.^[36] The advantages of speed and full author control are also appealing.^[37]

Noncommercial works, such as “novella”-length fiction, can be published electronically with more success than by traditional means. One of the earliest self-e-publishing projects, Stephen King’s “The Plant,” was of this length. Publication of that story was halted before it was finished because the honor-system pay arrangement did not work, with fewer than half of the downloads paid for.^[38] Newer funding processes are being worked out now, many using social media or crowdfunding sites such as Kickstarter. Seth Godin may be one of the best-known self-publishers and has used the Kickstarter model, in which the author builds interest and gathers seed money before publishing the work.^[39]

“Niche” publications, which appeal to a sufficiently narrow audience that sales are not expected to be large, can also benefit from this model, as can crossover books which span more than one genre (e.g., such as a science-fiction mystery).^[40]

Authors whose works have previously been published traditionally but have gone out of print are using online self-publishing to bring back out-of-print books. When a traditional book goes out of print, rights revert to the author, and authors whose books have become popular several years after publication (because of a movie, for instance) find that they can make new profit by publishing them on their own, on the Internet.^[41,42] Some authors may prefer to self-publish online so that they never lose their copyright at all.^[43] Authors may also be able to serialize long works, as was frequently done through magazines in the nineteenth and twentieth centuries.^[44]

Electronic publishing also offers quick, easy updating of information that changes frequently, as well as interactivity and the convenience of hyperlinks to other parts of the same publication or others on the web.^[45]

There are, however, many disadvantages to this publishing model as well. One is the lack of standards; now that anyone can publish, there will inevitably be many substandard publications. Walt Crawford, of the Research Libraries Group, quotes Sturgeon’s Law: “90 percent of everything is crap.” It is possible that, without standards or gatekeepers, the bad books will crowd out the good ones.^[46] Also, good publications may have no credibility because they have not been subjected to the editorial and critical review that has been the norm.^[47]

Production values are often amateurish, since authors are not accustomed to performing the technical tasks of publishing an e-book. Similar problems arise with promotion, marketing, and distribution.^[48] In fact,

MightyWords.com, a company that worked with authors to publish books electronically, discontinued many of their self-publishing efforts because “As a company, we can’t do a perfect job promoting self-published titles. . . the authors didn’t do enough to participate in the process of marketing and promoting their titles themselves.”^[49] (In 2001, MightyWords closed down, citing insufficient demand for virtual content.^[50]) Unless a book is publicized and marketed, it can hardly be considered to have been published at all.

Copyright, as noted earlier, also presents unique challenges to electronic publications. DRM is becoming big business; according to the Dutch firm GfK, “only 10% of all eBooks on devices were actually paid for, with most of the digital books being pirated.”^[51] Since there is a widespread perception that anything on the Internet is free for the taking, anyone can change and/or repost electronically published material, and finding, proving, and prosecuting such misuse is, so far, very difficult.^[52] The lack of standards and interoperability of e-book devices, mentioned earlier, also contributes to the difficulty of reading and publishing electronically. Archiving of electronic content, with the related problem of the ability of the actual owner of the work (not the person or institution leasing it) to change content in e-books previously “bought,” presents very serious ethical considerations for both individuals and libraries.^[53]

IMPACT OF SELF-PUBLISHING ONLINE ON LIBRARIES AND LIBRARIANS

The impact of electronic publishing in general has been felt in libraries for some years now. Librarians are already dealing with problems of cataloging and bibliographic control, contracts for multiple users, and devices and formats. Adding virtual publications to library collections, monitoring use by library patrons, and deciding on which readers and software to invest in will occupy librarians for years to come. Electronic publishers can help librarians in this by making sure the metadata on their publications conforms to a standard such as ONIX, described earlier, or the Dublin Core (a separate metadata system being developed by librarians).^[54]

Libraries are now “buying” (actually, leasing) more and more e-books, as patrons with reading devices demand them.^[55] The problems of dealing with publisher limits on a number of loans and ridiculously high costs for libraries’ (as opposed to individuals’) downloads of e-books are well known in the library field.^[56] There are a number of distributors, such as OverDrive and Freading, but they can cause new problems, with different requirements for libraries and readers making the borrowing experience more complicated than it is with paper books.^[57] These are problems whether the e-books are self-published or not. Offering self-published books can bring additional concerns.

One of the big problems with offering self-published books, whether electronic or not, has been the difficulty of finding reviews, but with new sources of reviews available, this may not have as much influence as previously.^[58–60] Even such heavyweights as Kirkus Reviews and Publishers Weekly, through their programs Kirkus Discoveries and PW Select, have begun reviewing self-published works.^[61] Another problem has been that the large distributors (such as Overdrive) have not handled self-published books, but that is also starting to change. In May, 2014, Overdrive and Smashwords, one of the largest self-publishing platforms, made a deal to offer Smashwords books to libraries via Overdrive.^[62] Some of the walls are beginning to come down, and libraries will almost certainly be able to offer more and more self-published e-books in the future.

But checking self-published e-books out to patrons is not the only way libraries are interacting with them. Libraries may become centers for authors who wish to publish electronically. Mark Coker, owner of e-publishing platform Smashwords, has developed a series of seminars for libraries to use to help their own users become self-publishing authors,^[63] and has worked with libraries to organize contests for electronic authors,^[64] offering the prize of Smashwords' help in publishing their books. An exciting opportunity for librarians in online self-publishing is the ability for libraries to publish their own resources on the web. Many librarians already count web publishing as part of their jobs, as libraries publish their own unique bibliographies and other home-grown resources to the world via the web.^[65] Thus, items that have been relatively inaccessible to anyone outside the immediate library community can become accessible to a broad audience.

FUTURE TRENDS

As electronic self-publishers become more successful, traditional publishers are moving into this new area in order to preserve their leadership. For instance, Penguin Books purchased a self-publishing platform called Author Solutions in 2012,^[66] German publishing group Verlagsgruppe Georg von Holtzbrinck now owns self-publishing platform epubli,^[67] and Simon & Schuster has its own self-publishing platform, Archway Publishing.^[68] However, some data suggests that this may not be working for them: major publishers charge more per book than self-publishers, but tend to get lower reader reviews. They are also losing ground quickly, with major publishers selling almost the same number of units as self-publishers (based on Amazon sales of “top five” publishers' e-books).^[69] There are several areas in which electronically published books (whether self-published or put out by more traditional publishers) are expected to grow quickly. Quoting a Bowker report, Francine Fialkoff says that most self-

publishers polled “plan to bring fiction to market, followed by inspirational or spiritual works, books for children, and biographies.”^[70]

New technologies are also expected to have an effect on online publishing. Electronic ink is a new digital paper substitute. Display screens are already 30% lighter and thinner than LCDs, and the goal is to make them thin enough to be rolled or folded like paper.^[71] But even with current readers, a person can carry one book, the text of which can be changed or updated at will wirelessly.^[72] The ethical considerations alone of such an innovation are dizzying.

CONCLUSION

After a decade or so of very little growth, self-publishing on the web has exploded since the introduction of convenient readers and tablets like Kindle and Nook,^[73] which pass the “Four Bs”: ability to be carried comfortably to the beach, the bathroom, the bus, and the bedroom. People are reading more e-books, and a surprising number of them are self-published. This field is even more volatile than the Internet upon which it depends, and changes will be happening dynamically for the foreseeable future.

Semantic Interoperability

Marcia Lei Zeng

School of Library and Information Science, Kent State University, Kent, Ohio, U.S.A.

Lois Mai Chan

School of Library and Information Science, University of Kentucky, Lexington, Kentucky, U.S.A.

Abstract

This entry discusses the importance of semantic interoperability in the networked environment, introduces various approaches contributing to semantic interoperability, and summarizes different methodologies used in current projects that are focused on achieving semantic interoperability. It is intended to inform readers about the fundamentals and mechanisms that have been experimented with, or implemented, that strive to ensure and achieve semantic interoperability in the current networked environment.

INTRODUCTION

Semantic interoperability, which is defined as the ability of different agents, services, and applications to communicate (in the form of transfer, exchange, transformation, mediation, migration, integration, etc.) data, information, and knowledge—while ensuring accuracy and preserving the meaning of that same data, information, and knowledge—is central to the effective management, sharing, and retrieval of information in an open environment. Within the spectrum of different perspectives on interoperability, semantic interoperability lies at the heart of all matters. It deals with the language and vocabulary used in communication (human and machine) and facilitates information retrieval and resource sharing by users through whatever language or vocabulary they choose to use (often across language and cultural barriers). This entry is intended to inform readers about the fundamentals and mechanisms that have been experimented upon, or implemented, that strive to ensure and achieve semantic interoperability in the current networked environment.

Related standards such as the Resource Description Framework (RDF),^[1] RDF Schema,^[2] Web Ontology Language (OWL),^[3] and Simple Knowledge Organization Systems (SKOS),^[4] developed under the auspices of the World Wide Web Consortium (W3C), and the theoretical basis of semantics, are not discussed in detail here; these topics are covered in separate entries elsewhere.

SEMANTIC CONFLICTS AND AGREEMENTS

The ability to exchange services and data with and among components of large-scale distributed systems is contingent on agreements between requesters and providers. Those agreements may be based on e.g., message-passing protocols, procedure names, error codes, and argument

types. This means that these exchanges must make sense—that the requester and the provider have a common understanding of the meanings of the requested services and data.^[5] When multiple pieces of information are being exchanged, however, correct interpretation of some or all fractions of that information may be considered either partially or perfectly interoperable semantically.

We shall consider the example of the sequence “071210,” which can be literally transferred from one system to another; however, its meaning may be interpreted in any number of different ways. We might ask:

1. Is it a string or an integer?
2. If it is a string, does it represent a date, a phone number, an area code, or a hexadecimal number representing a color?
3. If it specifies a date, what date is it: a person’s birth date, a publication’s issuing date, or an archaeological site’s discovery date?
4. If it represents a date associated with a historical monument, what date is it indicating: the creation date, the restoration date, or the alteration date?
5. If “071210” represents a date in the twentieth century, which format does it represent: yy-mm-dd (i.e., 1907, December 10), mm-dd-yy (i.e., July 12, 1910), mm-yy-dd (i.e., July 1912, 10), or dd-mm-yy (i.e., 07 December, 1910)?
6. If information about *start-time* and *duration* is provided in a system, will the values be equal to the *earliest-date* and *latest-date* (derived by adding duration to the start-time) that are modeled on another system?
7. If “1912” is the value of a year in a system, how could this be mapped to the terms representing the same time period but from different perspectives? For example, in a Dublin Core (DC) record, this value associated with *dc.coverage* could be “Republic of

China 1st Year (民国元年),”^[6] or in a MACHine-Readable Cataloging (MARC) record, in field 260, it could appear as “min kuo 1 [1912].”

8. If the value of the year “1912” from one system is to be mapped to a value defined by another system, how should the non-one-to-one correlation be reconciled? For example, when applying the Library of Congress Subject Headings (LCSH) in subject-related fields in many metadata records, the closest match to “1912” might be a longer time period (e.g., “Nineteen Tens”), especially in the context of historical events, e.g., “Qing dynasty, 1644–1912” or “United States—History—1865–1921.”
9. If a system was designed to generate a second value from a value, e.g., “date < 1920,” which should result in the corresponding value “class = unclassified” (in terms of document release status), will another system be able to interpret the aggregated value?

Indeed, the number could represent almost any of millions of types of quantitative measure, and the strings could be mapped to constructed expressions in many different systems. Questions such as those above illustrate just some of the many possible *semantic conflicts*.

Interpretation of the meanings carried by the string depends strictly on the circumstances of transmission according to the *agreements* among systems. One study^[7] states that the goal of interoperability is to build coherent services for users from components that are technically different and managed by different organizations. This requires cooperative agreements at three levels:

- Technical agreements cover, among other things: formats, protocols, and security systems so that messages can be exchanged.
- Content agreements cover data and metadata and include semantic agreements on the interpretation of information.
- Organizational agreements cover group rules for access, preservation of collections and services, payment, authentication, and so on.

Semantic agreements require the involvement of people (users, designers, and developers) who associate semantics with data structure, data content, and data values. The impact could be at any of the implementation levels such as procedure names, type definitions and type hierarchies, screen layouts, and report formats (e.g., titles, column and row headings, dates, units of measures, sort order, or footnotes). These and many other types of semantic information might be *implicit* in application codes, in diagrams, and in the local “oral tradition.”^[5]

Experience has shown that interoperability through comprehensive standardization is hard to achieve.^[7] There is a need to maximize the amount of semantics that can be utilized and to make it increasingly *explicit*.^[8] Making

semantics explicit in metadata would allow people to detect mismatched assumptions and to create the required mappings to overcome them, despite the still extraordinary difficulties.^[5]

DIMENSIONS OF INTEROPERABILITY

There have been many attempts at defining the concept of *interoperability*. Stressing a result-oriented definition, *Understanding Metadata* states that “[i]nteroperability is the ability of multiple systems with different hardware and software platforms, data structures, and interfaces to exchange data with minimal loss of content and functionality.”^[9] Other groups emphasize a process-oriented definition: “Interoperability is the ability of two or more systems or components to exchange information and use the exchanged information without special effort on either system.”^[10] “Interoperability: The compatibility of two or more systems such that they can exchange information and data and can use the exchanged information and data without any special manipulation.”^[11]

It should be apparent that merely having the ability of two or more systems or components to exchange data does not ensure correct interpretation of an integer or string. Interoperability issues must be addressed not only at the syntactic and functional levels, but also at the semantic level.^[12] Without *syntactic interoperability*, data and information cannot be handled properly with regard to formats, encodings, properties, values, and data types; and therefore, they can neither be merged nor exchanged. Without *semantic interoperability*, the meaning of the language, terminology, and metadata values used cannot be negotiated or correctly understood.^[13] Varying degrees of semantic expressivity can be matched with different levels of interoperability: low at syntactic interoperability, medium at structural interoperability, and high/very high at semantic interoperability.^[14]

Ouksel and Sheth^[15] identify four types of heterogeneity which correspond to four types of potential interoperability issues:

- System: incompatibilities between hardware and operating systems.
- Syntactic: differences in encodings and representation.
- Structural: variances in data models, data structures, and schemas.
- Semantic: inconsistencies in terminology and meanings.

Obrst,^[14,16] on the other hand, intertwines six levels (object, component, application, system, enterprise, and community) of interoperability with three kinds of integration (syntactic, structural, and semantic). According to

Obrst, semantics is fundamentally interpretation within a particular context and from a particular point of view. Semantic interoperability/integration is fundamentally driven by the communication of coherent purpose.

Pollock and Hodgson^[17] consider data to be the foundation of all information sharing programs and believe that next-generation systems rest upon an expanded view of the dialectic of data—information. This view is illustrated in a pyramid in which the interface-level integration, method-level integration, and process-level integration all have developed on top of a foundation of data. With semantic interoperability, the expanded notion of data includes *semantics* and *context*, which thereby transforms data into information. This transition both broadens and deepens the foundation for all other integration approaches, blending semantic interoperability within various levels of interoperability:

1. Semantic interoperability of *data* enables data to maintain original meaning across multiple business contexts, data structures, and schema types.
2. Semantic interoperability of *process* enables specific business processes to be expressed in terms of another by: 1) inferring meaning from the process models and contextual metadata; and 2) applying it in a different process model elsewhere or outside the organization.
3. Semantic interoperability of *services/interface* enables a service to look up, bind, and meaningfully communicate with a new service.
4. Semantic interoperability of *applications* enables platform-independent interactions between heterogeneous software applications.
5. Semantic interoperability of *taxonomy* enables correct expression of all categories (including the definitions and relations with other categories) between different taxonomy systems.
6. Semantic interoperability of *policies and rules* enables businesses to protect valuable resources.
7. Semantic interoperability of *social networks* enables people in different communities of interest to network, make inferences, and discover meaningful connections.^[17]

In general, interoperability, no matter at what level, is concerned with the capability of different information systems to communicate with one another. This communication may take various forms such as the transfer, exchange, transformation, mediation, migration, or integration of information. Therefore, as stated at the outset, we may define semantic interoperability as the capacity for different agents, services, and applications to communicate data, information, and knowledge while ensuring accuracy and preserving the meaning of that data, information, and knowledge.

PERSPECTIVES ON THE CONSTITUENTS OF SEMANTIC INTEROPERABILITY

Semantic interoperability has been a topic discussed in information processing and exchange communities since long before the World Wide Web emerged. However, the issue has never been so critical or of such great concern among so many communities as today. Although the Web is an information resource with virtually unlimited potential, this potential is relatively untapped because it is difficult for machines to process and integrate this information meaningfully.^[18] Components that contribute to achieving semantic interoperability have been proposed by researchers from a number of diverse perspectives.

Semantic Interoperability in Different Processes

In a report entitled *Semantic Interoperability in Digital Library Systems* prepared by Patel, Koch, Doerr, and Tsinaraki at UKOLN, a research organization that is based at the University of Bath, U.K.,^[19] semantic interoperability is characterized by the capability of different information systems to communicate information consistent with the intended meaning of the encoded information (as it is intended by the creators or maintainers of the information system). It involves: 1) the processing of the shared information so that it is consistent with the intended meaning; and 2) the encoding of queries and presentation of information so that it conforms to the intended meaning regardless of the source of information.

Seligman and Rosenthal^[20] categorize information interoperability according to two principal types of processes. For information exchange, a provider responds to a request, and the information is transformed to suit the requester's needs. For information integration, in addition to being transformed, information from multiple sources is also correlated and fused. Integration requires that four levels be addressed: Level 1—Overcome geographic distribution and infrastructure heterogeneity; Level 2—Match semantically compatible attributes; Level 3—Mediate between diverse representations; Level 4—Merge instances from multiple sources. Information interoperability is required both in the information exchange and information transfer processes.

Obrst^[14] has suggested that semantic interoperability could be enabled through: 1) establishing base semantic representation via ontologies (class level) and their knowledge bases (instance level); 2) defining semantic mappings and transformations among ontologies; and 3) defining algorithms that can determine semantic similarity by employing their output in a semantic mapping facility that uses ontologies.

In many cases, mapping and integration are conducted on top of existing systems that might have been created without considering integration with other systems. Addressing semantic interoperability in different processes helps

to identify related problems and methodologies and then resolve those (and other) issues.

Semantic Interoperability at Different Levels

The UKOLN report on *Semantic Interoperability in Digital Library Systems* distinguishes three levels of information that are treated in a distinct manner to address semantic interoperability^[19]: 1) *data structures*, be they metadata, content data, collection management data, or service description data; 2) *categorical data*—data that refer to universals, such as classification, typologies, and general subjects; and 3) *factual data*—data that refer to particulars, such as people, items, or places. It might be expected that the treatment of data structures and factual data would achieve a high level of semantic agreements; however, this correlation is not guaranteed when dealing with categorical data. Whereas the local degree of standardization of categorical data may be very high, the global one may be poor.

Slightly different from the perspectives above is a differentiation based on *data structure*, *data content*, *data values*, and *data communication* in metadata practices. The most notable practice is in the cultural heritage community, which has developed a set of comprehensive standards and guidelines for describing cultural objects. The conceptual reference model (CRM) produced by the International Committee for Documentation (CIDOC) of the International Council of Museums (ICOM) provides definitions and a formal structure for describing the implicit and explicit concepts and relationships used in cultural heritage documentation. Semantic interoperability is defined as the capability of different information systems to communicate information that is consistent with intended meaning (see also the “Semantic Interoperability in Different Processes” section). More precisely, the intended meaning encompasses: 1) the data structure elements involved; 2) the terminology appearing as data; and 3) the identifiers used in the data for factual items such as places, people, objects, etc.^[21] In the museum and visual resources community, agreements have been reached on these constructs to ensure the creation of sharable and high-quality metadata. Categories for the Description of Works of Art (CDWA)^[22] defines a *data structure* which “enumerates a set of categories or metadata elements that can be used to create a structure for a fielded format in a database.”^[23] Cataloging Cultural Objects (CCO)^[23] is a *data content* standard that guides the choice of terms and defines the order, syntax, and form in which data values may be entered into a data structure. Examples of standards for *data values* in the form of controlled vocabularies include the Art and Architecture Thesaurus (AAT),^[24] the Thesaurus for Graphic Materials (TGM),^[25] the Union List of Artist Names (ULAN),^[26] and the Getty Thesaurus of Geographic Names (TGN).^[27] Data content and data

value standards must be used in conjunction with an agreed-upon data structure.

Chung and Moen’s two-dimensional approach for investigating issues of semantic interoperability in digital libraries^[28] is related to the two perspectives above. The *data-attribute* area defines the names, labels, semantics, and granularity of metadata elements and database fields. The *data-value* area addresses the data or information provided in an element or database field. In this approach, the deduction that the data-attribute dimension’s components are *semantics* and *content* was based on another discussion about metadata interoperability by the authors of this entry.^[29] In that paper, the *semantics* aspect is understood to constrain the attributes (metadata elements and their refinements and relationships) according to agreed-upon meanings. The *content* aspect is defined as the declarations or instructions of what and how data values should be assigned to the metadata element.

Addressing semantic interoperability at different levels leads to improved standardization in related communities and the correct implementation of standards at each level. Following all agreements, metadata produced are intended to be shareable from day one.

Conceptualizing Underlying Models

As early as 1923, Ogden and Richard published their famous *triangle of meaning* which illustrates the relationship between language, thought content, and referent.^[30] The graph implies that the referent of an expression (a word or another sign or symbol) is relative to different language users. The model was also adopted by researchers in library and information science as the basis for building knowledge organization systems (KOS).^[31] A working group of the International Federation of Library Associations and Institutions (IFLA) Functional Requirements for Subject Authority Records (FRSAR)^[32] has recently proposed a conceptual model that contains *thema* and *nomen* entities related to the *aboutness* of works in the bibliographic universe.^[33] In this instance *thema* means anything that can be the subject of a work. *Nomen* is any alphanumeric, aural, and visual (etc.) symbol or combination of symbols by which a *thema* is known, referred to, or addressed. The importance of this model for the subject authority data is to separate and distinguish the concepts (or topics and subjects) from how they are designated or represented. In different efforts to achieve global sharing and use of subject authority data, some have focused on *nomen* (e.g., a translated metadata vocabulary, a symmetrical multilingual thesaurus, or a multi-access index to a vocabulary). However, the majority of projects have concentrated on the *thema* level, e.g., mapping the concepts between two thesauri or between a thesaurus and a taxonomy. These concept-centric efforts usually encounter far greater challenges because they are concerned not only

with the concepts as such, but the relationships among them as well.

This thema–nomen conceptual model matches well with encoding languages such as SKOS, OWL, and more general encoding that uses RDF with Uniform Resource Identifiers (URIs) as the basis of a mechanism for identifying subjects, predicates, and objects in statements. SKOS defines classes and properties sufficient to represent the common features found in a standard thesaurus and is an example of the concept-centric view of vocabulary where primitive objects are not terms but abstract concepts represented by terms/labels. Each SKOS concept is defined as an RDF resource, and each concept can have RDF properties attached, which include: one or more preferred terms (at most one in each natural language); alternative terms or synonyms; and, definitions and notes with specification of their language.^[34] Established semantic relationships are expressed in SKOS and intended to emphasize concepts rather than terms/labels.

When the DCMI Abstract Model^[35] became a DCMI Recommendation in 2007, its one-to-one principle (i.e., each DC metadata description describes one, and only one, resource) was recognized or followed by more metadata standards (e.g., the newly released VRA Core 4.0).^[36] Under the one-to-one principle, a record can contain more than one *description set*. A description set contains *descriptions* composed of *statements* which use property–value pairs. The results are data which can then be processed, exchanged, referred to, and linked to at the statement level. At implementation, when a record contains descriptions of the resource, the individual descriptions also can be linked to the authority data that manages the *values* associated with those properties (e.g., the subject authority data, the property name authority data, and the geographic authority data). Such an information model is independent of any particular encoding syntax and facilitates the development of better mappings and cross-syntax translations.^[35] The conceptual model proposed by the FRSAR group corresponds to this abstract model because it allows any thema to be independent of any nomen, including any syntax that a nomen may use. This results in facilitating the sharing and reuse of subject authority data among not only the subject vocabularies themselves, but also among metadata resources.

SEMANTIC INTEROPERABILITY ACTIVITIES

The researchers at UKOLN (see the section “Semantic Interoperability in Different Processes”)^[19] proposed a list of the information life cycle activities in which the creators/authors, publishers, information systems managers, service providers, and end users are all involved. These activities include: 1) creation and modification; 2) publication; 3) acquisition, selection, storage, system and collection building; 4) cataloging (metadata, identification/

naming, registration), indexing, knowledge organization, knowledge representation, and modeling; 5) integration, brokering, linking, syntactic and semantic interoperability engineering; 6) mediation (e.g., user interfaces, personalization, reference, recommendation, and transfer); 7) access, search, and discovery; 8) use, shared application/collaboration, scholarly communication, annotation, evaluation, reuse, and work environments; 9) maintenance; and 10) archiving and preservation. While semantic interoperability issues seem to be relevant in each part of the information life cycle, they are paramount in activities 4 (cataloging), 5 (integration), and 6 (access).

In this section, we will narrow our focus to the activities concerned with metadata and KOS because they are the two areas of most interoperability efforts. In reports on data exchange and integration, data values in metadata records appear to lead to increased scrutiny with regard to the semantics of semantic interoperability. This is because most of the concerns are related to terms or codes controlled by some form of KOS. It is our observation, however, that in addition to providing controlled terms, names, and codes for metadata value spaces, KOS have a more important function: to model the underlying semantic structure of a domain and to provide semantics, navigation, translation through labels, definitions, typing, relationships, and properties for concepts.^[37,38]

KOS Interoperability

Knowledge organization systems have been recognized as the prerequisites to enhanced semantic interoperability.^[19] The term KOS is intended to encompass all types of schemes for organizing information and promoting knowledge management, including classification schemes, gazetteers, lexical databases, taxonomies, thesauri, and ontologies.^[39] Embodied as Web services, they facilitate resource discovery and retrieval by acting as semantic road maps, thereby making a common orientation possible for indexers and future users, either human or machine.^[38] Thus the term KOS refers to controlled vocabularies as well as to systems/tools/services developed to organize knowledge and to present the organized interpretation of knowledge structures.

Establishing and improving semantic interoperability in the whole information life cycle always requires the use of KOS.^[40] Sometimes new vocabularies need to be created (or extracted) first; in other cases, existing vocabularies need to be transformed, mapped, or merged.^[19] This is especially important—and challenging—if existing KOS are different with regard to structure, domain, language, or granularity. In a project conducted by the authors,^[41] over 40 KOS were found to have been involved in interoperability projects between 1980 and 2004. The sizes of differing KOS ranged from less than 100 to nearly one-quarter million terms depending on individual system requirements. Several of the projects

comprise different vocabularies, ranging from a dozen, e.g., the Renardus project^[42] and H.W. Wilson's combined heading list,^[43] to over one hundred, e.g., the Unified Medical Language System (UMLS),^[44] and many are multilingual. During the transforming, mapping, and merging of concept equivalencies, specific term representations formed with definite syntax are sought. Different types of equivalencies have been defined by various standards organizations. The complex requirements and processes for matching terms, which are often imprecise, may have a significant impact on the following aspects of vocabulary mapping: browsing structure, display, depth, nontopical classes, and the balance between consistency, accuracy, and usability. Various levels of mapping/linking can coexist in the same project, such as those identified by the Multilingual Access to Subjects (MACS) project:^[45] terminological level (subject heading), semantic level (authority record), and syntactic level (application).^[46]

Special challenges and controversial opinions have always overshadowed the projects that have attempted to map multilingual vocabularies. For example, equivalence correlation must be dealt with not only within each original language (intra-language equivalence), but also among the different languages (inter-language equivalence) involved. Intra-language homonymy and inter-language homonymy are also problematic semantic issues.^[47]

Taking a different view, Gilreath^[48] suggests that there are four basic requirements that must be harmonized in terminology work: concepts, concept systems, definitions, and terms. Further complications arise when perspectives of different cultures need to be integrated. With the assumption that all languages are equal in a crosswalk table, the central question is whether the unique qualities of a particular culture expressed through a controlled vocabulary—or classification—can be appropriately transferred during the mapping process.

In addition to language and cultural variants, KOS have different microstructures and macrostructures: they represent different subject domains or have different scope and coverage; they have semantic differences caused by variations in conceptual structuring; their degrees of specificity and use of terminology vary; and, the syntactic features (such as word order of terms and the use of inverted headings) are also different.

Metadata Interoperability

Metadata is also an extensively discussed topic within the domain of information exchange and integration activities. Metadata are structured, encoded data that describe characteristics of information-bearing entities (e.g., individual objects, collections, or systems) to aid in the identification, discovery, assessment, management, and preservation of the described entities. Metadata is often simply defined as “data about data” or “information about information.”^[9] In the literature, the words

“schema” and “element set” have been used interchangeably to refer to metadata standards. In practice, metadata element sets are standards for data structures and semantics. An element set is a group of elements useful for describing resources of a particular type, or for a particular purpose. Examples are the 15-element DC Metadata Element Set (DCMES)^[49] and DC Metadata Terms (an extended element set which complements the DCMES).^[50] The word “schema” usually refers to an entity that includes the semantic and content components of the element set(s) as well as the encoding of the elements with a markup language such as Extensible Markup Language (XML). Examples include the XML schemas for simple and qualified DC. In this discussion, when the term “schema” is used, it refers to a metadata standard, although the major focus is often on the semantics and content of the schema rather than the encoding.

The rapid growth of Internet resources and digital collections has been accompanied by a concurrent proliferation of metadata standards, each of which was designed to be based on the requirements of particular user communities, intended users, types of materials, subject domains, project needs, and much more. Problems arise in the creation of large digital libraries or repositories when metadata records are prepared according to so many diverse standards.

In recent years numerous projects have been undertaken by the many players and stakeholders in the information community toward achieving interoperability among different metadata standards and their applications. Ideally, a uniform standard approach would ensure maximum interoperability among resource collections. If all participants of a consortium or repository were required to use the same data structure standards, such as the MARC21 format^[51] or DCMES, a high level of consistency would be created and therefore maintained. This, of course, has been the approach in the library community for over a century and is the optimal solution to the interoperability problem. The uniform standardization method is only viable in the early stages of building a digital library or repository, before different schemas have been adopted by the participants. Although conceptually a simple solution, it is not always feasible. This is especially true in heterogeneous environments serving different user communities where components or collections contain different types of resources already described by particular, specialized schemas. Therefore, other mechanisms of achieving interoperability must be adopted. Implementing interoperability may be considered at different methodological levels:

1. Structure and semantics level—Efforts are focused on the structure and semantics of metadata elements, independent of any applications. Outcomes include derived element sets or encoded schemas, crosswalks, application profiles, and element registries.

2. Record level—Efforts are intended to integrate metadata records through the mapping of elements according to semantic meanings of the elements. Common results include converted records and new records resulting from combining values of existing records.
3. Repository level—With harvested records from varying sources, efforts at this level focus on mapping value strings associated with particular elements (e.g., terms associated with “subject” or “format” elements). The result enables cross-collection searching.^[52]

Common Methodologies

Knowledge organization systems and metadata interoperability efforts have implemented similar methodologies. In the following analysis, we use *vocabulary* to refer to both KOS vocabulary and metadata vocabulary (metadata element set). The projects mentioned in this section are examples only (see also longer discussions).^{[29][41][52]}

Derivation

A new vocabulary may be derived from an existing vocabulary which is seen as a “source” or “model” vocabulary. This ensures a similar basic structure and contents, while allowing different components to vary in both depth and detail for the individual vocabularies. Specific derivation methods include adaptation, modification, expansion, partial adaptation, and translation. In each case, the new vocabulary is dependent upon the source vocabulary (see Fig. 1). A current example is the Faceted Application of Subject Terminology (FAST)^[53] vocabulary which derives subject terms from the LCSH and modifies the syntax to enable a post-coordinate mechanism.^[54] Among the metadata standards, a significant number of lighter element sets (e.g., Text Encoding Initiative (TEI) Lite,^[55] MARC Lite,^[56] CDWA Lite)^[57] and various formats or different encoded schemas have been derived from comprehensive ones. Derivation can also occur in the encoding format (e.g., MARCXML,^[58] CDWA Lite), but the basic original content elements are retained. Many

derivations can be regarded as occurring inside a family, as with the MARC family which includes MARC21, MARCXML, Metadata Object Description Schema (MODS),^[59] and MARC Lite. A derived vocabulary could also become the source of a new vocabulary (as in the case of some translated vocabularies). Another variation might include the adaptation of an existing vocabulary, with slight modifications to accommodate local or specific needs. The degree of modification is relatively low in contrast to specially localized vocabularies such as application profiles (Fig. 1).

Localization and expansion

Even within a particular information community, there are different user requirements and distinctive local needs. The details provided in a particular vocabulary may not meet the needs of all user groups.

Based on the premise that metadata standards are necessarily localized and optimized for specific contents, the emergent concept of *application profiles* is typical for considering individual needs.^[60] While existing element sets are used as the basis for description in a unique digital library or repository, individual needs are met through a set of specific application guidelines or policies established for interest or user groups. Application profiles generally consist of metadata elements drawn from one or more metadata element sets that are combined into a single compound structure and encoded in a schema by implementers, and then optimized for a specialized local application.^[61,62] It should be noted that the DCMI community has recently developed a framework application profiles^[63] based on the DCMI Abstract Model,^[35] that emphasizes the *machine-processable* application profiles which encode metadata elements in machine-processable schemas employing markup languages.

An application profile may also be based on a single element set and then tailored to different user communities. For example, the DC-Library Application Profile (DC-Lib) elucidates the use of the DC metadata element sets in libraries and library-related specific applications and projects.^[64] In practice, the development of an application profile often involves the following steps: 1) selecting a “base” metadata namespace; 2) selecting elements from other metadata namespaces; 3) defining local metadata elements and declaring new elements’ namespaces; and 4) enforcing application of the elements (including cardinality enforcement, value space restriction, and relationship and dependency specification)^[62,65] (Fig. 2).

In thesaurus and classification development, a method known as *leaf nodes* has been used in which extended schemes for subtopics are presented as the nodes of a tree structure in an upper vocabulary. When a leaf node in one thesaurus is linked to a high level (e.g., “wetlands”), and more specific subtopics of that concept exist in a specialized vocabulary or classification system (e.g., “wetlands

Derivation of new vocabularies from a source vocabulary

Fig. 1 Derivation of new vocabularies from a source vocabulary.

Fig. 2 An application profile consisting of elements drawn from one or more metadata element sets.

classification scheme”), then the leaf node can refer to that specialized scheme.^[41] As with the application profile approach, a new vocabulary can be built on the basis of more than one existing vocabulary. A major task of the developers is to not be unnecessarily redundant. Rather, their primary role is to extend from nodes and grow localized vocabulary leaves (see Fig. 3).

With careful collaboration and management, *satellite vocabularies* can be developed around a superstructure in order to meet the needs of managing specialized materials or areas. The superstructure can exist physically (e.g., LCSH) or virtually (e.g., Getty’s Vocabulary Database).^[66] LCSH-based thesauri include the Legislative Indexing Vocabulary (LIV),^[67] the Thesaurus for Graphic Materials (TGM),^[25] and the Global Legal Information Network (GLIN).^[68] The English Heritage Project’s National Monuments Thesauri^[69] are composed of several separate online thesauri for monument types: archaeological objects, building materials, defense, evidence, maritime cargo, craft type, place name, and so on. These thesauri are displayed in an integrated space through a frame-based Web site. Terms are grouped by classes rather than by broadest terms (Top Term) and are cross-linked (Fig. 3).

Satellites under a superstructure are usually developed deliberately as an integrated unit and require top-

down collaboration for management. An alternative approach, though apparently similar in terms of processes, is to plug-in different pieces to an existing *open umbrella structure*. The reason is that, in the example of ontology development, the upper level of an ontology (i.e., the more general concepts) is more fundamental for information integration. Automatic methods may be used for the semantic organization of lower-level terminology.^[70] The responsibility of ensuring interoperability is that of the developers who will create the plug-ins to coordinate under the umbrella. Patel et al.^[19] identify a three-tier structure of upper-core-domain ontologies: 1) *upper ontologies* define basic, domain-independent concepts as well as relationships among them (e.g., CYC Ontology^[71] and WordNet);^[72] 2) *core (or intermediate) ontologies* are essentially the upper ontologies for broad application domains (e.g., the audiovisual domain); and 3) *domain ontologies* in which concepts and relationships used in specific application domains are defined (e.g., a “goal” in the soccer video domain). The core ontologies comprise concepts and relationships that are classified as basic in the broad application domain context, e.g., an event in the audiovisual domain. The concepts defined in domain ontologies correspond to the concepts and relationships established in both upper and core ontologies, which may be extended with the addition of domain knowledge (Fig. 4).

The *Digital Curation Center’s Digital Curation Manual: Installment on “Ontologies”*^[70] recommends that the editors of KOS first agree on a common upper-level ontology across disciplines in order to guarantee interoperability at the fundamental and functional levels. On the other hand, it is important to fully grasp the conditions and cost-benefit ratio of connecting an upper ontology and domain KOS: 1) the intended purpose—indexing and retrieval vs. automatic inferencing; 2) the alignment of the ontology and domain KOS; 3) the number of different KOS intended to be modeled; and 4) the use cases to be supported.^[73]

Fig. 4 Intermediate and domain vocabularies plugged-in under an open umbrella structure.

Mapping, crosswalking, and data conversion

The process of mapping essentially consists of establishing equivalencies between terms in different controlled vocabularies and between metadata element sets. In both cases the vocabulary may be presented in verbal terms and/or notation numbers in a scheme. Depending on the number of schemes involved in the process, two different models may be considered.

In *direct mapping*, one-to-one mapping is usually applied when two (or a limited few) schemes are involved. Almost all metadata standards have mapped their elements to the DC 15 elements defined by ISO 15836-2003.^[74] The MACS project mapped subject headings in three monolingual lists: Schlagwortnormdatei/Regeln für den Schlagwortkatalog (SWD/RSWK), Répertoire d'autorité-matière encyclopédique et alphabétique unifié (Rameau), and LCSH.^[46] Nevertheless, when using the direct mapping model, four schemes would require twelve (or six pairs of) mapping processes. This not only is extremely tedious and labor intensive, but also requires enormous intellectual exertion.

Cross-switching is another kind of model usually applied to reconcile multiple schemes. In this model, one of the schemes is used as the switching mechanism between the multiple schemes. Instead of mapping between every pair in the group, each scheme is mapped to the switching scheme only. Such a switching system can be a new system (e.g., the UMLS' Metathesaurus)^[75] or an existing system (e.g., the Dewey Decimal Classification (DDC)). Another example is Getty's crosswalk which allows multiple metadata schemas to all crosswalk to CDWA.^[76] For KOS and subject directories, this is the approach adopted by Renardus and a number of other projects. The Renardus project maps local class schemes to a common scheme: the DDC. Each DDC class that Renardus presents links to "related collections" which enables the user to then jump to the mapped classes in the participating local gateways while continuing to browse in the local classification structure. In addition, a virtual browsing feature allows the merging of all local related records from all mapped classes into one common Renardus result set^[77] (Fig. 5).

In the metadata community, the word *crosswalk* is established and commonly used among practitioners. Previously this format was also referred to as a *concordance* when subject headings were mapped and stored. A metadata crosswalk is "a mapping of the elements, semantics, and syntax from one metadata scheme to those of another."^[9] The mechanism used in crosswalks is usually a chart or table that represents the semantic mapping of data elements in one data standard (source) to those in another standard (target) based on similarity of function or meaning of the elements.^[78] According to the NISO document, *Issues in Crosswalking Content Metadata Standards*, common properties may include a semantic definition of each metadata element and other issues including:

- Whether a metadata element is mandatory or optional based on certain conditions.
- Whether a metadata element may occur once or multiple times within the same record.
- Constraints as to the organization of metadata elements relative to each other, (e.g., hierarchical parent-child relationships).
- Constraints imposed on the value of an element (e.g., free text, numeric range, date, or a controlled vocabulary).
- Optional support for locally defined metadata elements.^[79]

Major efforts in metadata mapping have produced a substantial number of crosswalks. Almost all schemas have created crosswalks to widely applied schemas such as DC, MARC, or Learning Object Metadata (LOM).^[80] Metadata specifications may also include crosswalks to a previous version of a schema as well as to other metadata schemas, e.g., the VRA Core 3.0^[81] and 4.0.^[36]

Two approaches have emerged in crosswalking practice. The *absolute crosswalking* approach requires exact mapping between involved elements (e.g., vra.title → dc.title) of a source schema (e.g., VRA Core) and a target schema (e.g., DC). Where there is no exact equivalence, there is no crosswalking (e.g., vra.technique → [empty space]). Absolute crosswalking ensures the equivalency (or closely equivalent

Fig. 5 Direct mapping and cross-switching.

matches) of elements, but does not work well for data conversion. The problem is the data values that cannot possibly be mapped, particularly when a source schema has a richer structure than that of the target schema. To overcome this problem, an alternative approach, *relative crosswalking*, is used to map all elements in a source schema to at least one element of a target schema, regardless of whether the two elements are semantically equivalent or not (e.g., *vra. technique* → *dc.format*). The relative crosswalking approach appears to work better when mapping from a complex to a simple (or basic) schema (e.g., MARC to DC), than the reverse.

Functionally, crosswalks should allow systems to effectively convert data and enable heterogeneous collections to be searched simultaneously with a single query as if within a single database. The reality is that crosswalks constructed from real data conversion may be very different from those based on metadata specifications. The major challenge in *converting records* prepared according to a particular metadata schema into records based on another schema is how to minimize loss, or distortion, of data. In studies by Zeng and colleagues,^[82,83] it was found that when data values were involved, converting may become imprecise and conversion tasks become more complicated. When the target schema is more inclusive and has defined elements and sub-elements with greater detail than the source schema, the values in a source metadata record may need to be broken down into smaller units (e.g., from DC elements to MARC records subfields). As mentioned above, the risk is that data values may be lost when converting from a complex to a simple structure in absolute crosswalking. Equally, granularity may be lost when

converting from a complex to a simple structure in relative crosswalking. Other vexing problems include converting value strings associated with certain elements that have rules for required, mandatory, or optional usage (in addition to the decisions about which controlled vocabularies are selected). Detailed explanations should be provided for as many contingencies that can be foreseen. Regrettably, most crosswalks focus only on element mappings that are based on *metadata specifications*, and not on *real data conversion results*. A recent study on metadata quality provides strong evidence for the impact of crosswalks on quality when converting large amounts of data.^[83] The most serious difficulties include misrepresented data values, important data values lost, incorrectly mapped elements and data values, and, missing elements. It is understood that collaborative approaches are needed in order to solve these problems. Zeng and Shreve recommend a set of approaches to correct many of the errors found in a metadata repository regarding data conversion:

1. Recreating and improving crosswalks.
2. Reharvesting records if quality reviews indicate the need.
3. Sponsoring and enforcing comprehensive standards and best practice guidelines for all elements.
4. Enriching data—both pre- and post-harvest—by automatic processes.
5. Supplying consistent mapping tables to past, present, and future data providers when harvesting is to be conducted.
6. Encouraging and ensuring active collaboration and open communication between repositories and local collection groups.

Co-occurrence mapping is similar to what was done in the MACS project where values in the subject fields of a record from different vocabularies are treated as equivalents. When a metadata record includes terms from multiple controlled vocabularies, co-occurrence of subject terms allows for an automatic, loose mapping between vocabularies. As a group, these loosely mapped terms can answer a particular search query or a group of questions. Existing metadata standards and best practice guides have provided the opportunity to maximize the co-occurrence mapping method. A good example is the VRA Core Categories versions 3.0 and 4.0, which recommend the use of AAT, LCSH, Thesaurus of Graphic Materials (TGM), ICONCLASS,^[84] and the Sears List of Subject Headings^[85] for culture and subject elements. Also, a Feature Class field of the gazetteer of the Alexandria Digital Library^[86] includes terms from two controlled vocabularies (ADL Feature Thesaurus and GNS Feature Classes) in one record.^[87] Additionally, metadata records often include both controlled terms and uncontrolled keywords. Mapped subject terms can be used as access points that lead to full metadata records. These *fielded-in* value strings associated with multiple sources may be integrated to enrich metadata records through automatic processes. As more co-occurrence types of mapping are widely applied, loosely mapped values will become very useful in productive searching with highly relevant results.

Crosswalking services mark a further stage of crosswalk development toward meeting the challenge of ensuring consistency in large databases that are built on records from multiple sources. Efforts to establish a crosswalking service at OCLC have indicated the need for robust systems that can handle validation, enhancement, multiple character encodings, and allow human guidance of the translation process.^[88] The OCLC researchers developed a model that associates three pieces of information: 1) crosswalk; 2) source metadata standard; and 3) target metadata standard. Researchers at the National Science Digital Library (NSDL)^[89] have also included a crosswalking service in their sequence of metadata enhancement services. These crosswalking services are a type of metadata augmentation operation that generates new fielded metadata values that are based on crosswalking from a source (schema or vocabulary) to a target (schema or vocabulary). The operation can be performed on either controlled or uncontrolled vocabulary value strings associated with specific elements.^[90] Both element-based and value-based crosswalking services assist in achieving semantic interoperability and improve the reusability of metadata in a variety of knowledge domains.

Registries, repositories, and web services

Registries and repositories for metadata and KOS vocabularies, powered by semantic technologies such as RDF,

SKOS, and OWL, have emerged in recent years. Their primary functions include registering, publishing, managing diverse vocabularies and schemas, as well as ensuring they are crosslinked, crosswalked, and searchable. Their presence promotes the wider adoption, standardization, and overall interoperability of metadata by facilitating its discovery, reuse, harmonization, and synergy across diverse disciplines and communities of practice.^[91]

The purpose of *metadata registries* is fairly straightforward: to collect data related to metadata schemas. Since the reuse of existing metadata terms is essential to achieving interoperability among metadata element sets, the identification of existing terms becomes a precondition of any new metadata schema development process. Metadata registries are expected to provide the means to identify and refer to established schemas and application profiles, as well as the means to crosswalk and map among different schemas.^[62] The importance of the management and disclosure roles of registries will increase as more metadata and application profile schemas are developed.

The basic components of a metadata registry include identification of data models, elements, element sets, encoding schemes, application profiles, element usage information, and element crosswalks. In addition to these common components, each registry usually has a specific scope and range. Registries can be categorized as:

- Cross-domain and cross-schema registries, e.g., UKOLN's SCHEMAS Registry.^[92]
- Domain-specific, cross-schema registries, e.g., UKOLN's MEG (Metadata for Education Group) Registry.^[93]
- Project-specific registries, e.g., The European Library (TEL) metadata registry^[94] whose purpose is recording all metadata activities associated with TEL.
- Standard-specific registries, e.g., DCMI Metadata Registry.^[91]

Metadata standards often specify vocabulary encoding schemes (such as controlled term lists, subject heading lists, name authority files, and thesauri) for use in value spaces associated with certain metadata elements or fields. Consequently, metadata registries may also contain, or link to, terms and codes from these schemes (e.g., DCMI Registry also includes the DCMI Type Vocabulary). Thus the term "metadata registry" could also refer to an integrated structure housing both metadata and terminologies.

At a minimal level, *terminology registries* hold *scheme information*, and list, describe, identify, and point to sets of KOS and other types of vocabularies (e.g., dictionaries) available for use in information systems and services. At a higher level, a terminology registry can comprise the *member* terms, classes, concepts, and relationships contained in a vocabulary (either monolingual or multilingual). Related to the terminology registries are *services*, which may also be listed in a terminology registry or

separately hosted in a *service registry*. These services, based on terminology, are used for automatic classification, term expansion, disambiguation, translation, and semantic reasoning.^[95] When registering member terms and classes, the scale of the vocabularies becomes significant, often containing hundreds and thousands of entries, along with the complicated relationships among them.

Efforts to register KOS begin with the set of common attributes that describe them. In 1998, researchers belonging to an informal interest group Networked Knowledge Organization Systems/Services (NKOS)^[96] began developing a set of elements for a registry for thesauri and other subject vocabularies. A taxonomy of KOS was developed so as to better differentiate the types and functions of subject vocabularies.^[97] In 2001, the registry reference document was extended to cover more types of KOS in the second version renamed the NKOS Registry.^[98] It includes two blocks of elements. The first block of elements, *KOS Title* through *Rights*, closely corresponds to the Dublin Core Element Set and is intended for creating metadata descriptions that will facilitate the discovery of KOS resources. The second block of elements is intended for the recording of specific characteristics of a KOS resource which will facilitate evaluation of the resource for a particular application or use. Another work, Vocabulary Markup Language: Metacode strawman DTD, was also proposed in 2001^[99] and has been an area of ongoing research by NKOS members.

The National Science Digital Library (NSDL) Registry project, funded by the National Science Foundation in 2005, was commissioned to develop and deploy an NSDL Registry to complement the existing NSDL Central Metadata Repository. The Registry is designed to conform to the DCMI Registry application, and so enables multiple diverse collection providers as well as other NSDL projects to identify, declare, and publish their metadata schemas (element/property sets) and encoding schemes (controlled vocabularies). Further, the project intends to provide support for registration of vocabulary encoding schemes and metadata schemas for use by human and machine agents, as well as to support machine mapping of relationships among terms and concepts in those schemes (semantic mappings) and schemas (crosswalks).

It is one of the production deployments of SKOS.^[100] The functions of the registry serve across metadata, terminology, and services.

Over the past several years, an eXtended MetaData Registry project has been jointly sponsored by several major government agencies^[101] and is currently hosted by the Lawrence Berkeley National Laboratory at the University of California. This project was initiated with the intent of developing improved standards and technology for storing and retrieving semantics of data elements, terminologies, and concept structures in registries. It plans to propose extensions of the ISO/IEC 11179 Metadata Registry (MDR)^[102] standards, create a prototype extended metadata registry, and load selected KOS into the prototype. The diverse types of complex semantic metadata (i.e., concepts), are registered in more formal, systematic ways (e.g., description logic) to facilitate machine processing of semantics in order to: 1) link together data elements and terms across multiple systems; 2) discover relationships among data elements, terms, and concepts; 3) create and manage names, definitions, terms, etc.; and 4) support software inference, aggregation, and agent services.^[103] This last function leads to what we will discuss next: *terminology services* (Fig. 6).

Terminology services are usually related to or include a registry, but are not limited to registering vocabularies. A terminology service can be defined as a group of *services* that present and apply vocabularies, member concepts, terms, classes, relationships, and detailed explanations of terms which facilitate semantic interoperability. The goals are ambitious: to enable searching, browsing, discovery, translation, mapping, semantic reasoning, automatic classification and indexing, harvesting, and alerting. Terminology services can be machine-to-machine or interactive; user-interfacing services can also be applied at all stages of the search process. For example, in supporting the needs of searching for concepts and the terms representing the concepts, the services can assist in resolving search terms, disambiguation, browsing access, and mapping between vocabularies. As a search support for queries, the services facilitate query expansion, query reformulation, and combined browsing and search. These can be applied as immediate elements of the end user

Fig. 6 Terms from metadata and KOS vocabularies registered and used/reused through Web services.

interface, or they can act in underpinning services behind the scenes, depending upon the context.^[104] Technologically, they use Web services to interact with controlled vocabularies, and this represents an entirely new dimension in KOS research and development.

A relevant example is OCLC's Terminology Services project.^[105] As of June 2008, mappings had been made for eight knowledge organization resources through direct mapping (associations between equivalent terms) and co-occurrence mapping (associations based on the co-occurrence of terms from different schemes in the same metadata or catalog record). Co-occurrence mappings are considered to be mapped more loosely than direct mappings, and usually have an intellectual review component.^[106] These services have made records accessible to users through a browser and to machines via the OAI-PMH Web services mechanisms.^[107] OCLC immediately began in 2007 to offer its Terminologies Service™ (more than 10 controlled vocabularies served through a single interface thus far) to its thousands of member institutions throughout the world. In addition to the ability of searching descriptions of controlled vocabularies and their member terms/headings, finding single terms/headings by their identifiers, and viewing term relationships, users can retrieve terms/headings in multiple representations such as HTML, MARC XML, SKOS, and Zthes specifications for thesaurus representation, access, and navigation.^[108]

The High Level Thesaurus (HILT) projects^[109]—a series of research projects funded by the U.K. Joint Information Systems Committee (JISC)—demonstrate a different approach. HILT is concerned with facilitating subject-based access across the broad spectrum of JISC collections that is combined with the automated discovery of relevant collections. HILT has investigated pilot terminology services in collaboration with OCLC Research and Wordmap. DDC was chosen as the central spine for mapping among major vocabularies such as DDC, LCSH, UNESCO Thesaurus,^[110] Medical Subject Headings (MeSH),^[111] and AAT. HILT Phase 3 focuses on developing a machine-to-machine demonstrator based on Web services, the Search/Retrieve Web Service (SRW) protocol,^[112] SKOS Core, and SKOS-type concept URIs. It is being designed so that end users will not access HILT directly; rather, they will be routed through Web-based user services.^[19,113]

Other current operational and experimental terminology services have been reviewed in detail in a report entitled *Terminology Services and Technology* prepared for JISC by Tudhope, Koch, and Heery in 2006.^[104] Since then, more projects have been initiated. The Semantic Technologies for Archaeological Resources (STAR) project, funded by the British Arts & Humanities Research Council (AHRC), is based at the University of Glamorgan. It aims to develop new methods for linking digital archive databases, vocabularies (and associated gray literature), and to exploit the potential of a high-level, core ontology, and natural language processing techniques.^[114] In collaboration with

English Heritage,^[115] a set of extensions to the CIDOC CRM^[21] core ontology have been produced as RDF files. Thesaurus data received from the English Heritage National Monuments Record Centre was converted into the standard SKOS RDF format for use in the project.^[116] The project has developed an initial set of Web services that are based on SKOS representations. The designed function calls can be integrated into a textual- or metadata-based search system. In addition to search and browse concepts in a thesaurus, the service supports semantic expansion of concepts for purposes of query expansion. By an automatic traversal of SKOS relationships, it yields a ranked list of semantically close concepts.^[73]

Another new UKOLN project, Terminology Registries and Services (TRSS), is examining how a registry might support the development of terminology and other services within the context of a service-oriented environment. In particular, it is analyzing issues related to the potential delivery of a Terminology Registry as a shared infrastructure service within the JISC Information Environment.^[95]

Although there is no official recognition or definition regarding the relationships between KOS and ontologies (particularly formal ontologies), there are *ontology repositories* that host formal ontologies, thesauri, and taxonomies together. Practically speaking, artifacts on the ontology spectrum are considered to have not only the OWL ontologies and axiomatized logical theories, but also include traditional and new structures/schemes, from controlled vocabularies, taxonomies, and thesauri to folksonomies, and from KOS schemes to data schema and data models.^[117]

An ontology repository is a facility where ontologies and related information artifacts can be stored, retrieved, and managed. One example is BioPortal,^[118] an open-source repository of ontologies, terminologies, and thesauri that is relevant to biomedicine, developed by the U. S. National Center for Biomedical Ontology. As of June 2008, users may access the BioPortal content (over 100 ontologies) interactively via Web browsers or programmatically via Web services. Downloading, searching, and visualizing are three basic functions of these OWL or Protégé ontologies. Users can search for content within a specific ontology, a group of ontologies, or across all ontologies in the library by: Class/Type Name, Class ID, and other attributes such as definitions and synonyms.

An Open Ontology Repository (OOR)^[119] initiative planning meeting was conducted in January 2008 by ONTOLOG,^[120] an open, international, virtual community of practice. OOR discussions have progressed through a series of mini-conferences that have culminated in the Ontology Summit. With the word “open” added, the ontology repository aims at implementation via open access and compliance with open standards: open technology (with open source), open knowledge (open content), open collaboration (with transparent community process), and

open integration with “non-open” repositories through an open interface.^[121] The project mission and charter of OOR are to

1. establish a hosted registry-repository.
2. enable and facilitate open, federated, collaborative ontology repositories.
3. establish best practices for expressing interoperable ontology and taxonomy work in registry-repositories.^[119,122]

Some current ontology registries/repositories do not provide concept-based mapping. Consequently, most results are based on terms representing concepts, for example, a search for “aging” in an ontology repository may find classes such as “biological imaging methods,” “imaging device,” and so forth that are not relevant to the query. The development of concept-based mapping will be a major and much-needed service, and it will also bring in its wake new challenges for ontology repositories.

CONCLUSION

Semantic interoperability plays a central role in information communication; it has a direct impact on a whole range of interoperability issues. This entry has discussed the importance of semantic interoperability in the networked environment, introduced various approaches contributing to semantic interoperability, and summarized different methodologies used in current projects that are focused on achieving semantic interoperability. The proliferation of repositories, interfaces, metadata models, and semantic technologies accentuates the need for semantic interoperability. The open, networked environment encompasses multiple user communities that employ a plethora of standards for describing and providing access to digital resources. To enable federated searches and to facilitate metadata sharing and management, many efforts have been initiated to address interoperability issues, to overcome numerous obstacles, and to address problems encountered along the way. Nevertheless, new and unforeseen interoperability difficulties continue to emerge. The complexity of interoperability does not stop at the international or industry standards level. Guidelines, rules, measurements, and certification are indispensable at the implementation level to ensure that available standards and technologies are optimized. The foundation of all of these requirements is global collaboration. It should be obvious that in order to build the true Semantic Web, not only must existing issues be addressed, but semantic problems of the future also need to be anticipated where possible.

Interoperability requires commonly agreed-upon standards and protocols at different levels for different levels of interoperability. The prospect is emerging for a broad set of standards across different aspects of terminology

services: persistent identifiers, representation of vocabularies, protocols for programmatic access, and vocabulary-level metadata in repositories.^[19] XML, RDF, RDFS, OWL, and SKOS are the high-level standards that will enable the achievement of semantic interoperability in the networked environment.

ACKNOWLEDGMENTS

The authors would like to thank Mr. Wm Joseph Robertson, Ms. Sarah Osinsky, and Mr. Haiqing Lin for their assistance in preparing this manuscript, and Dr. Doug Tudhope for sharing his internal reports.

Semantic Web

Kieron O'Hara
Wendy Hall

Intelligence, Agents, Multimedia Group, University of Southampton, Southampton, U.K.

Abstract

The “semantic web (SW)” is a vision of a web of linked data, allowing querying, integration, and sharing of data from distributed sources in heterogeneous formats, using ontologies to provide an associated and explicit semantic interpretation. This entry describes the series of layered formalisms and standards that underlie this vision, and chronicles their historical and ongoing development. A number of applications, scientific and otherwise, academic and commercial, are reviewed. The SW has often been a controversial enterprise, and some of the controversies are reviewed, and misconceptions defused.

INTRODUCTION

The semantic web (SW) is an extension, in progress, to the World Wide Web (WWW), designed to allow software processes, in particular artificial agents, as well as human readers, to acquire, share, and reason about information. Whereas the WWW consists largely of documents, which are generally created for human consumption, the SW will be a web of data, making them more amenable for computers to process.^[1] The data will be processed by computer via semantic theories for interpreting the symbols (hence: *semantic* web). In any particular application, the semantic theory will connect terms within a distributed document set logically, and thereby aid interoperability.

For instance, people use a lot of data in daily interactions, viewing bank statements, or digital photographs, or using diaries or calendars. But this does not constitute a web of data, because the data are neither exported from the applications in which they are stored or were created, nor linked to other relevant data. In a genuine web of data, such data could be used seamlessly in a number of applications. For example, one could view one's photographs (which will contain a time stamp) in one's calendar, which would then act as a prompt to suggest what one was doing when they were taken. The data which one uses would be to some extent freed from the constraints of particular applications, and instead could be interlinked and reused creatively.

As another example, Web services can currently be accessed and executed via the Web, but because the Web does not provide much information-processing support, services must be specified using semiformal languages and as with information retrieval humans need to be kept in the loop. Web services described using SW techniques should provide support for autonomous agents and automatic systems.^[2]

The world of linked information is a very unstructured, “scruffy” environment. The amounts of information that

systems need to deal with are very large indeed. Furthermore, systems must pull together information from distributed sources, where representation schemes can be expected to be highly heterogeneous, information quality variable, and trust in information's provenance hard to establish. SW technology needs to be based on standards that can operate in this heterogeneous information world.

The SW therefore requires two types of information standard to operate. First, it requires common formats for integrating information from these diverse sources. And second, it needs a language to express the mapping between the data and objects in the real world, in order to allow a seamless understanding of a distributed set of databases. Hence, for instance, we could signal that a database containing a column *zip code* and another database with a column labeled *ZC*, were actually both referring to the same concept with their different labels, and by creating such a semantic link, we could then start to reason over both databases in an integrated fashion. Such semantic links are often obvious to humans, but not to computers. A key formalism here is the *ontology*, which defines the concepts and relationships that we use in particular applications. Ontologies are central to the SW vision, as providing the chief means by which the terms used in data are understood in the wider context.^[1,3]

THE AIM OF THE SEMANTIC WEB

The aim of the SW is to shift the emphasis of reasoning from documents to data, for three reasons. First, it will facilitate data reuse, often in new and unexpected contexts. Second, it will help reduce the amount of relatively expensive human information processing. Third, it will release the large quantity of information, not currently accessible, that is stored in relational databases (RDBs) by making it directly machine-processable.^[4]

This implies that RDB objects must be exported to the Web as first-class objects, which in practice entails mapping them onto a consistent system of resource identifiers—called Universal Resource Identifiers (URIs—see below). The SW itself is a suite of languages and formalisms designed to enable the interrogation and manipulation of representations which make use of URIs.^[1]

It is hoped that the SW will exhibit the same *network effects* that promoted the growth of the WWW. Network effects are positive feedback effects connected with *Metcalfe's Law* that the value of a network is proportional to the square of the number of users/members. The more people share data that can be mapped onto URIs, the more valuable that data is. As value increases, more agents join the network to get the benefits, and include information that they own in the network which further increases its value. This, like the WWW model, is radically different from other models of the value of information, wherein value is dictated by *scarcity* (copyright, intellectual property restrictions, etc). In decentralized networks like the Web the value of information is dictated by *abundance*, so it can be placed in new contexts, and reused in unanticipated ways.

This is the dynamic that enabled the WWW to spread, when the value of Web documents was seen to be greater in information-rich contexts. One initiative to support the development of the SW is the creation of a discipline of *web science*, which is intended to exploit study of both technical and social issues to predict such matters with more accuracy.^[5,6]

If the SW is to grow in an analogous way, more data has to be exposed to the Web that can be mapped onto URIs. In practice, this means that the data must be exposed in the resource description framework (RDF), an agreed international standard whose role in the SW is described below^[7]; in particular, it can be used not only to assert a link between two resources, but also to name (and therefore make explicit) the relationship that links them. RDF is the language of choice for reuse, because it is a relatively inexpressive language compared to other formalisms used in the SW (see Fig. 1 for a pictorial representation of the layers of formalisms required for the SW vision—expressivity increases as we ascend the diagram). The importance of RDF in this model is dictated by the so-called principle of least power, which states that the less expressive the representation language, the more reusable the data.^[8]

The importance of growth is such that a stage can be reached when reuse of data—one's own or that of other people—is facilitated. There would ideally be so much information exposed in RDF that the contexts into which one's own data can be placed would be rich enough and numerous enough to increase its value significantly. RDF (as described below) represents information as a subject–predicate–object triple each of whose component parts is a URI. If the objects, resources, or representations referred

Fig. 1 The layered view of the semantic web.

Source: From A framework for Web Science, by T. Berners-Lee, W. Hall, J.A.; Hendler, K; O'Hara, N.; Shadbolt, D.J. Weitzner, Found. Trends Web Sci. 2006, 1 (1), 1–134.^[6]

to by the URIs are defined in ontologies, then this enables the interoperability at which the SW aims.

Hence another vital component in the SW is the development and maintenance of ontologies. These must be endorsed by the communities that use them, whether they are large-scale, expensive ontologies developed as a result of a major research effort, or relatively ad hoc creations intended to support small-scale collaboration.

Ontologies can also play an important role in bringing (representatives of) two or more communities together for a common purpose, by expressing a common vocabulary for their collaboration, onto which the terms of each discipline can be mapped. Such collaborative efforts are extremely important for reuse of content.^[3]

This is not to say that search and retrieval on the current Web is not of high quality; the methods pioneered by Google and others work very well. Nevertheless, keyword-based search techniques are vulnerable to a number of well-known flaws. Individual words can be ambiguous. A document can refer to a topic of interest without using the keyword. Keywords are language-dependent. Information distributed across several documents cannot be amalgamated by keyword search. And even though PageRank and related algorithms for search produce impressive results, the user still needs to read manually through the ordered list of retrieved pages, and inspect their content to determine relevance to his/her inquiry. This involvement of the user is a hindrance to scalability.

The SW should make more accurate querying possible, using ontologies to help with problems of ambiguity and

unused keywords, and data linking to query across distributed datasets. Furthermore, it should be able to go beyond current search with respect to the three issues of reuse, automation, and exploitation of RDBs. And as well as search and retrieval, the addition of information processing support to the Web will help promote other functions such as Web services and knowledge management.

COMPONENTS OF THE SEMANTIC WEB

At one level, the SW is a complex of formalisms and languages each doing a different job in the representation of information, as shown in Fig. 1. Each formalism is an internationally agreed standard (see below), and the composition of the functions these formalisms serve supports semantically enabled reasoning on data.

At the bottom of this diagram stands the URIs which identify the resources about which the SW provides reasoning capabilities.^[9] The universality of URIs is extremely important—i.e., it is vital that whatever naming convention is used for URIs is adopted globally, so as to create the network effects that allow the SW to add value. Interpretation of URIs must also be consistent across contexts. In other words, when we *dereference* URIs (i.e., when we locate the resource to which the URI refers), we should always get the same object. If these conditions about URI naming schemes are met, then making an association between a URI and a resource means that different people can refer or link to it consistently in their conversations. The other basic formalism, Unicode, is an industry standard that allows computers to represent text in different writing systems.

The next layer up, eXtensible Markup Language (XML), is a language to mark up documents, and a uniform data exchange format between applications.^[10] It allows the insertion of user-defined tags into documents that provide information about the role that the content plays. So, for instance, XML allows one to write a document describing a book, and also to *annotate* the document with machine-readable *metadata* to indicate e.g., who the authors of the book are.

RDF^[7] is a very minimal knowledge representation framework for the Web, which uses a basic subject–predicate–object structure, with the twist that it assigns specific URIs to its individual fields—including in the predicate position, thereby identifying a relationship between the entities identified by the connected nodes. This use of URIs allows us to reason not only about objects but also about the relationships between them. XML is a metalanguage that provides a uniform framework for markup, but it does not provide any way of getting at the *semantics* of data; RDF is the first step toward semantics.

The resource description framework schema (RDFS, sometimes known as RDF(S)^[11]) gives greater scope for sharing information about individual domains; whereas

RDF is a data interchange language that lets users describe resources using their own vocabularies, and makes no assumptions about the domains in question, RDFS provides a basic set of tools for producing structured vocabularies that allow different users to agree on particular uses of terms. An extension of RDF, it adds a few modeling primitives with a fixed meaning (such as class, subclass and property relations, and domain and range restriction).

A key component for SW applications is the *ontology*. Ontologies^[3] are shared conceptualizations of a domain which are intended to facilitate knowledge and information sharing by coordinating vocabulary and allowing basic inference of inheritance and attributes of objects. Several initiatives are developing ontologies, particularly in a number of sciences, which means that the scientists are likely to be among the important early adopters of SW technology (see below). RDFS is an important step toward the SW vision, as the addition of modeling primitives makes it a basic ontology representation language.

However, greater expressivity is likely to be required in the development of more complex ontologies, and the World Wide Web Consortium (W3C) has issued a Web Ontology Language (OWL^[12]) in multiple versions that allows ontologies to be not only represented but also checked for logical properties such as consistency. The three species of OWL are: 1) OWL Full, containing all the OWL primitives, allowing arbitrary combination of those primitives with RDF and RDFS (allowing changes in meaning even of predefined OWL or RDF primitives), but also providing so much expressive power as to make the language undecidable (i.e., it cannot be guaranteed that a computation using the full expressive power of OWL Full will be completed in a finite time); 2) OWL DL, which restricts application of OWL's constructors to each other, and corresponds to a decidable *description logic*, but which is not fully compatible with RDF; and 3) OWL Lite, which sacrifices even more expressive power to facilitate implementation and reasoning.^[12] This set of relations affects the downward compatibility of the SW layer diagram—the only version of OWL that is downward compatible with RDF and RDFS (i.e., so that any processor for that version of OWL will also provide correct interpretations of RDFS) is OWL Full, which is undecidable (pp.113–115).^[13,14]

All varieties of OWL use RDF for their syntax, and use the linking capabilities of RDF to allow ontologies to be distributed—ontologies can refer to terms in other ontologies. Such distributivity is a key property for an ontology language designed for the SW.^[15]

OWL supports some kinds of inference, such as subsumption and classification, but a greater variety of rules and inference is needed. Hence, work is currently ongoing on the Rule Interchange Format (RIF), which is intended to allow a variety of rule-based formalisms, including Horn-clause logics, higher order logics, and production systems, to be used.^[16] Various insights from Artificial

Intelligence (AI) have also been adapted for use for the SW, including temporal (time-based) logic, causal logic, and probabilistic logics.^[1]

Having represented data using RDF and ontologies, and provided for inference, it is also important to provide reliable, standardized access to data held in RDF. To that end, a special query language SPARQL (pronounced “sparkle”), which became a W3C recommendation in January 2008, has been designed.^[17] Logic and proof systems are envisaged to sit on top of these formalisms, to manipulate the information in deployed systems.^[1]

A very important layer is that of *trust*.^[18] If information is being gathered from heterogeneous sources and inferred over, then it is important that users are able to trust such sources. The extent of trust will of course depend on the criticality of the inferences—trust entails risk, and a risk-averse user will naturally trust fewer sources.^[19,20] Measuring trust, however, is a complex issue.^[21] A key parameter is that of provenance, a statement of: 1) the conditions under which; 2) the methods with which; and 3) the organization by which, data were produced. Methods are appearing to enable provenance to be established, but relatively little is known about how information spreads across the Web.^[22]

Related issues include respect for intellectual property, and the privacy of data subjects. In each case the reasoning abilities of the SW can be of value, and initiatives are currently under way to try to exploit them.^[23] Creative commons^[24] is a way of representing copyright policies and preferences based on RDF to promote reuse where possible (current standard copyright assumptions are more restrictive with respect to reuse). And research into the policy aware web is attempting to develop protocols to allow users to express their own privacy policies, and to enable those who wish to use information to reason about those policies.^[25] Cryptography protocols to protect information will also play an important role, as shown in Fig. 1.

ADDITIONAL FACTORS IN SEMANTIC WEB DEVELOPMENT

Infrastructure

Another important part of SW development is the infrastructure that supports it. In particular, if data is to be routinely published to the Web in RDF format, there must be information repositories that can store RDF and RDFS. These *triple stores* (so-called because they store the RDF triples) must provide reasoning capabilities as well as retrieval mechanisms, but importantly must be *scalable*. Examples of triple stores include JENA,^[26] 3store,^[27,28] and Oracle 11g.^[29] OWLIM is a repository which works as a storage and inference layer for the Sesame RDF database, providing reasoning support for some of the more

expressive languages of the SW, RDFS, and a limited version of OWL Lite.^[30,31]

Reasoners

As representation in the SW is more complex than in previous technologies, so is reasoning. The area of SW reasoning has been the focus of much research, in order to infer the consequences of a set of assertions interpreted via an ontology. In such a context, inference rules need clear semantics, and need to be able to cope with the diverse and distributed nature of the SW.

There are a number of important issues of relevance in this area: 1) Under what conditions is negation monotonic (i.e., the addition of new facts does not change the derivation of not-p), or nonmonotonic (including negation as failure, deriving not-p from the failure to prove p)?; 2) How should we handle conflicts when merging rule-sets?; 3) “Truth” on the Web is often dependent on context—how should a reasoner represent that dependence?; 4) How should scalability be balanced against expressivity?; 5) Logic often assumes a static world of given “facts,” but how should it be adapted to the SW, a much more dynamic space where propositions are asserted and withdrawn all the time?; and 6) The heterogeneous nature of the SW means that data in the SW is of varying trustworthiness; how should a reasoner deal with variable reliability? None of these questions has a “correct” answer, but any SW reasoning system needs to address them.

There has been a lot of research on SW reasoning, but an important desideratum is that a reasoner should support the W3C recommended formalisms, in particular supporting OWL entailment at as high a level as possible, and SPARQL querying. Examples include: Jena, an open source SW framework for Java, with a rule-based inference engine;^[32] Pellet, a sound and complete OWL-DL reasoner;^[33] and KAON2, an infrastructure for managing ontologies written in OWL-DL and other SW rule languages.^[34] For a short review of the problems and prospects for SW reasoning, see Fensel.^[35]

Bootstrapping

Bootstrapping content for the SW is one more important issue. Sufficient content is required for the hoped-for network effects to appear. There are initiatives to generate data in RDF and to expose it on the Web as a vital first step. The DBpedia^[36] is based on the Web 2.0 community-created encyclopedia Wikipedia, and is intended to extract structured information from Wikipedia allowing much more sophisticated querying. Sample queries given on the DPpedia Web site include a list of people influenced by Friedrich Nietzsche, and the set of images of American guitarists. DBpedia uses RDF, and is also interlinked with other data sources on the Web. When accessed in late 2007, the DBpedia dataset consisted of

103 million RDF triples. Other examples of linked data applications include the DBLP bibliography of scientific papers,^[37] and the GeoNames database which gives descriptions of millions of geographical features in RDF.^[38]

Even if RDF began to be published routinely, there is still a great deal of legacy content on the Web, and to make this accessible to SW technology some automation of the translation process is required. Gleaning Resource Descriptions from Dialects of Languages (GRDDL) allows the extraction of RDF from XML documents using transformations expressed in Extensible Stylesheet Language Transformations (XSLT) an extensible stylesheet language based on XML. It is hoped that such extraction could allow bootstrapping of some of the hoped-for SW network effects.^[39]

Annotating documents and data with metadata about content, provenance, and other useful dimensions (even including relevant emotional reactions to content^[40]) is also important for the effort to bring more content into the range of SW technologies.^[41] Multimedia documents, such as images, particularly benefit from such annotation.^[42] Again, given the quantities of both legacy data, and new data being created, methods of automating annotation have been investigated by a number of research teams in order to increase the quantity of annotated data available without excessive expenditure of resources.^[41,43,44]

The Social Context: Web Science

The SW vision has been delineated with some care by the W3C, and as has been seen involves an intricate set of connections between a number of formalisms, each of which is designed to do a certain job. As we will describe in the next section, that vision has altered and gained complexity over time.

In general, there are severe complications in the mapping between the microlevel engineering of Web protocols, and the macrolevel social effects that result from large-scale use of the Web. The combination of scales, effects, and phenomena involved is too large to be easily covered by a single discipline, even computer science. The social interactions enabled by the Web place demands on the Web applications underlying them, which in turn put requirements on the Web's infrastructure. However, these multiple requirements are not currently well-understood.^[45] Social studies tend to regard the Web as a given, whereas the Web is rather a world changeable by alterations to the protocols underlying it. Furthermore, the Web changes at a rate that is at least equal and may be faster than our ability to observe and analyze it.

The SW is a development bringing the Web vision to a new level of abstraction, yet the current state of our knowledge of the Web and its relation to off-line society leaves a number of questions unanswered about how it will impact at a large scale. In particular, it is unknown what social consequences there might be of the greater public exposure

and sharing of information that is currently locked in databases. Understanding these consequences is important partly because the developers of the SW want to build a technology that is not harmful to society thanks to emergent social effects, and partly because it is important that the SW goes with the grain of society, in order that it be effective in real-world situations.^[5]

To this end, in 2006 the Web Science Research Initiative (WSRI) was set up as a joint venture by the Massachusetts Institute of Technology and the University of Southampton to foster the interdisciplinary study of the Web in its social and technical context. WSRI's role includes crafting a curriculum for study across the various relevant disciplines; Berners-Lee.^[6] is a detailed review of the wide range of scientific and social-scientific research that is likely to be relevant, including graph and network theory, computer science, economics, complexity theory, psychology, law, etc.

HISTORY AND INTELLECTUAL BACKGROUND

The vision of a web of data was always implicit in the ideas underlying the development of the WWW, and was articulated by Sir Tim Berners-Lee at the first WWW conference in 1994. Berners-Lee is well known as the inventor of the WWW in 1989–1991, and has been a leading figure in the development of the SW. As well as holding chairs at the Massachusetts Institute of Technology, United States, and the University of Southampton, United Kingdom, Berners-Lee is the director of the W3C, which he founded in 1994.

A key moment in the development, and public perception, of the SW was an entry written for *Scientific American* by Berners-Lee, James A. Hendler, and Ora Lassila in 2001.^[46] This entry postulated the next stage of the WWW explicitly as one where data and information, as well as documents, are processed automatically, and envisaged a world where intelligent agents were able to access information (e.g., from calendars, gazetteers, and business organizations) in order to undertake tasks and planning for their owners.

This vision of automation of a series of routine information processing tasks has not emerged at the time of writing (2008). The article's agent-oriented vision distracted attention from the main point of the SW, the potential of a web of linked *data* (as opposed to documents) with shared semantics. Hence, in 2006, Berners-Lee, together with Nigel Shadbolt and Wendy Hall, published another article in the IEEE journal *Intelligent Systems*, which made that point explicitly, and argued that the agent-based vision would only flourish with well-established data standards.^[1]

The *Scientific American* article painted a very enticing picture, but its key message was less to do with the agents and more to do with the semantic information infrastructure that Berners-Lee et al. were advocating. Indeed, the

infrastructure will be used for many knowledge management purposes, not only in allowing agents to communicate. The agent-focused rhetoric of the article has prompted some to argue that the SW is a restatement of the program of AI in the 1960s and 1970s, and will share its perceived failures. We address this question below, in the section entitled “Controversies.”

In 2001 (and before), the conceptualization of the various formal layers of the SW was as shown in Fig. 2, with a fairly straightforward cascade up from URIs to XML and namespaces, to RDF and RDFS, through ontologies to rules, logic, proof and trust (the diagram has been widely distributed, but see e.g., Berners-Lee).^[47] Comparison with Fig. 1 shows how the details of the SW layers have had to be amended over time as implementation has continued. The requirements for expression of ontology-related information has led to an extra complexity from that envisaged in 2001, while the criticism of the SW vision based on the *Scientific American* article has led to a realization that not only the expressive formalisms need to be in place, but also tools and methods need to be created to allow use of SW technologies to integrate smoothly into organizations’ standard information workflows (e.g., Shadbolt, Vargas-Vera, Golbeck and Alani^[1,44,48,49]). This led to a top layer, User Interface, being added to the Fig. 2 structure at a later date.

Where intelligent agency has appeared—and there are currently several applications, including shopbots and auction bots—it has tended to be handcrafted and unable to interact with heterogeneous information types. This is largely because of a lack of well-established scalable standards for information sharing; however, progress is being made toward that goal, especially via the painstaking committee-based standards development processes instituted by the W3C. These standards are crucial for the SW to “take off,” and for the hoped-for network effects of a large number of users to emerge.^[1]

The SW vision has been implemented by standard bodies, such as the Internet Engineering Task Force (IETF) as

Fig. 2 The early layered view of the Semantic Web.

well as the W3C (the W3C is responsible for standards specific to the WWW), which have orchestrated efforts together with the user community to develop the languages at various levels to share meaning. Once standards are set by the W3C, they are called *recommendations*, acknowledging the reality that with the decentralization of the Web, and a lack of a central authority, standards cannot be enforced. The first RDF standard was specified in 1997 and became a W3C recommendation in 1999, thereby providing a minimal knowledge representation language for the Web with the clear backing of the nascent SW community.

Fixed standards for expressing ontologies appeared later in the process, with RDFS and OWL becoming recommendations in 2004. OWL evolved from other ontology language efforts, including Ontology Inference Layer (OIL)^[50] and DARPA Agent Markup Language (DAML)^[51] whose merged product, DAML+OIL, was the most important predecessor to OWL.^[52] In January 2008, the query language SPARQL became a W3C recommendation, while the RIF was under development in mid-2008.

Fig. 3, created in 2003, illustrates Berners-Lee’s vision of the pattern of SW development using the visual metaphor of a tide flowing onto a beach (this diagram is widely available, but see Connolly).^[53] From top to bottom in the diagram are the various layers of the SW diagram, from trust and proof down to data exchange and markup. From left to right come the various stages in a rough lifecycle from research to deployment: the first stage is a blue-sky research project; the second is the production of a stable system or formalism that is not a standard; the best aspects of these systems are then used as the bases for W3C standards, and the final stage is one of wide deployment. Hence, for instance, early ontology efforts like Cyc and description logics led to efforts such as DAML and OIL, which in turn helped create OWL. Wide deployment of OWL then results in a so-called web of meaning.

The “sea” of research and deployment approaches from the bottom left of Fig. 3 to the top right, as the “tide” comes in. Hence in 1998, various formalisms were in place for all the various levels of representation of the SW, but only XML was a Web standard and beginning to be used widely. By 2003, OWL and RDFS were close to their final forms, and RDF was beginning to be used widely for cross-application interoperability. At the time of writing, the “tide” has advanced further to the right, so work is ongoing on rule language RIF, and query language SPARQL became an official W3C recommendation in 2008. Meanwhile OWL is being used more frequently by ontology builders.

The SW’s history to date is largely one of standard-setting. However, it has also been argued that, analogous to other systems which have spread quickly and grown exponentially, what is needed is a “killer app” (i.e., an application that will meet a felt need and create a perception of the technology as “essential”). Less ambitiously, the SW’s spread depends not only on having an impressive set of formalisms, but also software tools to use

Fig. 3 A representation of the progress of semantic web development.

information represented in those formalisms.^[49] The SW is clearly not, at the time of writing, an information resource in routine use. Nevertheless, there are some applications where SW technologies are serving valuable purposes, and we review some of these in the next section.

real-world systems, before finally looking at some of the more successful academic efforts as judged by the SW development community itself.

Application Areas

There are areas where the SW is already an important tool, often in small focused communities with pressing information-processing requirements and various more or less common goals. Such communities can function as early adopters of the technology, exactly as the high energy physics discipline played a vital role in the development of the WWW. A series of case studies and use cases is maintained in w3.org’s Web site.^[54]

The most important application for SW technology is *e-science*, the data-driven, computationally intensive pursuit of science in highly distributed computational environments.^[55] Very large quantities of data are created by analyses and experiments in disciplines such as particle physics, meteorology, and the life sciences. Furthermore, in many contexts, different communities of scientists will be working in an interdisciplinary manner, which means that data from various fields (e.g., genomics, clinical drug trials, and epidemiology) need to be integrated. Many accounts of distinct and complex systems (e.g., the human body, the environment) consist of data brought from disciplines varying not only in vocabulary, but also in the scale of description; understanding such systems, and the

APPLICATIONS AND SYSTEMS

Properties of Systems

In general, SW projects tend to exhibit a few constant features. They generate new ontologies for the application domain (for example, art, or computer science), and use them to interrogate large stores of data, which could be legacy data or freshly harvested. Hence a body of evidence is building up that ontologies have an important role in mediating the integration of data from heterogeneous sources.

Furthermore, the results of SW projects are generally presented using custom-built interfaces. This hints at a very important research area, which is the development of scalable visualizers capable of navigating the graph of connected information expressed in RDF. As can be seen, the importance of applications and user interfaces was made clear in the latest version of the layered SW diagram (Fig. 1).

In this section we will look at active SW successes, focusing on application areas and types, then commercial/

way in which events at the microscale affect the macroscale and *vice versa*, is clearly an important imperative. Many scientific disciplines have devoted resources to the creation of large-scale and robust ontologies for this and other purposes. The most well-known of these is the *gene ontology*, a controlled vocabulary to describe gene and gene product attributes in organisms, and related vocabularies developed by open biomedical ontologies.^[56] Others include the protein ontology, the cell cycle ontology, Medical Subject Headings (MeSH, used to index life science publications), systematized nomenclature of medicine (SNOMED), and AGROVOC (agriculture, forestry, fisheries, and food).

E-government is another potentially important application area, where information is deployed widely, and yet is highly heterogeneous. Government information varies in provenance, confidentiality, and “shelf life” (some information will be good for decades or even centuries, while other information can be out-of-date within hours), while it can also have been created by various levels of government (national/federal, regional, state, city, and parish). Integrating that information in a timely way is clearly an important challenge (see for instance a pilot study for the United Kingdom’s Office of Public Sector Information, exploring the use of SW technologies for disseminating, sharing, and reusing data held in the public sector.^[57])

Commercial Activity

There is an increasing number of applications that allow a deeper querying of linked data. We have already discussed DBpedia,^[36] DBLP,^[37] and GeoNames.^[38] Commercial applications are also beginning to appear. Garlik^[58] is a company seeking to exploit SW-style technologies to provide individual consumers with more power over their digital data. It reviews what is held about people, harvesting data from the open Web, and represents this in a people-centric structure. Natural Language Processing is used to find occurrences of people’s names, sensitive information, and relations to other individuals and organizations. Declaration of interest: Wendy Hall is chair of the Garlik Advisory Board. Twine^[59] is intended to enable people to share knowledge and information, and to organize that information using various SW technologies (also, like Garlik, using Natural Language Processing). Twine’s developer Nova Spivack has coined the term “knowledge networking” to describe the process, analogous to the Web 2.0 idea of ‘social networking.’

The increasing maturity of SW technology is being shown by the growing number of successful vendors of SW technology. We have already seen OWLIM,^[31] which was developed by Ontotext, a semantic technology lab focused on technologies to support the SW and SW services based in Sofia, Bulgaria, and Montreal, Canada; Ontotext has been and is a partner in a number of major SW research projects.^[60] Ontoprise, based in Karlsruhe,

Germany, is a software vendor for implementing SW infrastructure in large, distributed enterprises; its products include OntoBroker, which provides ontology support using the W3C recommended languages OWL, RDFS and SPARQL, and Semantic MediaWiki+, a collaborative knowledge management tool.^[61] Asemanics, with offices in Italy, Holland, and the United Kingdom, uses a combination of Web 2.0 paradigms with SW technologies such as XML and RDF. The SW technologies are powerful representational tools but are often perceived as hard to use and search, so Asemanics attempts to exploit the perceived usability of Web 2.0 to present data in more widely accepted formats.^[62]

Academic Work: The Semantic Web Challenge

Much of the major work in the SW has been carried out in the academic sphere, and in funded research projects between academic and commercial partners, and is reported in journals and conferences (see end of entry for a list of the more importance conferences). Any review of academic work in this field will inevitably be selective; for the purposes of this entry we will focus on a particular effort to nurture applications, the *Semantic Web Challenge*.

The SW Challenge was created in 2003, and associated with the International Semantic Web Conference (ISWC) of that year. Since then it has become an annual competition to create an application that shows SW technology in its best aspects, and which can act as a “benchmark” application. Hence the SW Challenge gives us a series of illustrative applications thought by researchers’ peers to constitute best SW practice.^[63]

To meet the criteria for the Challenge, a tool or system needs to meet a number of requirements,^[64] which provide a useful characterization of the expectations governing an SW system, and are suggestive of the expected properties of SW applications. For instance, it should use information from sources that are distributed and heterogeneous, of real-world complexity and with diverse ownership. It should assume an open world, and that the information is never complete, and it should use some formal description of the meaning of the data. Optional criteria include a use of data in some way other than the creators intended, use of multimedia, and use of devices other than a PC. Applications need not be restricted to information retrieval, and ideally the system would be scalable in terms of the amount of data used and the number of distributed components cooperating. All these criteria indicate areas where SW systems would be expected to have an advantage.

The winners of the SW Challenge to date are as follows.

2003: CS AKTive Space (University of Southampton), an integrated application which provides a way to explore

the U.K. Computer Science Research domain across multiple dimensions for multiple stakeholders, from funding agencies to individual researchers, using information harvested from the Web, and mediated through an ontology.^[65]

2004: Flink (Vrije Universiteit Amsterdam), a “Who’s Who” of the SW which allows the interrogation of information gathered automatically from Web-accessible resources about researchers who have participated in ISWC conferences.^[66]

2005: CONFOTO (appmosphere Web applications, Germany), a browsing and annotation service for conference photographs.^[67]

2006: MultimediaN E-Culture Demonstrator (Vrije Universiteit Amsterdam, Centre for Mathematics and Computer Science, Universiteit van Amsterdam, Digital Heritage Netherlands and Technical University of Eindhoven), an application to search, navigate, and annotate annotated media collections interactively, using collections from several museums and art repositories.^[68]

2007: Revyu.com (Open University), a reviewing and rating site specifically designed for the SW, allowing reviews to be integrated and interlinked with data from other sources (in particular, other reviews).^[69]

CONTROVERSIES

The SW vision has always generated controversy, with a number of commentators being highly skeptical of its prospects. Let us briefly review some of the disputed issues.

The Semantic Web as “Good Old-Fashioned Artificial Intelligence”

One view holds that the SW is basically a throwback to the project to program machine intelligence which was jokingly christened by John Haugeland “GOFAI” (good old-fashioned AI). This proved impossible: so much of human intelligence is implicit and situated that it was too hard a problem to write down everything a computer needed to know to produce an output that exhibited human-like intelligence. For instance, if a human is told about a room, further explanations that a room generally has a floor, at least three walls, usually four, and a ceiling, and some method of ingress that is generally but not always a door, are not required. But a computer needs to be told these mundane facts explicitly—and similarly every time it is introduced to a new concept.^[70]

One attempt to work around this problem is the Cyc project, set up in 1984, which aims to produce a gigantic ontology that will encode all commonsense knowledge of the type about the room given above, in order to support human-like reasoning by machines.^[71] The project has always aroused controversy, but it is fair to say that over

two decades later, GOFAI is no nearer. The implicit nature of commonsense knowledge arguably makes it impossible to write it all down.

Many commentators have argued that the SW is basically a re-creation of the (misconceived) GOFAI idea, that the aim is to create machine intelligence over the Web, to allow machines to reason about Web content in such a way as to exhibit intelligence.^[72,73] This, however, is a misconception, possibly abetted by the strong focus in the 2001 *Scientific American* article on an agent-based vision of the SW.^[46] Like many GOFAI projects, the scenarios in that article have prominent planning components. There is also continuity between the AI tradition of work on formal knowledge representation and the SW project of developing ontologies (see below).

The SW has less to do with GOFAI as with context-based machine reasoning over content (and the provision of machine-readable data on the Web). The aim is not to bring a single ontology, such as Cyc, to bear on all problems (and therefore implicitly to define or anticipate all problems and points of view in the ontology definition), but rather to allow data to be interrogated in ways that were not anticipated by their creators. Different ontologies will be appropriate for different purposes; composite ontologies can be assembled from distributed parts (thanks to the design of OWL); and it is frequently very basic ontologies (defining simple terms such as “customer,” “account number,” or “account balance”) that deliver large amounts of content. It is, after all, a matter of fact that people from different communities and disciplines can and do interact without making any kind of common *global* ontological commitment.^[1,6,74]

Indeed, we can perhaps learn from the experience of hype and reaction that accompanied the development of AI. There has been a great deal of criticism of AI, but much has been learned from AI research and some AI methods and systems are now routinely exploited in a number of applications. The same may be expected of the SW. We should not expect to wake up one morning with the SW implemented and ready for use. Rather, a likelier model is that SW technologies will be incorporated into more systems “behind the scenes” wherever methods are needed to deal with signature SW problems (large quantities of distributed heterogeneous data).

Arguments for and against Ontologies

The importance of ontologies for the SW has been another point of friction with those who believe the program unrealistic. Ontologies are seen as expensive to develop and hard to maintain. Classification of objects is usually done relative to some task, and as the nature of the task changes, ontologies can become outdated. Classifications are also made relative to some background assumptions, and impose those assumptions onto the resulting ontology. To that extent, the expensive development of ontologies

reflects the world view of the ontology builders, not necessarily the users. They are top-down and authoritarian, and therefore opposed to the Web ethos of decentralization and open conversation. They are fixed in advance, and so they don't work very well to represent knowledge in dynamic, situated contexts.^[75–77]

Furthermore, say the critics, the whole point of the Web as a decentralized, linked information structure is that it reflects the needs of its large, heterogeneous user base which includes very many people who are naïve in their interactions. The infrastructure has to be usable by such people, which argues for simplicity. The rich linking structure of the current Web, combined with statistically based search engines such as Google, is much more responsive to the needs of unsophisticated users. The SW, in contrast, demands new information markup practices, and corporations and information owners need to invest in new technologies. Not only that, but current statistical methods will scale up as the number of users and interactions grows, whereas logic-based methods such as those advocated by the SW, on the other hand, scale less well (cf., e.g., Zambonini).^[78]

Folksonomies

One development as part of the so-called Web 2.0 paradigm (of systems, communities, and services which facilitate collaboration and information-sharing among users) that has drawn attention in this context is that of the “folksonomy.” Folksonomies have arisen out of the recent move to allow users to “tag” content on Web 2.0 sites such as the image-sharing site Flickr, and the video-sharing site YouTube. Having seen content, users are allowed to tag it with key words, which, when the number of users has become large enough, results in a structure of connections and classifications emerging without central control. Their promoters argue that folksonomies “really” express the needs of their users (since all the structure has arisen out of their user-based classifications), whereas ontologies “really” express the needs of authorities who can “impose” their views from the top-down.^[76]

However, folksonomies are much less expressive than ontologies; they are basically variants on keyword searches. A tag “SF” may refer to a piece of science fiction, or to San Francisco, or something else from the user's private idiolect. Indeed, that ambiguity arises even if we make the unrealistic assumption of a monoglot English user community. Once we realize speakers of other languages will use a system, then there are further possible ambiguities—for instance, in German “SF” might refer to the Swiss television station Schweizer Fernsehen.

Resolving This Controversy

When a community is large enough and the benefits clear, then a large-scale ontology building and maintenance

program is justified. In a recent note, Berners-Lee argues that such conditions will be perhaps more frequently encountered than skeptics believe. On the very broad assumptions that the size of an ontology-building team increases as the order of the log of the size of the ontology's user community, and that the resources needed to build an ontology increase as the order of the square of community size, the cost per individual of ontology building will diminish rapidly as user community size increases. Of course these assumptions are not intended to be deeply realistic, so much as indicative of how the resource implications diminish as the community increases in size. Berners-Lee's moral: “Do your bit. Others will do theirs.”^[74]

Even so, not all ontologies need to be of great size and expressive depth. Certainly the claim that has been made that the SW requires a single ontology of all discourse on the model of Cyc, but this is not backed up by the SW community. Such an ontology, even if possible, would not scale, and in a decentralized structure like the Web its use could not be enforced. We should rather expect a lot of use of small-scale, *shallow* ontologies defining just a few terms that nevertheless are widely applicable.^[74] Experience in building real-world SW systems often shows that expectations about the cost and complexity of the ontologies required are overblown, and the ontology-building process can be relatively straightforward and cheap.^[79]

For example, the machine-readable friend-of-a-friend (FOAF) ontology is intended to describe people, their activities, and their relations to other people. It is not massively complex, and indeed publishing a FOAF account of oneself is a fairly simple matter of form-filling (using the FOAF-a-matic tool).^[80] But the resulting network of people (showing their connections to other people) has become very large indeed. A survey performed in 2004 discovered over 1.5 million documents using the FOAF ontology.^[81]

With respect to Folksonomies, it is important to note that ontologies and folksonomies serve different purposes. Folksonomies are based on word tags, whereas the basis for ontology reference is via a URI. One of the main aims of ontology definition is to *remove* ambiguity—not globally, for this may well be impossible, but rather within the particular context envisaged by the developer (see the section on “Symbol Grounding” below). Folksonomies will necessarily inherit the ambiguity of the natural language upon which they are based. And while folksonomies emerge from data-sharing practices, it is not necessarily the case the ontologies are authoritarian; rather, the latter should ideally be *rationalizations* of current sharing practice. This does entail departure from current practice, but not necessarily of great magnitude. Indeed, a strong possibility is to use cheaply gathered folksonomies as starting points for ontology development, gradually morphing the Web 2.0 structures into something with greater precision and less ambiguity.^[82]

Symbol Grounding

An important aspect of the SW is that URIs must be interpreted consistently. However, terms and symbols are highly variable in their definitions and use through time and space. The SW project ideally needs processes whereby URIs are given to objects, such that the management of these processes is by communities and individuals, endorsed by the user community, who ensure consistency. This URI “ownership” is critical to the smooth functioning of the SW.^[1]

But the process of *symbol grounding* (i.e., ensuring a fixed and known link between a symbol and its referent) is at best hard, and at worst (as argued by Wittgenstein, for instance) impossible.^[83,84] Meanings do not stay fixed, but alter, often imperceptibly. They are delineated not only by traditional methods such as the provision of necessary and sufficient conditions, but also by procedures, technologies and instrumentation, and alter subtly as practice alters.

Any attempt to fix the reference of URIs is a special case of symbol grounding, and is consequently hard to do globally. It is certainly the case that attempting to resist the alteration in community practices and norms, and reformulation of meanings of terms, would be doomed.

Yorick Wilks has argued that since much knowledge is held in unstructured form, in plain text, automatic Natural Language Processing techniques, statistically based, can be used to “ground” meanings of terms for the SW.^[73] Berners-Lee, on the other hand, maintains that the SW is necessarily based on logic and firm definitions (even if those definitions were imperfect, or highly situated and task-relative), not words, use patterns and statistics. Wilks’ point is that the aim of defining terms in logic is too idealistic, and anyway depends on false assumptions about ordinary word meaning. Berners-Lee’s counterargument is, in effect, that though meanings are not stable, they can be stable *enough* relative to individual applications and in particular contexts to allow the SW approach to work.

CONCLUSION

The SW has been somewhat misunderstood in some commentaries. Its aim is not to force users to accept large ontologies remote from data-sharing practice imposed by shadowy authorities. Neither is it intended to produce a theory of all discourse, or to reproduce GOFAL. Rather, it is intended to shift the emphasis of the Web from being a web of documents to a web of linked *data*. It is the development of formalisms and technologies facilitating the creation, sharing, and querying of linked data using sharable ontologies to establish common interpretations. For this reason, an alternative name for the SW is the *web of linked data*.

The SW is a work in progress. As it stands, the “buy in” to the SW has not yet produced the desirable network effects, although several disciplines are enthusiastic early adopters of the technology (e.g., the e-science community). And there are still several important research issues outstanding. It is not yet known how best to: 1) query large numbers of heterogeneous information stores at many different scales; 2) translate between, merge, prune, or evaluate ontologies; 3) visualize the SW; and 4) establish trust and provenance of the content.

As complex technologies and information infrastructures are developed, there is a dynamic feedback between requirements, analysis, engineering solutions, and hard-to-predict global behavior of human, machine, and hybrid systems. Understanding how basic engineering protocols governing how computers talk to each other can result in social movements at a very different level of abstraction is very hard, yet essential to realizing the SW vision. Indeed, such understanding, the defining purpose of the discipline of *Web Science*, is essential to ensuring that *any* Web-based information structure is beneficial.^[5]

Semiotics

Marcel Danesi

Department of Anthropology, University of Toronto, Toronto, Ontario, Canada

Abstract

This entry deals with the main goals, theories, concepts, and practices of semiotics, as a science of meaning. Based on the fundamental notion of *sign*—anything that has the capacity to stand for something else (real or imagined)—semiotics has a long history behind it that overlaps with those of philosophy and language study. The main notions that undergird the practice of semiotics are examined closely here. These include denotation, connotation, opposition, text, code, and structure. Denotation is the intensional meaning assigned to a sign, while connotation refers to the extensional meanings it gains through usage. Opposition is the technique of sifting out minimal differences in meaning among signs so as to extrapolate an overall meaning structure from them. A text is a form constructed with signs in a structured fashion in order to convey some message; it includes verbal forms (such as books, conversations, etc.) and nonverbal forms (such as body language, paintings, etc.). Codes are the systems that organize the meanings that signs bear in social contexts (language, music, etc.), and structure is the notion that signs bear a patterned relation with each other and that it is through this very relation that they bear meaning.

INTRODUCTION

Semiotics is the discipline that aims to study signs and their functions. A *sign* is any physical form that stands for something other than itself to a specific individual or group in some specific context. A cross figure is such a form. It consists of two lines crossing at right angles. But most people who come across this form in our culture would hardly interpret it as a random (meaningless) shape consisting of two intersecting lines. Rather, they would tend to interpret it as standing for the arithmetical plus sign or for the religion of Christianity, among other things. It all depends on who uses it and in what context it is used. As a form occurring in a math book it would probably stand for the plus sign; as a figure made from two pieces of wood located on a church roof, it would stand instead for Christianity.

Today, semiotics is used mainly as methodological tool to study such sign-based phenomena as body language, art forms, discourses, visual communication, media, advertising, narratives, language, clothing, cuisine, rituals—in a phrase, anything that constitutes meaning-based social activity or behavior. For this reason, it is often referred to as the “science of meaning.” One of its modern-day founders, the Swiss philologist Ferdinand de Saussure (1857–1913), defined it as the science concerned with “the role of signs as part of social life” and “the laws governing them.”^[1]

HISTORICAL SKETCH

The term *semiotics*—from Greek *sēmeiotikos* “observant of signs”—was coined by Hippocrates (ca. 460–370 B.C.E.),

the founder of Western medicine, to designate the study of the symptoms produced by the human body. Hippocrates argued that the particular physical form that a symptom takes—a *semeion* (“mark”)—constitutes a vital clue for finding its etiological source. The form stands not for itself, but for “something invisible”—a disease, malady, or ailment. The concept of *semeion* as a bodily or natural sign was expanded a little later to include human-made forms (such as words) that stood conventionally for ideas or cognitive states. Among the first to tackle the role of conventional signs in cognition was the Greek philosopher Plato (ca. 427–347 B.C.E.), who saw them as forms referring not to specific referents, but to all referents that resemble each other in some identifiable way. For example, the *circle* form does not refer to a singular thing (although it can if need be), but to anything that has the property “circularity.” No matter what “size” the circle form has it is always interpreted as a “circle.” For this reason, Plato argued that signs are not simple replacements for things—a particular drawing of a circle can be altered in size, but it will still be perceived as a circle because it possesses the property of circularity. Plato’s pupil Aristotle (384–322 B.C.E.) argued instead that signs start out as practical devices that do indeed allow us to name singular (specific) things, rather than generic properties (circularity, roundness, etc.). We discover that things have such properties as we go along naming them. It is at such points of discovery that we create more abstract referential domains—words, symbols, etc.—indicating “categories” (plants, animals, objects, etc.).

Eventually, the question arose as to whether or not there was any connection between natural and conventional signs. The Stoics were among the first to deal with this question around 300 B.C.E., arguing that conventional

signs are “evaluative structures,” so to speak, that simply preserve for a specific group what people in that group assess to be useful or important; whereas symptoms (natural signs) are “response structures” produced by biology. The same question was taken up by St. Augustine (354–430 C.E.) in his *De Doctrina Christiana*, in which he describes natural signs (*signa naturalia*) as forms lacking intentionality and conventional ones (*signa data*) as products of human intentions. The former include not only bodily symptoms, but also the colors of plants, the signals that animals emit, and so on; the latter include not only words, but also gestures and the symbols that humans invent to serve their psychological, social, and communicative needs (pp. 24–56).^[2]

For some reason, interest in signs waned shortly after St. Augustine’s writings. It was rekindled in the eleventh century by the Scholastics. Using Augustine’s philosophical ideas and Aristotelian logic as their frames of reference, they asserted that signs captured truths, not simply evaluated them (as the Stoics had claimed). So, a word such as *tree* captured the existence of something real and true—a specific and recognizable type of arboreal plant. But within Scholasticism there were some scholars—called *nominalists*—who argued that “truth” was a matter of subjective opinion and that signs captured, at best, only illusory and highly variable human versions of it. John Duns Scotus (ca. 1266–1308) and William of Ockham (ca. 1285–1349), for instance, stressed that signs, once invented, ended up referring to other signs producing a kind of existential circularity—a perspective that is strikingly akin to some modern theories of the sign. So, for the nominalists, the word *tree* is meaningful because users of the word believe that a particular plant requires identification. The same plant could easily have been subsumed under some other botanically named category (as a subspecies of that category). In effect, there is no truth, just our interpretation (or evaluation) of it. The renowned theologian St. Thomas Aquinas (ca. 1225–1274) countered, however, that one cannot deny that signs such as *tree* refer to real things. The names for these things may vary, but not the “truth” that they exist as such. At about the same time, the English philosopher and scientist Roger Bacon (ca. 1214–1292) developed one of the first comprehensive typologies of signs, claiming that, without a firm understanding of the role of signs in the construction of knowledge, discussing what truth is or is not would end up being a trivial matter of subjective opinion. The first step in understanding how information (raw facts) becomes knowledge is in understanding how signs are used to organize it. Plants constitute an information system, so to speak. They become part of organized knowledge (botany) the instant they are named. Naming the world of objects, events, things, plants, flowers, animals, beings, ideas, etc. allows people to organize the world conceptually, that is, to remember it through the words themselves. Without names the world would not have parts to it, at

least in human cognition. Naming practices bring out what parts are useful or necessary to specific cultures and their knowledge schemes.

It was British philosopher John Locke (1632–1704) who first put forward the proposal of incorporating sign study, which he termed *semeiotics* (recalling Hippocrates’s term), into philosophy in his *Essay Concerning Human Understanding* (1690).^[3] For Locke, semeiotics was useful as an investigative instrument for philosophers, not as a distinct discipline. He thus defined it as the “doctrine” of signs, with *doctrine* meaning “system of principles.” The idea of fashioning an autonomous discipline of sign study did not emerge until the late nineteenth century, when the Swiss philologist Ferdinand de Saussure (mentioned above) put such an idea forward in his *Cours de linguistique générale* (1916), a textbook compiled after his death. Saussure used the term *sémiologie* (English *semiology*) to designate the new discipline. He suggested that the main goal of semiology was to understand the social functions of signs—that is, to study how signs allow people to refer to things in their social environments in specific ways and how these permit people to interact meaningfully.

Today, Locke’s term (*semeiotics*), spelled *semiotics*, is the preferred one. It was reintroduced by another modern-day founder of the discipline, the American pragmatist philosopher Charles S. Peirce (1839–1914), becoming the term adopted by the International Association of Semiotic Studies in the year of its establishment, 1969. The term *significs*, coined by Victoria Lady Welby (1837–1912) in her correspondence with Peirce, is also used occasionally in the technical literature, but with a specific sense—the study of the relation of signs to the senses and the emotions. Although his writing style is rather dense, Peirce’s ideas have come to constitute the theoretical platform upon which the study of signs is now elaborated.^[4] Perhaps Peirce’s greatest insight is that signs are “informed hunches” as to what something means in human terms. In other words, we sense a necessary psychological relation between the sign-forms we create and use and the things they stand for.

Following on the coattails of Saussure and Peirce, a number of key scholars developed semiotics into the sophisticated discipline that it has become today. Only a few can be mentioned here. The philosopher Ludwig Wittgenstein (1889–1951) suggested that signs were pictures of reality.^[5] Each time we utter or hear a word such as *tree*, a generic image of the plant comes inevitably to mind. When we combine it with *apple*, that image is rendered more precise (in contrast to, say, a *fig tree*). Wittgenstein’s view of the sign continues to inform a large part of semiotic theory and practice. The American semiotician Charles Morris (1901–1979) divided semiotic method into: 1) the study of sign assemblages, which he called *syntactics*; 2) the study of the relations between signs and their referents, which he called *semantics*; and 3) the study of the relation between signs and their social uses, which he called *pragmatics*.^[6,7] The Russian-born

American semiotician Roman Jakobson (1896–1982) studied various facets of sign construction, but is probably best known for his semiotic model of communication, which suggests that sign exchanges in communication are hardly ever neutral but involve subjectivity and goal-attainment of some kind—that is, when we speak we intend to get something out of it, and the nature of the signs used bears this out.^[8] The French semiotician Roland Barthes (1915–1980) illustrated the power of using semiotics for unmasking the hidden meanings in popular spectacles such as wrestling matches and Hollywood blockbuster movies (1957). French semiotician Algirdas J. Greimas (1917–1992) developed the branch of semiotics known as *narratology*, which studies the underlying structure of narratives.^[9] The late American semiotician Thomas A. Sebeok (1920–2001) expanded the semiotic paradigm to include animal signaling systems, which he termed *zoosemiotics*, and sign use among all species (including plants), which has come to be called *biosemiotics*.^[10] The interweaving and blending of ideas, findings, and scientific discourses from different disciplinary domains was, Sebeok claimed, the distinguishing feature of semiotics. Finally, Italian semiotician Umberto Eco (b. 1936) has contributed significantly to our understanding of how we interpret sign assemblages such as texts.^[11] For example, a *closed* text, such as a traditional detective novel, revolves around clues that lead inescapably to the identity of the perpetrator of a crime. This is the goal of that type of text, unless it is constructed to accomplish something more (such as the mystery stories of Alfred Hitchcock). On the other hand, an *open* text, such as a novel by James Joyce or Virginia Woolf, leaves the interpretive domain open, since it does not lead to an inescapable conclusion (as does a detective novel).

MEANING

The underlying object of semiotic inquiry is, as mentioned, what *meaning* is and how it unfolds in human activities. What is meaning? A little reflection will reveal that *meaning* is a confusing term. As the psychologists Charles Ogden and I. A. Richards showed in their classic 1923 work, *The Meaning of Meaning*, there are at least 23 meanings of this word in English.^[12]

He <i>means</i> to study jurisprudence. =	“intends”
A red light <i>means</i> stop. =	“indicates”
True love <i>means</i> everything. =	“has Importance”
The way she stared was full of <i>meaning</i> . =	“special import”
Does life have a <i>meaning</i> ? =	“purpose”
What does that word <i>mean</i> to you? =	“convey”
And so on.	

To avoid ambiguity, the terms *semiosis* and *signification* are used instead by semioticians. The former refers to the psychological process itself of producing and recognizing specific forms as signs (p. 32, 41).^[13] The latter is the

mental image that crops up in the brain the instant a sign is used. Signification involves two main meaning-making processes—reference and sense. Reference is the process itself of identifying something in the sign-form; sense is what that form elicits psychologically, historically, and socially. Signs (such as words) may refer to the same (or similar) things, known as *referents*, but they have different senses. For example, the “long-eared, short-tailed, burrowing mammal of the family Leporidae” can be called *rabbit* or *hare* in English. Both words refer essentially to the same kind of mammal. But there is a difference of sense between the two words—*hare* is the more appropriate term for describing the mammal if it is larger, has longer ears and legs, and does not burrow. Another difference is that a *rabbit* is often perceived to be a “pet,” while a *hare* is unlikely to be perceived as such. The German philosopher Gottlob Frege (1848–1925) was among the first to point out the difference between sense and reference,^[14] which he called *Sinn* and *Bedeutung* respectively. This same dichotomy was exemplified practically by philosopher Willard O. Quine (1908–2000). Think of a linguist who overhears the word *Gavagai* from the mouth of a native informant when a rabbit is sighted scurrying through the bushes, Quine (pp. 102–129)^[15] suggests. The linguist cannot determine what the word refers to—“rabbit,” “undetached rabbit parts,” or “rabbit stage”—because all of these are senses associated with that word. The sense, therefore, will remain indeterminate unless it can be inferred from the context in which *Gavagai* occurs.

There is also another aspect of signification that merits mention here—definition. Definition is an analytical technique; it is a statement made about what something means consisting of words and other signs (for example, pictures). As useful as it is, definition leads inevitably to circularity. Take the dictionary definition of *cat* as “a small carnivorous mammal domesticated since early times as a catcher of rats and mice and as a pet and existing in several distinctive breeds and varieties.” The problem with this statement is its use of *mammal* to define *cat*. In effect, it has replaced the latter with the former. So, what is the meaning of *mammal*? A *mammal*, it states elsewhere, is “any of various warm-blooded vertebrate animals of the class Mammalia.” But this definition is hardly a viable solution. What is an *animal*? The dictionary defines *animal* as an *organism*, which it defines, in turn, as an individual form of *life*, which it then defines as the property that distinguishes living *organisms*. At that point the dictionary has gone into a referential loop, since it has employed an already-used concept, *organism*, to define *life*. This circular pattern surfaces in all domains of signification. It suggests that signs can never be understood in the absolute, only in relation to other signs.

In contemporary semiotics, the terms *denotation* and *connotation* are preferred to reference and sense. Consider, again, the word *cat*. The word elicits an image of a “creature with four legs, whiskers, retractile claws,” etc. This is its *denotative* meaning. It allows users of the sign to determine if something real or imaginary under

consideration is an exemplar of a “cat” or not. Denotative meaning thus divides the world or reference into yes-no domains—something is either a cat or it is not. The word *denotation*, incidentally, is derived from the compound Latin verb *de-noto* “to mark out, point out, specify, indicate.” The noun *nota* (“mark, sign, note”) itself derives from the verb *nosco* (“to come to know,” “to become acquainted with” and “to recognize”). All other meanings of the word *cat* are *connotative*—as can be seen in “He’s a real cool cat;” “She let the cat out of the bag;” and so on. These meanings are products of the historical associations forged between cats and socially significant concepts or processes. Connotation also encompasses emotional cues. Consider the word *yes*. In addition to being a sign of affirmation (denotative meaning), it can have various emotional senses (connotative meanings), depending on the tone of voice with which it is uttered. If one says it with a raised tone, as in a question, “Yes?” then it would convey doubt or incredulity. If articulated emphatically, “Yes!” then it would connote triumph, achievement, or victory.

Connotation is not an option, as some traditional philosophical and linguistic theories of meaning continue to sustain to this day; it is something we are inclined to extract at a *prima facie* level from a sign. The numbers 7 and 13 have specific denotative meanings—each digit stands for a specific quantity of things. But in our culture both invariably reverberate at the same time with connotative meanings such as “fortune,” “destiny,” “bad luck,” and so on. Abstract concepts, such as *motherhood*, *masculinity*, *friendship*, and *justice*, are particularly high in connotative content. In 1957, the psychologists Charles Osgood, G. J. Suci, and P. H. Tannenbaum^[16] showed this empirically by using a technique that they called the *semantic differential*, a technique consisting in asking a series of questions to subjects about a particular concept—*Is X good or bad? Should Y be weak or strong?* etc.—which they rate on seven-point scales. The ratings are collected and analyzed statistically in order to sift out any general pattern they might bear. Suppose that subjects are asked to rate the concept “ideal American president” in terms of the following scales: *Should the president be:* 1) *young or old?* 2) *practical or idealistic?* 3) *modern or traditional?* 4) *male or female?* and so on. A subject who feels that the president should be more “youngish” than “oldish” would place a mark toward the *young* end of the first scale; one who feels that a president should be “bland,” would place a mark toward the *bland* end of the *attractive-bland* scale; and so on. If a statistically significant sample of subjects rated the president in this way, we would get a “connotative profile” of the American presidency in terms of the culture-based variations in sense that it evokes. Research using the semantic differential has shown, for example, that connotation is invariably culture-specific—a concept such as *noise* turns out to be a highly emotional one for the Japanese, who rate it consistently at the ends of the scales presented to them; whereas it is a fairly neutral concept for Americans, who tend to

rate it on average in the mid-ranges of the same scales. Connotation is not, therefore, open-ended; it is constrained by a series of culture-specific factors. Without such constraints, our signification systems would be virtually unusable.

Although it has a long history behind it in philosophy, the distinction between denotation and connotation, as we understand it today, was used for the first time by the American linguist Leonard Bloomfield in his seminal 1933 book called *Language*. This distinction was elaborated upon a little later by Danish linguist Louis Hjelmslev^[17] and French semiotician in various works.

Semiotics also makes an important distinction between the terms *image* and *concept*. The former is the mental picture of a referent that is evoked when a sign is used; the latter is the culture-specific interpretation that is assigned to that picture. There are two types of concepts—concrete and abstract. The former is the concept that is formed when a sign refers to something that can be seen, heard, smelled, touched, tasted—that is, observed in some direct sensory way. The latter is the concept formed when the sign is to something that cannot be perceived in such a direct sensory fashion. A “cat” constitutes a concrete concept because the existence of a real cat in the physical world can be perceived and thus easily pictured in the mind. On the other hand, “love” is an abstract concept because, although it can be experienced emotionally, it cannot be observed directly—that is, the emotion itself cannot be separated from the behaviors, states of mind it produces. The mental image that it evokes is, thus, abstract (imaginary).

The distinction between concrete and abstract concepts is only a general one. In actual fact, there are degrees and layers of concreteness and abstraction. At the highest level, called the *superordinate* level by psychologists, concepts are considered to have a highly general classificatory (abstract) function. So, for example, in the dictionary definition of *cat* (above), the related concept of *mammal* would be viewed as a superordinate concept, because it refers to the general category of animals to which a cat is perceived as belonging. Then, there is the *basic* or *prototypical* level, which is where the word *cat* itself would fit in. This is the level where basic types of mammals are classified—cats, dogs, goats, hogs, horses, etc. The third level, called the *subordinate* level, is where more detailed ways of referring to something occur. There are, in fact, many types (breeds) of cat—*Siamese*, *Persian*, *Abyssinian*, *Korat*, etc.—which allow us to refer to culturally meaningful differences in detail. However, such notions as levels and hierarchies in concept-formation are problematic, as Umberto Eco pointed out in his 1984 book *Semiotics and the Philosophy of Language*. The main difficulty, he suggested, is that decisions as to where a concept belongs in a hierarchy invariably end up being a matter of subjective choice.

Ultimately, the meanings that signs capture allow people to recognize certain patterns in the world over and over

again. Signs are thus closely tied to social needs and aspirations, creating an ongoing dialogue between people that would otherwise never come into being—a fact emphasized by many semioticians, especially the Russian theorist Mikhail Bakhtin (1895–1975). Bakhtin went so far as to claim that signs gain meaning only as they are exchanged by people in actual social dialogue or discourse.^[18] In effect, he maintained that all human meaning is constructed dialogically (socially).

SIGNS

Semiotic inquiry is guided by two fundamental models of the sign—known as Saussurean and Peircean. Saussure saw the sign as a binary form—a structure with two components, namely a physical part, such as the sounds that make up the word *cat*, called the *signifier*, and the concept that the sign elicits, called the *signified* (p. 101).^[1] Saussure claimed, moreover, that there is no necessary psychological motivation or reason for creating the word *cat* other than the social need to do so. Any other signifier would have done the job just as effectively. This is why his model of the sign is also called “arbitrary.” Peirce put forward a “triadic” model of the sign—a structure consisting of the actual physical sign-form, called the *representamen*, the thing to which it refers, termed the *object*, and the meanings that it elicits in real-world situations, called the *interpretant* (Peirce 1931–1958: Volume 2, 247–248, 307). The interpretant constitutes itself a “derived” sign, because it entails the further production of meanings (senses) arising from the context in which a sign is used. In our culture, a *cat* is considered to be a domestic companion, among other things; in others it is viewed primarily as a sacred animal; and in others still it is considered to be a source of food. Thus, while the sign refers to virtually the same mammal in different cultural contexts (no matter what name is used), its interpretant varies considerably.

Peirce also developed a comprehensive typology of signs, identifying 66 types in total. Newcomers to semiotics often react with perplexity to his typology, which consists of seemingly obscure and unfathomable notions such as *qualisigns*, *sinsigns*, and *legisigns*. But his terminological style is actually quite straightforward. As its name implies, a *qualisign* is a sign that draws attention to some *quality* of its referent (the object it represents). In language, an adjective is a *qualisign* since it draws attention to the qualities (color, shape, size, etc.) of things. In other sign systems, *qualisigns* include colors (painting), harmonies and tones (music), etc. A *sinsign* is a *representamen* that *singles out* a particular object—a pointing finger and the words *here* and *there* are examples of *sinsigns*. A *legisign* is a form that designates something by convention (literally “by law”). *Legisigns* include various kinds of symbols and emblems such as those used on flags and

logos. Unlike Saussure, Peirce viewed sign-creation as originating in the perception of some property in an object. For this reason, he called the initial act of sign-construction a “firstness” event. Firstness is, more technically, a tendency to forge signs as simulations of objects (or other sign-forms for that matter). The outcome is a sign that resembles what it stands for in some way. Peirce called such a sign an *icon*. Portraits are icons of human faces (and what they mean); onomatopoeic words are icons of sounds made by certain objects or actions (*drip*, *bang*, etc.); and so on. The referents of icons can be figured out even by those who are not a part of the culture, if they are told how icons simulate, resemble, or substitute them. A “secondness” tendency in sign-creation consists in relating objects in some way. He called signs that result from this tendency *indexes*. The pointing finger is a basic example of an index. When we point to something, we are in fact relating it to our location as pointers. If it is close by we refer to it as *near* or *here*. If not, we refer to it as *far* or *there*. Finally, a “thirdness” tendency consists in creating signs in historically based or conventional ways. Peirce called signs that result from this tendency *symbols*. The cross figure used to stand for Christianity is a perfect example of a symbol. Although it represents the figure of a cross on which Christ was crucified iconically, it is interpreted historically and conventionally as a sign standing for the religion that was founded after Christ’s death.

Despite the obvious richness and breadth of Peircean sign theory, the Saussurean model continues to enjoy wide use among semioticians because it is a much more expedient one to apply, especially in the initial phases of analysis. Signifiers can easily be separated from contexts of occurrence and studied abstractly in relation to signifieds, albeit somewhat artificially. Peirce’s model, however, has proven to be a more insightful and all-encompassing one in the development of a comprehensive theory of meaning.

STRUCTURE, TEXT, AND CODE

In order to extract meaning from a form, one must be able to recognize it as a sign in the first place. This means that it must have *structure*. Specifically, a form is a sign if: 1) it is physically distinctive; and 2) it is constructed in a predictable or recurring way. The former is called, more specifically, *paradigmatic* and the latter *syntagmatic* aspects of sign-structure. What keeps the words *cat* and *rat* recognizably distinct? It is, of course, the initial sound. The phonic difference between *c* (= /k/) and *r* (= /r/) is, in fact, what allows us to recognize the two words as different signs. Paradigmatic structure is a feature of all types of signs, not just words. In music, a major and minor chord of the same key are perceivable as distinct on account of a half tone difference in the middle note of the chord; the left and right shoes of a pair are identifiable as different in

terms of the orientation of each shoe; raising the index and middle fingers in a vertical orientation can mean “victory,” “peace” (among other meanings), but aiming the same two fingers in a horizontal way at someone would be interpreted instead as a threat; and so on.

The words *cat* and *rat* are legitimate signs, not only because they are recognizable as different in a specific way, but also because the combination of sounds with which they are constructed is consistent with English syllable structure. On the other hand, *pfat* would not be recognized as a legitimate word in English because it violates an aspect of such structure—English words cannot start with the cluster *pf*. Syllable structure is an example of *syntagmatic* structure. Syntagmatic structure too is found in the composition of all kinds of signs. In music, for instance, a melody is recognizable as such only if the notes follow each other in a certain way (e.g., according to the rules of harmony); two shoes are considered to form a pair if they are of the same size, style, and color; and so on.

The sign can take any form, or “size,” we desire to give it—it can be something “small,” such as a word or two fingers raised in a vertical way; or it can be something much “larger,” such as a mathematical equation or a narrative. If we ask a mathematician what $c^2 = a^2 + b^2$ means, he or she would instantly recognize it as an equation (the signifier) standing for the Pythagorean theorem (the signified). If we ask someone who has just read a novel (the signifier), what he or she got out of it, we would receive an answer that reveals a perception of the novel as a form containing a hidden message or purpose (the signified).

In contemporary semiotic theory, such “larger signs” are called *texts*, rather than simply signs; and the meanings they encode are called *messages*. The term text embraces such things as conversations, letters, speeches, poems, myths, novels, television programs, paintings, scientific theories, musical compositions, and so on. Texts are composite structures (signs made up of smaller signs), but they are still signs, that is, they are not interpreted in terms of their constituent parts, but holistically as single meaning-bearing structures. This is why when we ask someone what a novel means, he or she couches the answer in terms of the message he or she extracts from it, not in terms of the words it contains.

Texts are used primarily to carry out *representation*—defined as the use of signs (words, pictures, sounds, etc.) to relate, depict, portray, or reproduce something perceived, sensed, imagined, or felt in some textual form. As an example, consider the concept of *sex*. This is something that exists in the world as a biological and emotional phenomenon. Perceiving it as something meaningful, humans across cultures have represented sex in various textual forms throughout their history. For example, in our culture, common textual representations of *sex* include: 1) a photograph of two people engaged in kissing

romantically; 2) a poem describing the various emotional aspects of sex; or 3) an erotic movie depicting the more physical aspects of sex. Each of these constitutes a specific kind of textual form. The meanings (messages) that each captures are built into it not only by its maker, but also by certain preexisting notions relative to the culture in which it was made. Representations of sex in, say, Paris are thus going to be different from representations of it Bombay or San Francisco. Moreover, the type of text or medium used to portray the object of sex also shapes its interpretation. Photographs can show fairly limited views of sexual activities, whereas movies can provide much more graphic detail. Finally, the ways in which people living in Paris, Bombay, or San Francisco will derive meaning from the representations of sex will vary widely. This is because they have become accustomed in their specific cultures to different perceptions of what sex is.

Text-making implies knowledge of how signs cohere into systems—words, figures, digits, sounds, etc. To enter into a conversation, for example, one would need to know the language system involved. This provides the signs (words, tones, etc.) and specifies the relations that these bear to each other for the purpose of making verbal messages. The term used in semiotics to refer to such a system is *code*. Language, dress, music, and gesture are examples of codes. These can be defined, more formally, as systems of signs that have specific paradigmatic and syntagmatic properties and, thus, can be used over and over to encode and decode texts. There are many kinds of codes. For example, *intellectual codes* contain signs in them (numbers, words, symbols, etc.) that allow for representational activities of a logical, mathematical, scientific, or philosophical nature; *social codes* (dress, gender, food, space, etc.) contain sign-structures for making messages in socially appropriate ways and for regulating interpersonal activities. Food codes, for example, underlie how people interpret certain foods as signifiers of various rituals, meanings, etc. This is the reason why many Christians say grace before starting a meal together or Jews say special prayers before partaking of wine and bread.

Codes may also have a *contextual* function. Consider a discarded and damaged beer can. If one were to come across this item on a sidewalk on a city street, one would no doubt view it as a piece of garbage or rubbish. But if one saw the very same object on a pedestal, displayed in an art gallery, and given a title such as “Waste,” then one would be inclined to interpret it in a vastly different way. One would, in fact, interpret it as an artistic text, decrying a throw-away or materialistic society. Clearly, the can’s physical context of occurrence and social frame of reference—its location on a sidewalk versus its display in an art gallery—will determine how we will interpret it. The art gallery is, in effect, a social code. This is why we interpret anything that is put on display within it as “art,” rather than as something else (pp. 34–39).^[19]

OPPOSITION

To identify forms as meaning-bearing structures, the so-called technique of *opposition* was used by Saussure in the *Cours*, where he called it *différence*. As we saw above, by opposing the word *cat* to the word *rat* we will be able to establish that the consonants /k/ and /r/ are meaning-signaling phonic cues in English. As a technique, opposition was further elaborated by a number of linguists who congregated in Prague in the early 1920s. The linguist Trubetzkoy,^[20,21] for example, called word pairs such as *cat-versus-rat* that differed by only one sound in the same position *minimal pairs*. Opposition was also used by the same linguists to examine higher-level semantic *différences* such as synonymy (*big-large*), antonymy (*big-little*), taxonomy (*rose-flower*), part-whole relations (*handle-cup*), and so on. As C. K. Ogden (p. 18),^[22] an early promoter of opposition theory claimed, “the theory of opposition offers a new method of approach not only in the case of all those words which can best be defined in terms of their opposites, or of the oppositional scale on which they appear, but also to *any* word.” In the 1930s and 1940s, semioticians started noticing that oppositional structure was not confined to language. It cropped up in the analysis of nonverbal systems and codes as well. For example, in the integer system of numbers, oppositions include *positive-versus-negative*, *odd-versus-even*, and *prime-versus-composite*; in music, basic oppositions include *major-versus-minor* and *consonant-versus-dissonant*; and so on.

The Prague School linguists also argued that there were levels or orders of oppositions. In arithmetic, for example, the *addition-versus-subtraction* opposition is the basic one while the *multiplication-versus-division* opposition is a derived one—since multiplication is repeated addition and division repeated subtraction. The *addition-versus-subtraction* opposition is thus a first-order opposition and the derived *multiplication-versus-division* opposition a second-order opposition. In an analogous vein, French semiotician Algirdas J. Greimas later introduced the notion of the “semiotic square” to connect sets of oppositions.^[9] Given a sign (for example, *rich*), Greimas claimed that we determine its overall meaning by opposing it to its contradictory (*not rich*), its contrary (*poor*), and its contradictory (*not poor*) in tandem. Also, as work with the semantic differential showed in the 1950s (mentioned above), there are also gradations within the binary oppositions themselves, which are due to culture-specific connotative processes. Anthropologist Claude Lévi-Strauss also entered the debate on opposition theory in the same decade by showing that pairs of oppositions often cohere into sets forming recognizable units. In analyzing kinship systems, Lévi-Strauss^[23] found that the elementary unit of kinship was made up of a set of four oppositions: *brother* vs. *sister*, *husband* vs. *wife*, *father* vs. *son*, and *mother’s brother* vs. *sister’s son*. Lévi-Strauss suspected that

similar sets characterized units in other cultural systems and, thus, that their study would provide fundamental insights into the overall nature of human social organization.

Although the idea goes right back to Aristotle, the cognitive importance of opposition was noticed by the psychologists Wilhelm Wundt (1832–1920) and Edward B. Titchener (1867–1927), who were the ones to term it *opposition*. Its use in semiotics and linguistics is due, as mentioned, to Saussure and the Prague School linguists.^[24–26] Since its introduction, the theory has often been criticized as being artificial and not really consistent with human psychology. However, already in the 1940s Jakobson^[27] argued that the notion could, actually, be used to explain the psychology of language development. He noted that sound oppositions that occur frequently are among the first ones learned by children. Nasal consonants—/n/ and /m/—exist in all languages; and they are also among the earliest sounds acquired by children. On the other hand, consonants pronounced near the back of the throat are relatively rare and, seemingly, are among the last sounds to be acquired by children. In other words, the theory of opposition predicts the sequence of phonemic acquisition in children.

Research on metaphor since the latter part of the 1970s^[28–31] has also serendipitously discovered that opposition theory has psychological validity. American linguist George Lakoff and philosopher Mark Johnson started the ball rolling by claiming that a simple linguistic metaphor such as “John is a gorilla” is really a token of something more general, namely, a conceptual metaphor that has the cognitive structure *people are animals*.^[29] This is why we can also say that *John* or *Mary* or whoever we want is a *gorilla*, *snake*, *pig*, *puppy*, and so on. Each specific linguistic metaphor (“John is a gorilla,” “Mary is a snake,” etc.) is not an isolated example of poetic fancy. It is an instantiation of a more general conceptual metaphor—*people are animals*. The question becomes: How are such concepts formed? They are formed through *image schemata*.^[32,33] The source for the *people are animals* conceptual metaphor seems to be an unconscious perception that human personalities and animal behaviors are linked in some way. In other words, it is the consequence of an ontological opposition: *humans-versus-animals*. This is yet another type of opposition—one in which the two poles are not contrasted (*night-versus-day*), but equated. This suggests that oppositional structure operates in a noncontrastive way at the level of figurative meaning.

POSTSTRUCTURALISM

The most severe critiques of opposition theory started in the 1950s, revolving around the relative notion of *markedness*.^[34–37] In minimal pairs such as *night-versus-day*, the question becomes: Which of the two poles is the more

basic one (culturally or psychologically)? The more basic (or default) one is called the *unmarked* pole and the other the *marked* pole. In pairs such as *night-versus-day* it is easy to identify *day* as the unmarked form and *night* as its marked counterpart. This fact comes out in many signifying forms and representations. For example, we ask “How many days are left before your birthday?” not “How many nights are left before your birthday?” Now, consider the *male-versus-female* opposition. In this case, the choice of one or the other as the unmarked pole is problematic and culture-specific. In patrilineal societies the unmarked form is *male*; but in matrilineal ones, as the Iroquois one,^[38] it is *female*. This difference in markedness has social consequences. In English, gendered terms like *chairman*, *spokesman*, etc. were often cited in the not-too-distant past as examples of how the English language predisposed its users to view certain social roles in strict gender terms, with the masculine gender being considered the unmarked one. Feminist critics maintained (correctly) that English grammar and vocabulary were organized from the perspective of those at the center of the society—the men.

Some scholars, especially Michel Foucault (1926–1984) and Jacques Derrida (1930–2004), started to see opposition theory itself as flawed and the unwitting source of social inequalities.^[39,40] Their refutations of this central structuralist technique led to the movement known as *poststructuralism*. To Derrida, the oppositions identified by linguists and semioticians were the result of an endemic logocentrism in western culture, not the result of some tendency present in the human brain. Saussure had emphasized that every sign is understandable in terms of its difference from other signs. In contrast to Saussure’s idea of *différence*, Derrida invented the word *différance* (spelled with an “a,” but pronounced in the same way), to intentionally radicalize Saussurean theory. With this term Derrida aimed to show that Saussure’s so-called discoveries were unwitting biased ones, given the atmosphere of scientific logocentrism in which he operated, and which veiled from him the logic of *différance*—namely that a science of language cannot succeed because it must unfold through language and thus partake of the slippage (as he called it) it discovers.

Derrida argued that all sign systems are self-referential—signs refer to other signs, which refer to still other signs, and so on ad infinitum. Thus, what appears to be stable and logical to the language scientist turns out to be illogical and paradoxical. Many semioticians and linguists have severely criticized post structuralism. It has nevertheless had a profound impact on many fields of knowledge, not just semiotics and linguistics. So what do post structuralists analyze and how does post structuralism differ from traditional structuralist practice? From many points of view, post structuralism is really nothing more than structuralism expanded to include a few radical ideas. One of these is clearly logocentrism—the view that all human knowledge is constructed by linguistic categories.

Because written language is the fundamental condition of knowledge-producing enterprises, such as science and philosophy, these end up reflecting nothing more than the writing practices used to articulate them. In hindsight, there was nothing particularly radical in this poststructuralist position. Already in the 1920s, Jakobson and Trubetzkoy started probing the “relativity” of language oppositions in the light of their social and psychological functions. Basing their ideas in part on the work of German psychologist Karl Bühler (1879–1963), the Prague School linguists posited that language categories mirrored social ones. The goal of a true semiotic science, they claimed, was to investigate the isomorphism that manifested itself between sign and social systems.

In the end, the poststructuralist movement was, arguably, nothing more than a reaction to Saussureanism in its most radical forms. It was (and continues to be) of little or no interest to semioticians who work primarily within the framework of Peircean sign theory, which emphasizes the interpretive component in sign study.

SEMIOTICS AND INFORMATION

Above all else, semiotics is useful as an interdisciplinary tool. It has also been applied fruitfully to the information sciences see, for instance Brier^[41] who gives an in-depth analysis of the “semiotics of information,” as it may be called. Information can be defined simply as data that can be received by humans, animals, or machines. In various scientific theoretical frameworks, it is considered as something mathematically probabilistic—a ringing alarm signal, for instance, is said to carry more information than one that is silent, because the silent state is the “expected state” of the alarm system, while the former is its “alerting state” and thus carries maximum information about the referential domain the system is designed to encode. As is well known, the individual who developed the mathematical theory of information was the American telecommunications engineer Claude Shannon (1916–2001), who showed, essentially, that the information contained in a signal is inversely proportional to its probability—that is to say, the more probable a signal, the less information “load” it carries with it; the less likely, the more.

Shannon’s model essentially depicts information transfer as a one-way process dependent on probability factors, that is, on the degree to which a message is to be expected or not in a given situation. It is appropriately called the “bull’s-eye model” because a sender of information is defined as someone or something aiming a message at a receiver of the information as if in a bull’s-eye target range. Shannon also introduced several key terms into the general study of information and communication: channel, noise, redundancy, and feedback. His model has, over the years, been useful in providing a terminology for describing aspects of communication and information systems,

but it tells us nothing about how messages and meanings shape and ultimately determine the nature of human communication and knowledge-making events. The semiotician would ask: how does information become knowledge? The answer is that it is encoded in the form of signs and codes. Each code thus presents information according to its own particular kind of structure. This allows humans to interpret the world of objects and events in a specific way and, subsequently, to respond to it in specific ways. The innate semiotic modeling system of a species routinely converts the external world of information (sensory, affective, etc.) into internal states of knowing and remembering that are unique to the species. Access to those states without possessing the same mental modeling system is never going to be complete. To study modeling systems, a branch of semiotics, known as *biosemiotics*, has become dominant within the entire field.^[42,43] Essentially, biosemiotics attempts to determine how each species converts information into self-serving knowledge through its innate system of semiosis—the ability to produce and use signs.

In the human world, however, information is assigned meaning, since it is meaningless in itself. This is accomplished by connecting it to some code or system of interpretation (language, science, mathematics, music, etc.), so that it can be utilized for some purpose. Information is useless without a semiotic key for interpreting and using it. It is, as its etymology suggests—from Latin *information* “a sketch, an outline”—nothing more than encoded *form*. Deriving *content* from this form requires knowledge of how it has been represented and how it has been used. Not only, but the relation between the representation of information and the information itself is so intrinsic that it is often impossible to differentiate between the two.

CONCLUDING REMARKS

Semiotics is, in a fundamental way, a study of how humans shape raw information into knowledge categories through sign-creation. We create signs in order to select from the raw flux of information that bombards our senses what we wish to remember from it. Although we create new signs to help us gain new knowledge and modify previous knowledge—that is what artists, scientists, writers, for instance, are always doing—by and large, we literally let our culture “do the understanding” for us. We are born into an already-fixed system of sign-use, called the *semiosphere* by the late Estonian semiotician Juri Lotman (1922–1993)—that will largely determine how we come to view the world around us.^[44] Moreover, the semiosphere, like the biosphere, regulates human behavior and shapes evolution. But although they can do little about the biosphere, humans have the ability to reshape the semiosphere any time they want. This is why cultures are both restrictive and liberating. They are restrictive in that they impose upon individuals reared in them an already-fixed system

of signification. But cultures are also liberating because paradoxically they provide the textual resources by which individuals can seek new meanings on their own. The artistic, religious, scientific, and philosophical texts to which individuals are exposed in social contexts, moreover, open up the mind, stimulate creativity, and engender freedom of thought. As a result, human beings tend to become restless for new meanings, new messages.

Senegal: Libraries, Archives, and Museums

Bernard Dione

School of Librarianship, Archivists Information Science (EBAD), Cheikh Anta Diop University, Dakar, Senegal

Dieyi Diouf

Central Library, Cheikh Anta Diop University of Dakar, Dakar, Senegal

Abstract

The authors provide a historical overview of Senegalese libraries, archives, and museums, outlining patterns and trends from the French colonial period to the present. Topics covered include: national, public, academic, special, and school libraries as well as the National Archives of Senegal, regional archives, and major museums. The legal framework for these institutions is detailed. However, although comprehensive and well thought out library legislation was enacted in the 1970s, realization of the plans for a national library, and for a network of public libraries has been stalled due to the lack of funding. The authors also discuss the role of professional associations and the development and professional education in these three fields.

INTRODUCTION

Senegal is the westernmost country on the African continent and is located in the Sahel Region. It is bordered by the Atlantic Ocean to the West, Mauritania to the North, Mali to the East, and Guinea and Guinea Bissau to the South. Senegal almost completely surrounds the Gambia, which forms a virtual enclave within its borders. During the nineteenth century Senegal was a bridge-head for France's conquest of its African colonial empire and the coastal cities of Senegal were the first French colonial outposts in west Africa. In 1902, Dakar became the capital colonial French West Africa (Afrique Occidentale Française, or the AOF) which consisted of several additional colonies and territories. Citizens of Senegal were the first Africans to gain French citizenship rights. The French expansionism and the spread of Islam occurred simultaneously during the late eighteenth and nineteenth centuries have shaped modern Senegal (Fig. 1).^[1]

The official language of government is French, but the country is characterized by cultural and linguistic diversity, with Wolof, Pulaar, Jola, Mandinka, and Serer also common languages. Senegal is a predominantly Muslim country with many Koranic schools, so Arabic is also an important language for reading and writing. The country's area is around 195,190 sq. km. and the Senegalese population was estimated at around 12,853,259 (in July 2008). The country's total literacy rate was about 39.3% (51.1% for males and 29.2% for females).^[2]

LIBRARY AND INFORMATION PROFESSIONS

Systems and Services

A brief overview of legislation

In the early 1970s, the government of Senegal drew up a comprehensive legal framework for the promotion of reading and libraries and this legislation established the infrastructures for several important policy initiatives. By Act No. 71-58 and Act No. 71-53, the exemption of taxes on importation of books was adopted in 1971. By Decree No. 72-1316, a Conseil Supérieur du Livre (High Book Council) was established. And 1 year later many institutions were created in order to promote literacy and a reading culture; these included:

- « Les Nouvelles Editions Africaines (NEA) » (New African Editions),
- The « Société de Presse, d'Édition et de Publicité (SONAPRESS) » (Society of Press, Publishing, and Publicity),
- « Les Nouvelles Imprimeries du Sénégal (NIS) » (New Printing Presses of Senegal),
- a the « Bureau Sénégalais du Droit d'auteur (BSDA) » (Senegalese Bureau of Author's Rights).

Act No. 73-52, dated December 4, 1973 was passed to protect literary and artistic rights. Then in 1980, two legal acts aiming to help the book sector were passed: Act No.

Fig. 1 Map of Senegal.

Source: CIA world factbook. <https://www.cia.gov/library/publications/the-world-factbook/geos/sg.html>

80-37 and Act No. 80-79 dated August 25, 1980. These acts instituted a value added tax exemption for periodicals and newspapers, and for the importation and purchasing of local raw materials used in the manufacturing of books and newspapers in Senegal.

This legal framework for the promotion of literacy and a reading culture was completed in 1976, by the legislation on libraries. During this period, important statements of principle were formulated by the government for the best applications of laws favoring open access to information for all.

The library profession in Senegal was given a legal existence in 1969 by Decree No. 69-257, dated March 17, 1969 concerning the status of civil servants who work in libraries and archives. Between 1975 and 1977 much of the Senegalese legislation concerning library and documentation services were signed into law by the first Senegalese president, the poet and French academician Leopold Sédar Senghor (1906–2001).^[3] The years 1976–1977 represented an important turning point when seven major legal documents were promulgated:

- Act No. 76-24, dated April 9, 1976 organizing the national library network,
- Act No. 76-30, dated April 9, 1976 establishing legal deposit,
- Decree No. 76-493 dated May 5, 1976 creating and organizing the National Library,
- Decree No. 76-494 dated May 5, 1976 creating a public lending library,

- Decree No. 76-1021 dated October 14, 1976 establishing the Directorate of Public Libraries (Direction des Bibliothèques publiques) within the Ministry of Culture (Ministère de la Culture).
- April 6th, 1977, a National Center of Scientific and Technical Documentation [Centre National de Documentation Scientifique et Technique (CNDST)] was created by Decree No. 77-272, and
- Decree No. 69-257 was abrogated and replaced by the Decree No. 77-890, dated October 12, 1977 concerning in particular the status of civil servants in Archives and libraries.

All this legal texts were the results of the work of a committee established in 1973.^[4]

Around the same time, the Directorate of Public Libraries (Direction des Bibliothèques publiques) was merged with the Directorate of Arts and Letters (Direction des Arts et des Lettres) to become the Directorate of Arts, Letters, and Libraries (Direction des Arts des Lettres et des Bibliothèques). Raphael A. Ndiaye was appointed to implement these new policies. Unfortunately from the late 1970s to the present, Senegalese libraries have suffered from a lack of funding due to economic structural adjustment. Most of the librarians employed in the public library network left for other positions, leaving these small libraries to be run by nonlibrarians. This situation still persists.

The legal framework remained stable until 2000 when, by Decree 2000-947, a Directorate of Books and Reading (Direction du livre et de la lecture) was created within the Senegalese Ministry of Culture and, at the same time, a professional librarian was appointed to manage the Directorate. Two years later, on April 3rd, 2002, Act No. 2002-17, restoring the National Library was passed and another act on the promotion of books and reading is under preparation.

NATIONAL LIBRARY AND INFORMATION SERVICES

The National Library of Senegal exists only as a legal entity. The Senegalese National Library was created by Decree No. 76-493, dated May 5, 1976, but without facilities, budget, and staff. Three years later, the National Library was made part of the National Archives of Senegal (by Letter No. 7820/PM/SGG/CI, dated October 5, 1979). The autonomy of this institution has been restored legally by Act No. 2002-17, dated April 3, 2002.

Previously, in 1996, then President Abdou Diouf decided to include a project to build a National Library among the priorities of his government. A national task force was named to work on the project, and a professional librarian was appointed to manage it. The National Library project was chaired by the head of the Directorate of Books and Reading in the Ministry of Culture. Three

librarians, an assistant-librarian, a documentalist, and a computer scientist were also recruited for the project and funds were allocated for the constitution of the initial collection of the institution. The construction of the building of the National Library was begun in 1999, but the work was stopped by Abdoulaye Wade, the President of Senegal who was elected in 2000. The latter has decided to develop a new project and move it on another site.

To complete its information policy, the Senegalese Government, following the recommendations of the Conference of Ministers responsible for Application of Science and Technology to the Socioeconomic Establishment of Africa (CASTAFRICA meeting held in Dakar in 1974) decided to create a National Scientific and Documentation Center (CNDST). The decision was taken by the Council of Ministers on April 14th, 1975. The United Nations Development Programme and UNESCO were to help Senegal create this institution, and the CNDST was established by Decree No. 77-272, dated April 6, 1997. The objectives of this institution are to coordinate all the research activities of information and documentation services that constitute the links of the National Scientific and Technical Information Network [Réseau National de l'Information Scientifique et Technique—RNIST]), and to promote all actions of common interest that that could serve to strengthen the scientific and technical information services. In recent years, the CNDST has not really been visible in the information and documentation environment. The Scientific and Research Department even attempted to suppress the CNDST in 2005.

Academic and Research Libraries

Higher education in the former French West Africa was gradually put into place during the colonial period. The first stage of the process began in 1916 with the creation of the Jules Carde African School of Medicine and Pharmacy in Dakar (l'Ecole Africaine de Médecine et de Pharmacie Jules Carde de Dakar). Two decades later, in 1938 by the government of French West Africa created the French Institute for Black Africa [l'Institut Français d'Afrique Noire (IFAN)], which specialized in African research. The first director of IFAN was versatile young scientist named Théodore Monod (1902–2000). Monod laid the foundations for scientific research in French West Africa and saw to the establishment of the first research library in the region. During his 26 years as director of IFAN, Monod made it a priority to develop a good library collection, and by 1949 the size of the original collection had tripled.

Following World War II plans were made to extend higher education to Francophone countries, and Dakar was selected as the site for an inter-African program. In 1949, an undergraduate education program in chemistry/biology was opened. Finally, the Dakar Institute of Higher Education was created, which officially became the

University of Dakar on February 24, 1957, then Cheikh Anta Diop University in Dakar [l'Université Cheikh Anta Diop de Dakar (UCAD)] on March 30, 1987. The Gaston Berger University in Saint-Louis (L'Université Gaston Berger de Saint-Louis du Sénégal), whose cornerstone was laid in 1974 by President Senghor, did not open its doors until 1990. The number of universities in Senegal was recently enlarged by the creation of the University of Thiès (l'Université de Thiès) in 2005, and Regional University Centers in Bambey and Ziguinchor in 2007.

The first collections of the current central library of the University Cheikh Anta Diop date from the creation of the African School of Medicine and Pharmacy. Therefore, the library of Cheikh Anta Diop University is the oldest and the most important university library in Francophone African countries south of the Sahara.

The central university library in Dakar is at the hub of a system of Cheikh Anta Diop University libraries. This network (officially established by Decree No. 95-197 of February 21, 1995) brings together all the libraries falling under the authority of the university; this includes a central library, 15 libraries of the Faculties (Schools), institutes or departments, and a photography collection. The central library of Cheikh Anta Diop University offers study spaces, modern technology and services (OPAC, Internet connection, WI-FI, etc.), and an encyclopedic collection of about 500,000 documents in all media. It also offers online access to digital collections.

The second largest university library system is found at the Gaston Berger University in Saint-Louis. This system offers a collection of about 70,000 items in the central library and 40,000 in the libraries of the training and research units (unités de formation et de recherche).

The recently created Universities of Ziguinchor and of Bambey have already set up university libraries and recruited librarians to manage them. Likewise, the Senegalese campus of Suffolk University offers information services. One can classify in this same category the library of the African Center for Post-Graduate Management Studies (Centre Africain d'Études Supérieures en Gestion — CESAG), a specialized management school.

All of these higher education libraries have joined together in the Consortium of Higher Education Libraries [Consortium des Bibliothèques de l'Enseignement Supérieur (COBES)]. University libraries constitute the most dynamic part of the library sector in Senegal. The university libraries in Dakar and in Saint-Louis, have at their disposal buildings and equipment that conform to international standards and they have integrated information technology into the service that they offer. Furthermore, they are managed by professionally qualified personnel.

Public Libraries

In 1976, the Senegalese government decided to create and organize a national public library network (by Decree No.

76-29, dated April 9, 1976). This legal framework was complemented by a second decree (Decree No. 76-1021, dated October 14, 1976) that created an administrative department, the Office for Public Libraries and by Act 76-30, dated April 9 establishing the Legal Deposit. The national public library network was a very ambitious project that included plans to create a public central library in the capital city Dakar, public regional libraries, public departmental libraries, district libraries, and rural libraries. But, this ambitious network remains to be built. In fact, the national library network, as it was initially conceived, was confined to 10 regional libraries integrated into Regional Cultural Centers and about 10 other municipal libraries integrated into the Departmental Centers of Physical Education and Sports (Centres Départementaux Education Physiques et Sportives). None of these libraries have equipment, separate facilities or professional staff and as a result they are unable to offer adequate library services. The collections are constituted by donations. The International Agency for Francophonie (Agence Internationale de la Francophonie) has established 16 Centers for Reading and Cultural Events [Centres de Lecture et d'Animation Culturelle (CLAC)] in two Senegalese regions. The first network installed in Thies region included seven of these centers; the second one in Kolda had nine centers. The Islamic Education, Scientific and Cultural Organization (ISESCO) has also established another network of 10 ISESCO CLAC for Arabic readers.

Beginning in 1990, eight libraries were created by the municipal authorities in Dakar and the city has plans to establish a network of 18 libraries. The total size of the collections of each of these small libraries is around 2000 books; 80% of the materials in these collections were donated by Canada. The remainder comes from a donation by the Franco-Senegal Alliance (Alliance Franco-Sénégalaise) and acquisitions made by the municipality.^[5] Many other libraries have been set up by private associations. The Alliance Franco-Sénégalaise has established a network of five libraries in Dakar, Saint-Louis, Tambacounda, Ziguinchor, and Kaolack. In addition, libraries have been set up other agencies and organizations headquartered overseas (for example Service de Coopération et d'Action Culturel de l'Ambassade de France, CAURIS, AFVP, Aide & Action, etc.). Local groups such as NGOs sports and cultural organizations, etc. have contributed to creating other libraries around the country.^[5] In addition there are several libraries established by foreign cultural centers (Goethe Institute, British Institute, etc.).

As in the past, most of the public libraries services are located in the capital city Dakar, which is also the major commercial and cultural center of the country. Of the 83 public libraries listed by the Senegalese Library Association, Association Sénégalaise des Bibliothécaires, Archivistes et Documentalistes (ASBAD), about 43 (52%) are

in Dakar. The list of all public library services is published on the Web site of the Minister of Culture (Ministère de la culture). http://www.culture.gouv.sn/article.php3?id_article=324/

School Libraries

Although they are an indispensable tool of education, school libraries still remain one of the weak links in the national network of reading resources. The absence of a legal framework clearly organizing school libraries seems to be recognized as a major obstacle to the development of school libraries in Senegal. Initiatives aimed at addressing this sector have been taken within the framework of two programs which are the Partnership Program for Effectiveness of Senegalese Schools (le Programme de Partenariat pour l'Efficacité de l'Ecole Sénégalaise) that concerns elementary schools and the Quality Education for All Program (le Programme Education de Qualité pour Tous) financed by the World Bank.^[6]

Despite the efforts agreed to by aid associations for the development of education, such as Libraries, Reading, and Development (Bibliothèque, Lecture et Développement (BLD)), the situation on the ground still remains difficult. A 1991 study about libraries of public establishments in the Dakar Region found that facilities housing libraries were often reduced to one cramped room (7 × 5 m) serving both as the office of the librarian, the reading room, and the book stacks. As for the collections, these are often made up solely of textbooks or assigned novels that the students borrow at the beginning and return at the end of the school year.^[6]

Special Libraries

Special libraries are more numerous but also more difficult to study. They are set up by specialized organizations and are not always accessible to the public. The specialized institutions and affiliated organizations of the United Nations (UNICEF, BIT, UNESCO-BREDA, World Bank, CINU) located in Dakar often have a library or a library and information service that one can research. Also, national, regional, or international research centers located in Senegal often set up a library. One can cite many examples of such research centers:

- The Senegalese Institute of Agricultural Research [l'Institut Sénégalais de Recherche Agricole (ISRA)],
- the Oceanographic Research and Documentation Center of Thiaroye [Centre de recherche et de Documentation Océanographique de Thiaroye (CRDOT)],
- the Institute of Food Technology [l'Institut de Technologie Alimentaire (ITA)],
- the Ecological Monitoring Center (le Centre de Suivi Ecologique), and

- the administrative, legal and historical library of the Directorate of the National Archives.
- The library of the Center for Research and Documentation in Saint-Louis (Centre de Recherche et de Documentation de Saint-Louis) comprises about 32,000 volumes;^[7]
- The Council for Social Science Research in Africa (le Conseil pour la Recherche en Sciences Sociales en Afrique (CODESRIA)) offers a library and documentation center specializing in social sciences; and
- The Institute for Development Research [l'Institut de Recherche pour le Développement (IRD)] offers quality information services.

Finally, one could mention among special libraries and information services the libraries and information services of public administration. The Office of the President of the Republic, certain ministries, the Court of Cassation (highest civil court), and the la Cour des Comptes (a quasi-governmental organization that audits government accounts, assesses management of public agencies and advises the government), each have a library and an information service. Some of these services are managed by professional librarians.

Digital Library Collections and Services

A certain number of the projects offered by digital libraries have been developed in higher education and at the level of research centers. Academic and research librarians work more and more on projects such as Cyberdocs and SIST (Système d'Information Scientifique et Technique = Scientific and Technical Information System). Cyberdocs-UCAD is a platform developed by the central library of Cheikh Anta Diop University on the Cyberthèses (Digital Theses) platform. Cyberdocs-UCAD allows for the electronic processing and diffusion of theses and dissertations produced in the faculties (schools) and institutes attached to the university, whose authors have voluntarily deposited an electronic copy. It also permits placing online documents other than theses and dissertations. Its objective is to increase the value of the work of students and researchers, maximize the visibility of the contents, facilitate access to this information, and freely share the results of the research products of UCAD. A cooperative project of the French Foreign Ministry, SIST is aimed at making African research more easily available and thus promoting African expertise and putting the science in the service of development. It offers to researchers and to information professionals in 12 countries a platform for information, communication, and collaborative work. Since 2006 databases, Web sites, Senegalese bibliographic catalogs can be consulted through SIST Sénégal.

EDUCATION FOR LIBRARY AND INFORMATION SCIENCE

The Ecole des Bibliothécaires, Archivistes et Documentalistes (EBAD), http://www.ebad.ucad.sn/acces_dedies/etudiants/info_generales/historique.htm/ or the Senegalese School of Library, Archival and Information Studies is one of the oldest LIS education programs in Francophone Africa. It was created on March 28, 1962 as a French-speaking Regional Center for Library Training and inaugurated on December 4, 1963.^[8,9] The first course began one month before its inauguration, on November 4, 1963 with 20 students: six from Senegal, two from Cameroon, one from Congo Brazzaville, two from Côte d'Ivoire (Ivory Coast), one from Dahomey (currently Benin), one from Guinea, one from Haute-Volta (Upper Volta, currently Burkina Faso), two from Madagascar, one from Mali, one from Chad, and two from Togo. The school still kept this regional orientation when it became the EBAD by Decree No. 67-1235 dated November 15, 1967 and became an Institute incorporated at Cheikh Anta Diop University. Initially, the training was focused on library science, but in 1971, a program on Archival studies was started and later a program on information science was established in 1975. Initially, EBAD awarded a diploma of proficiency in Librarianship, Archival studies, or Information science after a 2 year training period to holders of the Baccalaureate or an equivalent diploma. In 1982, another academic cycle (Final Honors) was created.

In 2007, Cheikh Anta Diop University decided to adopt the European curricular reform. To accomplish this, EBAD is transforming its degree programs into two cycles (Bachelor's and Masters). One of the objectives of this reform is to make its programs of study more compatible with programs in other countries; therefore with the help of The International Federation of Library Associations and Institutions (IFLA), Action for Development through Libraries Programme (ALP). EBAD, is working with newly established library schools of the Francophone countries to harmonize library curricula. Since 2000, EBAD has also been experimenting with distance learning and Internet courses through the project FORMation Continue en Information Informatisée en Réseau funded by the French agency for cooperation.

PROFESSIONAL ASSOCIATIONS

The existence of library associations in Senegal began when the International Association for the Development of Libraries in Africa was founded on September 13, 1957 in Saint-Louis, Senegal by E. K. Dadzie, and a small group of librarians working with other persons interested in promoting reading.^[10] In Dakar, on March 18, 1975 another group of professional librarians founded, a second professional association named Association Nationale des

Bibliothécaires, Archivistes et Documentalistes Sénégalais. These two associations merged on July 9, 1988 to constitute the ASBAD. The aims of ASBAD are to advance the development of libraries, archives, and documentation centers in Senegal and to study concerns common to information professionals in the country.

ARCHIVES AND ARCHIVAL SCIENCE

A Brief Overview of Legislation

Just 2 years after independence, the government of Senegal established a legal framework that regulates the management and accessibility of archives. In 1962, the government ordered that all judicial archives more than 50 years old, be deposited in the National Archives (Decree No. 62-0215 of May 28, 1962). That same year, the President of the Council, Mamadou Dia, ordered the deposit of official archives and publications (in Circular No. 52 of August 16, 1962). A few years later, in 1968, a decree was issued regulating the deposit in the National Archives of notarized deeds (titles) more than 50 years old (Decree No. 68-342 of March 29, 1968). The elaboration of legal texts organizing deposits in the archives also continued. Thus, on March 16, 1976 a Circular of the Prime Minister was issued to regulate the deposit of official archives and publications, (Circular No. 00025) and 2 years later on April 28, 1978, another Circular established procedures for pre-archival records management in ministries and public services. Since 1977, the Archives of Senegal been transformed by statute, attaining the status of a Directorate attached to the Secretary General of the Government in the Bureau of the Prime Minister. Several other official texts organizing the archives were put into place after that date.

National Archives and Services

The Archives of Senegal were created as a subunit (Service) of the Archives of French West African (l'Afrique Occidentale Française/A.O.F.), which were established by Governor General William Ponty on July 1, 1913. Claude Faure, the first professional archivist to work in the French African colonies was hired that year. Over the next five decades this collection was maintained by a professional archivist who also provided training to the first African archivists.^[9] Following the independence movement, these were the only archives in the French African colonies which were not taken back to France time of independence.

In 1958 when the government of Senegal, decided to transfer the capital from Saint-Louis to Dakar, the Archives of Senegal were transferred to the new capital where they were housed with the A.O.F. Archives.^[11] Jean François Maurel, Conservator of the A.O.F. Archives,

remained in Senegal and assumed management of both archives. In 1970, the Archives of Senegal were attached to the Secretary General of the Government, which was a part of the Bureau of the Prime Minister.

By the 1970s, the need to provide the Archives of Senegal with an appropriate building became more and more evident and in 1973 a decree was issued that authorized the construction of a "House of Archives" (Maison des Archives) (by Decree No. 73-080 of January 27, 1973). This decree was never carried out but was extended by Decree No. 75-461 of April 26, 1975. Unfortunately, the construction of this "House of Archives," like that of the building destined to house the National Library, has remained until now an unfinished project due to the decision by President Abdoulaye Wade to halt construction. There are plans that both the National Library and the National Archives should eventually be integrated into a project for a larger cultural complex.

After the departure of Jean-François Maurel, Saliou Mbaye, archivist paleographer, educated at the l'Ecole des Chartes in Paris was named director of the archives. The Archival Service of Senegal (Le Service des Archives du Sénégal) became the Directorate of Archives of Senegal (la Direction des Archives du Sénégal) by Decree No. 77-615 of July 21, 1977. Raising the status of the Archival Service of Senegal to that of a Directorate marks an important step in the history of the Senegales Archives (Law No. 81-02 relative to archives was passed on February 2, 1981). It was followed the same year by General Decree No. 81-430 of April 15, 1981, setting the conditions of organization and functioning of the Archives of Senegal and 2 years later by Decree No. 83-341 of April 1, 1983 devoted to access to documents in archives. This Law No. 81-02 of February 2, 1981 would not be repealed and replaced until 2006 by Law No. 2006-19 of June 30, 2006 relative to archives and administrative documents.

The Archives of Senegal occupy 12 km of shelf space separated into four principal sections according to the four principal collections (*fonds*):

- The Colonial Senegal collection (1816–1958);
- The A.O.F. collection (1895–1959);
- The collection of the Federation of Mali (1959–1960);
- The archives of independent Senegal (since 1958).

Article 7 of Law No. 81-02 of February 2, 1981 stipulates that "the Directorate of the Archives of Senegal is an organism of the State responsible for addressing all archival questions. It administers the national archives and the regional archives. It controls the archives of local collectivities." It is this disposition that established the Senegal collection to be subdivided into two parts: 1) central and regional archives, managed by the Directorate of the Archives and 2) archives of local collectivities placed under their control.

In principle, each Region should have at its disposal its own regional archival service. At the moment, five Regions are equipped with an archival service. These services are established within the services of the Regional Governors.

Since 1979, the Library of the Archives of Senegal houses the National Library Agency (l'Agence bibliothèque nationale) and receives the legal deposits instituted by Law No. 76-30 of April 9, 1976. The collection of the Library of the Archives is estimated at 27,300 works (books, reference works, microforms, and audiovisual documents and printed documents); this collection also includes 1515 titles of periodicals (both current and those which have ceased publication).

MUSEUMS AND MUSEOLOGY

Museums seem to have considerable difficulty in becoming integrated into Senegalese culture. According to an article published on June 8, 2006: "The Senegalese don't know the utility of museums or, in any case, only rarely visit them. In their place, it is rather tourists who flood into the museums after arriving by airplane."^[12]

The museum sector in Senegal experiences a certain number of difficulties of which the most important seem to be: the absence of a legal framework, the timid politics of the government, the absence of a professional training school specialized in this domain, inadequate funding and the lack of public interest.

The most important museums of the country are concentrated in three cities: Dakar, Goree and Saint-Louis, Senegal.

The IFAN Museum is indisputably the most important museum because of its age, its building, and the size and diversity of its collection. It is located in Dakar at Soweto Place, opposite the National Assembly of Senegal. The building which it occupies was allotted to the offices of IFAN by Governor General Jules Brévié (by Decision No. 1958 of August 20, 1936). Currently, the IFAN Museum offers a permanent exhibition on the theme of the arts and cultural traditions of West Africa, temporary and thematic exhibits using the collections of the Museum, and collections conserved in the storerooms.

Dakar also contains two museums that focus on the military and on customs officials. The more important of these is the Armed Forces Museum (le Musée des Forces Armées), created in July 1996, whose mission is to collect, conserve, and spread the national historic and cultural patrimony in the military domain. It also possesses a library of 1200 volumes destined to serve as the basis for the creation of a future Center for the study and military history of West Africa (Centre d'études et d'histoire militaire de l'Afrique de l'Ouest).

With four establishments, the island of Goree occupies a choice place in the museum sector. The most celebrated

is the House of Slaves of Goree (la Maison des esclaves de Gorée), which perpetuates the memory of one of the greatest human tragedies—slavery. The other museums of Goree are either the responsibility of IFAN or are private museums. The two museums administered by IFAN are the Historical Museum (le Musée Historique) that occupies the old Goree Fort and the Museum of the Sea (le Musée de la Mer). The Historical Museum of IFAN is devoted to the general history of Senegal from its origins to our days, illustrated by notable figures, whereas the Museum of the Sea concentrates on the sea, fishermen, and fishing tools.

Last but not least, there is the Henriette Bathily Museum (le Musée Henriette Bathily) devoted to women. The idea of creating a museum celebrating women dates from 1987, following a proposal by film maker Ousmane William Mbaye; however, the actual creation of the Henriette Bathily Museum did not occur until June 1994. Its establishment was justified, according to the words of its Director Annette Mbaye D'Erneville, by the fact that "(...) Women are the center of all communal life, for through their destiny is translated the destiny of an entire people, that her history (Herstory) sums up that of the whole society." This institution assigned itself the objective of making known the place and the role of Senegalese women in rituals and popular arts.^[12] In addition to an Art Gallery, where permanent, temporary, and thematic exhibits are displayed, the Henriette Bathily Museum offers high quality artisanal products made by the women of the museum, and a workshop that introduces women to painting, batik, weaving, and traditional embroidery techniques. The museum employs 12 people and has a garden café as well as a shop. However, the proximity to the House of Slaves, which was perceived to be an advantage has proven to be a real challenge for the Museum of Women. In effect, the latter has a great deal of difficulty in becoming visible.

Finally, in Saint-Louis there is the Museum of the Center for Research and Documentation of Senegal (le Musée du Centre de Recherche et de Documentation du Sénégal). This Museum, the former IFAN Center inaugurated in 1956, is now a part of the Ministry of National Education. It covers three themes: ecology, history, and ethnology.

CONCLUSION

During the first decades following independence, Senegal established and developed EBAD, a well-respected professional school with a regional mission to train librarians, archivists, and documentalists who serve in institutions throughout Francophone Africa. In addition, the Senegalese government enacted a well thought out legal framework for establishing a national library and extending library services throughout the country. Unfortunately, neither the library network nor the national library have

been realized due to difficult economic circumstances combined with the lack of strong political support.

Much work remains to be done in order for Senegal to be endowed with a library, archives, and museum network capable of collecting, processing, conserving, and making available the cultural and international patrimony of the country. Only university and research libraries have experienced a normal development, with collections and services that follow international standards and practices. And it is only the largest academic libraries and a few specialized research libraries (especially those in scientific fields) that have had enough financial support to employ modern information technology. Libraries of administrative services have often been treated as poor relatives while public libraries, school libraries, and all the other types of libraries have been sadly neglected and continue to suffer from a lack of adequate funding.

Given that political support is essential to the realization of these cultural institutions, it is of great concern that President Wade has halted work on the National Library and the House of Archives, declaring that neither of these were his projects. Faced with the situation of libraries, archives, and museums of Senegal, the words of the former President sound like a premonition when he noted in 1977 that:

(...) the most difficult, you know, is not to decide, by decree and even by law, the creation of libraries and their complements, which are archives and museums; the most difficult, in any case the most important, is to create them effectively and, especially, to make them function effectively.^[13]

Those professionals who are providing leadership for Senegalese libraries, archives, and museums have much advocacy work to do in order to persuade the government to support the development of a well-coordinated, effective system of information institutions. It must be noted that information technologies exercise a certain fascination and the discourse about the death of the book and libraries has reached Senegal where there continues to be debates about the need for printed materials at a time when access to the Internet is becoming somewhat more widespread. Even Senegalese political decision makers are becoming swayed by this technophile discourse, which is synonymous with modernity. The lure of technology has led the political leaders to place greater emphasis on the acquisition of equipment rather than supporting efforts to set up viable information institutions. Digitization of documents is also becoming a growing trend in Senegal. Professionals in the libraries and information services must bring thoughtful reflection to the digitization projects and also consider other strategies for making information available to all.

Abstract

This entry focuses on how research approaches labeled as sense-making or sensemaking are used to address user-oriented research relevant to the study of human information behaviors. This entry starts with a focus on the turn to sense-making in user studies and then reviews the historical and methodological roots and application contexts of the five most visible approaches that have addressed sense-making (or sensemaking) systematically in four fields: Human-Computer Interaction (HCI) (Russell's sensemaking); Cognitive Systems Engineering (Klein's sensemaking); Organizational Communication (Weick's sensemaking; Snowden's sense-making); and Library and Information Science (LIS) (Dervin's sense-making).

INTRODUCTION

This entry focuses on how research approaches labeled as sense-making or sensemaking are used to address user-oriented research relevant to the study of human information behaviors. This entry starts with a focus on the turn to sense-making in user studies and then reviews the historical and methodological roots and application contexts of the five most visible approaches that have addressed sense-making (or sensemaking) systematically in four fields: Human-Computer Interaction (HCI) (Russell's sensemaking); Cognitive Systems Engineering (Klein's sensemaking); Organizational Communication (Weick's sensemaking; Snowden's sense-making); and Library and Information Science (LIS) (Dervin's sense-making).

THE TURN TOWARD SENSE-MAKING IN USER STUDIES

Various terms referring to humans making something called "sense" are widely used in most human communities. We talk routinely of things that "make sense" and "do not make sense" and we ask others to "make sense."

Dictionary treatments of the term "sense" start with foundational emphases on basic human faculties of sensation and perception—sight, hearing, touch, taste, smell. These emphases focus on human faculties as transmitting tools that perceive in some way patterns of matter-energy, both inside the skins that enclose human bodies and outside in external environments.

Yet, dictionary definitions clearly branch out from here far beyond anchorings in human perceptual capacities to

such definitions as: intelligibility, intuitive knowledge, capacity for mental feeling, natural understanding, practical soundness, wisdom, consciousness, impressions, emotional sensibility, meaning, signification, and reasonableness. Likewise, attention to the term "sense" as a verb shows wide range. To "sense" is defined foundationally as to perceive and more broadly to: feel, experience, be aware of, comprehend, grasp, ascribe meaning to, understand, interpret.

In the last two decades, theories and studies focusing on users and user interfaces with information, media, and technology systems have increasingly referred to the neologisms "sense-making" or "sensemaking." In doing so, they all point in some way to their interests in how users make "sense" of the information resources systems actually or might provide. Different authors use one or the other of the two grammatical forms, most often deliberately. For sake of readability, sense-making will be used in this entry except in discussions of specific approaches when the forms preferred by specific authors will be used.

In understanding the differences in how the term sense-making is being used it is important to note how the full range of common parlance definitions have invaded scholarly treatments although very often in undefined ways. At one extreme, there is abundant attention to transmission theories of information processing asking whether humans are "sensing" what experts think they ought to. In transmission approaches to understanding users, focus starts with expert judgments of what is accurate, right, and proper in terms of information seeking, retrieving, and using. Experts draw these judgments out of normatively accepted knowledge-based domains. Usually, underlying these transmission assumptions is acceptance of a host of modernist assumptions about the nature of reality, information, and users that rest on often unstated agreements

that the job of information-oriented systems is to encourage and facilitate human access to information assumed to map the orderliness that is “out there” in reality but may elude individual human senses because of lack of access, skill, tools, and expertise. This has meant that the patterned matter-energy that we humans call information, the packages into which we humans put that information (e.g., books, television, journals, blogs), and the systems we create to store, retrieve, and disseminate that information (e.g., libraries, databases, knowledge management systems, media institutions) have been assumed to be edifices against which humans can be measured in terms of standards such as accuracy, breadth, depth, and skill of information processing. This tension between essentialist approaches to understanding human beings and interpretative approaches is in many ways at the center of the many versions of the so-called paradigm wars in the social sciences and humanities that marked the 1980s. While such discussions no longer take center stage, traces are very much still in evidence.^[1–15]

At the other extreme, there is growing attention to what can be called communicative theories of information processing asking how humans are understanding, interpreting, finding insight, and making meaning. Here attention is redirected, again with myriad vocabularies to meaning-making—to the insights, interpretations, significations, and utilities humans construct from the contents and packages of the patterned matter-energy normatively called information.

In both kinds of theories of sense-making—transmission and communicative—emphasis is placed on both outcomes (the sense made) and processes (the hows of sense-making). The ways in which attentions to outcomes and processes have been defined, however, likewise reflect that same movement from sense as measured in terms of its deviation from expertise versus sense as understood as resulting from processes that must be studied as least in part communicatively rather than simply as resulting from transmission.

The purpose of this entry is to give an overview of how phenomena that are labeled with the term sense-making are being defined, studied, and applied in user studies focusing on information seeking and use. The difficulty in choosing what approaches to sense-making to focus on is that there has been over the past decade an explosion of interests in something authors call sense-making, now being applied to a whole host of information-related behaviors (e.g., processing, retrieving, searching, gathering, foraging, using, Web-browsing, rejecting, collaborating, risk-facing, and so on) and a host of potential applications (e.g., the design of libraries, media, software, Web sites, information packages, information-focused pedagogies, knowledge management tools, organizational environments, and collaboration interfaces). For brevity's sake, the abbreviation HIBs (Human Information Behaviors) will be used to stand in for the diverse sets of

behaviors both internal (e.g., cognitive, emotional, spiritual) and external (e.g., seeking, finding, foraging, retrieving) that are the focus of user studies.

The call for attending to sense-making in studying HIBs is most visibly present not only in the LIS field but also in the fields of Cognitive Systems Engineering, HCI, and Organizational Communication studies. At the same time, collaborations and mergings between institutions, scholars, and practitioners representing all these fields are making it increasingly difficult to fix a particular approach to sense-making as belonging only to a particular discourse. These convergences have been impacting LIS particularly as manifested in what has become known as the “information school movement” in which formerly homogenous LIS units have incorporated interdisciplinary expertise from a variety of social science, humanities, and engineering disciplines.

The difficulty in fixing a stable picture of what might be called a “sense-making” approach to studying HIBs is further muddled by the increasing frequency of comparisons executed without anchorings in historical and discourse community roots. Too often issues regarding differences between approaches are reduced simply to matters of the use of different methods or arriving at more encompassing and thus more valid overarching theories. Rarely is there acknowledgment that the various approaches are not defining or addressing sense-making as phenomenon in the same ways.

The intent of this entry is to differentiate between the most visible approaches that are attending to something called sense-making. This entry intentionally focuses deeply on historical roots and methodological differences and does not limit itself to the sense-making approach that 10 years ago all but dominated references to user studies in the LIS field—that is, Dervin's Sense-Making Methodology. Purpose is to attempt to make “sense” of the treatments of sense-making that focus in their different ways on studies relevant to LIS because they address user HIBs, albeit using a variety of labels in very different contexts to focus on very different kinds of HIBs.

DIFFERENT APPROACHES TO SENSE-MAKING

One recent avalanche in literatures relevant to study of users has begun to refer to sense-making as a key concept with no definitional explications at all. The term has simply been co-opted into popular applied social science mainstreams. There have been, however, relatively isolated discourse communities in different fields where the term has received systematic attentions. These efforts do not have the status of field-wide acceptance but rather occupy significant enclaves within four different fields. As named above, the most visible fields where sense-making attentions reside include: HCI, Cognitive Systems

Engineering, Organizational Communication Studies, and LIS.

In general, it must be said that authors in these different fields study what they call sense-making in very disciplinary-centric ways. Work has proceeded in relatively bounded discourse communities with specialized vocabularies, assumptions, and research contexts.^[16–18] Authors may appear to address the same phenomena because they are using the same words (e.g., sense-making, information processing, users, retrieval, relevance) when in fact they mean very different and sometimes incommensurate things. This is additionally exasperated by recent practices of citing across these different approaches as if the differences do not make a difference.

Despite this background of interspersive confusion that is now a common feature of scholarly, research, and professional communities, in general, it is fair to say that all of those who have imported the term “sense-making” share common pulses. They have found accepted disciplinary vocabularies emphasizing cognition, attitude, opinion, information processing, and so on too confining. They have imbued into their projects at least in small measure a communicative sensibility—an interest in going beyond transmission assumptions regarding the interfaces between users and information systems. They share at least in small part a common attention to the idea that one reason research must move from transmission-based theories to communicative approaches is that our understandings of the ways in which information is useful to human life-facing have advanced beyond views drawn only from simplistic notions of modernity where already established and codified knowledge is seen as bridging all gaps. Instead, there is general acceptance of how complexity, uncertainty, and chaos theoretic approaches are needed—approaches that accept assumptions of the challenges human face as they move across time-space to changing environments and situations where knowledge as it is currently codified can rarely be complete enough to bridge all gaps.

Sense-Making in HCI

Human-Computer Interaction is a field, according to the Association for Computing Machinery (ACM)^[19] “...concerned with the design, evaluation, and implementation of interactive computing systems for human use...” Those identified with HCI usually conduct research in academic, corporate, and governmental settings for application to practice, in particular to design of interactive computing systems including hardware and software interfaces.

The terms sense-making and sensemaking have no presence as of this writing in the Wikipedia entry on HCI.^[20] However, there has been regular attention paid to sensemaking (using this grammatical form) by HCI researchers since at least 1993. The HCI sensemaking

community traces its emphasis back to what seems to be the first use of the term presented in a paper at CHI1993 by Dan Russell, Mark Stefik, Peter Pirolli and Stuart Card.^[21] Computer-Human Interaction (CHI) is an ACM special interest group.

In 1993, these authors were at PARC, the Palo Alto Research Center, Inc., a research and development company focusing in large part on human-computer interfaces. Much diffusion of a sensemaking emphasis has since ensued witnessed, for example, by PARC’s listing of sensemaking as one of its 2008 research foci.^[22]

Daniel Russell’s (et al.) sensemaking

The Russell group’s 1993 paper^[21]—“The Cost Structure of Sensemaking”—defined sensemaking as:

Making sense of a body of data is a common activity in any kind of analysis. Sensemaking is the process of searching for a representation and encoding data in that representation to answer task-specific questions. Different operations during sensemaking require different cognitive and external resources. Representations are chosen and change to reduce the cost of operations in an information processing task. The power of these representational shifts is generally underappreciated as is the relation between sensemaking and information retrieval.

With this paper and in their work since, the authors have most commonly examined the discrete cognitive steps, stages, and strategies with which users navigate databases seeking increasingly effective representations to support task-facings. The authors have been interested in understanding user sensemaking in specific information retrieval situations and then explaining and predicting user behavior so as to inform technology design choices. Typically, the research approach has involved qualitative and/or quantitative analysis of the online use histories of user engagements with particular database or software systems, sometimes coupled with in-depth interviewing and field observations.

All four authors have continued to pursue this research trajectory and have actively promoted understanding of sensemaking within the HCI community. Pirolli and Card, still working at PARC, have explored respectively sensemaking in relation to information foraging^[23] and sensemaking as it relates to information visualization.^[24] Other researchers from the HCI community such as George Furnas (University of Michigan) and Yan Qu (now at University of Maryland) have continued research programs focusing on much the same approach in varied contexts.^[25–27]

In general, this approach to sensemaking focuses on what users do to make sense during specific task-related HCI that involve information retrieval in some form. Sometimes, user behavior is examined as it naturally

occurs; sometimes it is examined in the context of specific design tools. The researchers have generally accepted that users do not navigate systems in orderly ways as prescribed by external experts. Russell and colleagues went to the essence of this community's focus in the call for papers for the CHI2008 Workshop on Sensemaking:^[28]

Making sense of the world is a ubiquitous activity, taking place around the margins of what we know. . . . It arises when we change our place in the world or when the world changes around us. It arises when new problems, opportunities, or tasks present themselves, or when old ones resurface. It involves finding the important structure in a seemingly unstructured situation. It is an activity with cognitive and social dimensions, and has informational, communicational, and computational aspects.

Sense-Making in Cognitive Systems Engineering

The second field having a visible systematic literature invoking the term sensemaking (using this grammatical form) is Cognitive Systems Engineering. On the surface, the approach seems almost identical with the HCI approach because both have focused on improving technology design solutions to better serve human needs. The differences between the approaches are important, however, because they reflect differing disciplinary and historical origins.

The Cognitive Systems Engineering Consortium defines its focus as: "...a design discipline that uses analyses of work (practice, structure, purposes, and constraints) to inform the design of process and technology for Human-System Integration." It examines cognitive work, traditionally viewed as "the thinking associated with knowing, understanding, planning, deciding, and problem solving." It sees cognitive work as involving the interplay between perception, cognition, and action and "...the way the interplay establishes meaning."^[29] Those focusing on sensemaking in this field generally work for industry, government (primarily military and defense), and academia and have backgrounds in psychology. They apply their expertise to designing more effective intersections between human cognitive competences, technologies, and work environments, particularly to computer and system designs.

Gary Klein's sensemaking

Gary Klein, a cognitive psychologist and leading figure in Cognitive Systems Engineering, has been the major proponent of this community's emerging focus on sensemaking. World-renowned for his pioneering work on decision making in natural settings, he was among those who concluded that laboratory models were not useful for understanding decision making in uncertainty

conditions.^[30,31] He founded Klein Associates Inc., where he spearheaded a focus on naturalistic decision making.^[32] In 2005, Klein Associates was acquired by engineering solutions development firm Applied Research Associates where Klein now serves as Chief Scientist.^[33] In addition to much cited books, Klein's primary publication venue has been *IEEE Intelligent Systems*, top-cited journal in electronic and electrical engineering. IEEE considers itself the leading association for the advancement of technology. Originally IEEE referred to the Institute of Electrical and Electronics Engineers Inc., but now the organization is known simply by its acronym.^[34]

The primary emphasis in Klein's work focuses on individual and team decision making. In a set of two 2006 coauthored papers, he described sensemaking as having "become an umbrella term for efforts at building intelligent systems."^[35,36] Klein et al., were careful to explain that a broad definition of sensemaking as "how people make sense out of their experience in the world" could easily encompass or be confused with concepts often studied in psychology such as creativity, curiosity, comprehension, mental modeling, and situation awareness. Instead, the authors anchored themselves in this definition: "sensemaking is a motivated, continuous effort to understand connections (which can be among people, places, and events) in order to anticipate their trajectories and act effectively."

Klein's primary empirical method is what he calls Cognitive Task Analysis^[37] (CTA) described in these terms: "In order to understand how people act upon the world around them, it is necessary to understand what goes on inside their heads. . . .to find out how they think and what they know, how they organize and structure information, and what they seek to understand better." Cognitive Task Analysis focuses on eliciting understandings from decision-makers of the cognitive events, structures or models they use in situation assessment, sensemaking, decision making, and planning activities. With empirical evidence from a large corpus of studies, Klein and colleagues extracted a list of refutations of stereotypes about how domain practitioners make complex decisions in dynamic environments.^[38] It is not so, they said, that: 1) data fusion and automated hypothesis generation aid sensemaking; 2) sensemaking is simply connecting the dots; 3) more information leads to better sensemaking; 4) it is important to keep an open mind; 5) biases are inescapable and prevent reliable sensemaking; and 6) sensemaking follows the waterfall model of how data leads to understanding.

Klein has emphasized that he studies sensemaking at macrocognitive not microcognitive levels. The macrocognitive positions people's problem solving behavior in terms of their views of complex sociotechnical systems while the microcognitive seeks to understand sequences of mental events. In a later paper, Klein and coauthors extrapolate their understanding of how sense making occurs in what they call a Data-Frame Model of

Sensemaking.^[39] They emphasized, as Klein has continually done, that experts make decisions primarily through an “...understanding of the current situation, how it got there, and where it is going.” However, the situational awareness here focuses not only on how the current situation invokes a working memory of the past but rather how experts make sense amid “...the growing suspicion” in the face of “...unexpected changes and surprises” that the “...current understanding is incorrect.”

Using performance observations, interviews, and incident accounts, this research studies sensemaking as the process by which individuals and teams come to understand gaps between their initial accounts and new incoming data. The research focuses on how sensemakers get fixated on current explanations, investigate inadequacies, and then reframe accounts. The ultimate goal is what Klein and coauthors call Decision-Centered Design, in which sensemaking is one of a number of macrocognitive functions that are supported in design solutions.^[40]

Sense-Making in Organizational Communication

There are two highly visible proponents of a focus on sense-making in organizational communication: Karl Weick and David Snowden. Weick deliberately uses the term sensemaking in order to convey the idea that the term is so all encompassing that it needs to be distinguished as a new concept.^[16] Snowden uses both terms—sense-making and sensemaking—interchangeably to refer to a whole set of processes specifically addressed in his organizational interventions. While Weick and Snowden both focus on organizational communication and share many assumptions in common they come from different backgrounds and pursue their projects in distinctive ways.^[41]

Karl Weick's sensemaking

Karl Weick is a social psychologist whose career has been mostly academic. He currently serves as professor of organizational behavior and psychology in the University of Michigan Ross School of Business. Drawing from his social psychologist's background, he emphasizes tensions inherent in organizational life such a threat versus rigidity, commitment versus decommitment, doubt versus self-fulfilling prophecy, and dissonance versus assurance. He brings this rich emphasis to bear on his central focus: “the conditions that precipitate the collapse of sensemaking in organizations.”^[42] In doing so, he attends with a broad and interdisciplinary reach to the intersections of literatures from social psychology, organizational studies, and communication. He generally works from theory to research practice but then turns his research results into recommendations for specific organizations and uses them as well to amplify his theoretic ideas.

He often cited 1996 book, *Sensemaking in Organizations*,^[16] describes sensemaking as a process involving

comprehending, constructing meaning, searching for patterns and frameworks, redressing surprise, and interacting with others in the pursuit of common understandings. Sensemaking, he emphasizes, should not be used as a synonym for interpretation which emphasizes a one-way relationship between interpreter and text. Sensemaking is also about authoring. It is not outcome but process—ongoing, social, retrospective, driven by plausibility rather than accuracy, and grounded in identity construction. It is about the enlargement of small cues. It is a search for contexts within which small details fit together and make sense. It is people interacting to flesh out hunches. It is a continuous cycling between particulars and explanations, with each turn giving added form and substance to the other. Sensemaking is concerned with how people “construct what they construct, why, and with what effects.”^[16]

Weick has generally applied his attention to sensemaking to those organizations that require acute mindfulness to avoid small errors, that is, High Reliability Organizations. He conceptualizes organizations as “...social structures that combine the generic subjectivity of interlocking routines, the intersubjectivity of mutually reinforcing interpretations, and the movement back and forth between these two forms by means of continuous communication.”^[16]

The emphasis on eliciting narratives which is a hallmark of Weick's approach is rooted in the central idea that storytelling is democratic: anyone can tell a story and anyone can criticize and analyze a story. “When people tell a story they are invoking a personal philosophy of reason, value, and action.”^[43] A narrative approach interrupts the privileged edifices of expert interpretation frozen in the past and requiring special technical skills for comprehension.

Weick's research approach is enacted through field studies involving both observation and interviews with primary emphasis on attending to narratives. Among the organizations he has researched have been jazz orchestras, firefighters, aircraft carriers, and power plants.^[44] The research typically involves intensive and overtime observation and/or interviewing reconstructions of organizational events from different vantage points and different observers.^[45,46] These are sometimes interspersed with workshop discussions with organizational representatives. Systematic analyses involve the use of triangulation of selected “interpretations” (usually those of multiple researchers) coupled with grounded theorizing approaches as espoused by Glaser and Straus.^[47] Various paper and pencil data collection tools are sometimes used.

Research usually concludes with recommendations to specific organizations as well as mandates for organizational life. An example of the latter is the Weick, Sutcliffe, and Obstfeld emphasis on how organizations must focus not only on successes (which potentially lead to hubris) but on failures, doing so as a means of regular iterative review without fear of punishment.^[48] Another example is

a call for fostering individually distinctive interpretations on what is going on and accepting diverse inputs in order to counteract oversimplification.

Weick's work in organizational sensemaking is highly diffused and cited. According to the ISI Web of Knowledge database (as of August 28, 2008), there are some 4600-plus journal articles that have cited his writings giving Weick a status within ISI as a "highly cited author."

David Snowden's sense-making

David Snowden's approach to sense-making shares much in common with that of Weick. Both have focused largely on organizational decision making, strategy development, and dealing with complexity. Both emphasize the value of narrative as a procedural response to complexity. Both pinpoint a need for organizations to move away from emphasizing top-down hierarchies to fluid structures responsive to changing and often elusive conditions.^[41] Both use direct involvements via workshops and other interventions as an inherent core of their research-application processes.

In contrast with Weick, Snowden implements his approach not from within academia but from organizational settings. He has been identified as a major figure in the movement toward integration of humanistic approaches to knowledge management. He defines his project as naturalizing science-based approaches to decision theory and sense-making, bringing together both academic and practitioner perspectives. A native of Wales, he has a background in philosophy and business administration. He also makes frequent references to literacy and science fiction sources in his work.^[41]

Formerly Director of the IBM Institute of Knowledge Management, Snowden is currently Founder and Chief Scientific Officer of United Kingdom-based Cognitive Edge, an international network of organizational consultants that focuses on rejuvenating management practices to better equip organizations to address intractable problems and uncertain and complex situations. Cognitive Edge's approach to research is based on action research principles.^[49] The approach typically involves interacting with representatives in organizations using participatory and discovery methods so that issues and problems can be explored in a coevolutionary process.

In this context, sense-making is defined as "how we make sense of the world so we can act in it." Snowden and colleagues focus on developing and implementing tools and practices for analyzing narrative complexity in real organizational settings. One example is a branded software named "SenseMaker Suite" that provides tools for applying the themes of narrative, complexity, and networks directly into organizational analysis and practice. Snowden explicitly focuses on the development of specific alternative forms of organizational dialogue with labels

such as "Story Circles" and "Knowledge Discourse Points."^[49]

The glue that holds much of this in place as described in Snowden's writings is an emphasis on "Cynefin"—a Welsh term referring as noun to habitat and as adjective to being familiar.^[50,51] Cynefin is one of Snowden's organizing concepts, pointing to the idea that responding to complexity requires a sense of place that enables one to advance diverse views (i.e., different storytellings) and imagine narratives of what happened, what could have happened, and how to act differently in the future.^[41,52-54]

From this anchoring in situated narratives, Snowden engages his organizational participants in differentiating between different kinds of sense-making gaps. One set of five distinctions involves differentiating between the simple, complicated, chaotic, complex, and disorderly. This framework might be used to gain insights into contentious issues, plan interventions to move situations from one domain to another, consider how to approach or manage different communities of practitioners, or develop strategies for knowledge retention.

In conjunction with the use of his various frameworks, Snowden employs action research methods such as contextualizations, narrative databases, convergences, and alternative histories. In his research, Snowden moves from a set of highly abstract philosophic premises to the dialogic practices and inventions he uses in his organizational interventions. From these he has developed tools for analyzing complexity in organizations that in turn gives feedback to his research emphases.

LIS

While LIS is the one field that most exhibits convergences between the various approaches to understanding sense-making, these convergences are of recent origin. Historically, the one approach to sense-making that has most marked LIS since 1986 is Dervin's. The germinal reference is the Dervin and Nilan review in the 1986 *Annual Review of Information Science and Technology* that called for a turn away from "traditional" approaches to studying users in which information is defined as objective, humans are seen as input-output processors, and the aim is to arrive at *trans*-situational propositions regarding information seeking and use.^[4] The authors called instead for a turn to "alternative" approaches where information is defined as outcome of human constructing processes and humans are seen as making "sense" in response to changing and sometimes elusive conditions.

Since 1986, there has been an explosion of interests in user-oriented studies in LIS. This has led to the establishment of a special interest group in the American Society of Information Science and Technology focusing on information seeking and use (SIGUSE); and the founding of the European-based Information Seeking in Context

(ISIC) consortium that holds biannual conferences. Dervin has been frequently identified as instrumental in these developments and one of the key instigators of the shift from system-centered to user-centered research in information science.^[55–59]

Brenda Dervin's sense-making

Dervin's disciplinary background is the field of communication.^[60] Prior to her graduate studies she served as communication practitioner focusing on communicating with the urban poor. After graduate school she brought this specialty to the then Syracuse University School of Library Science, now incorporated in Information Studies. Since that time she has been located at the University of Washington (1972–1986) and Ohio State University Schools of Communication. Her emphasis has expanded from the poor to any communication efforts where experts attempt to communicate with nonexperts via their messages, procedures, or system designs. Dervin is often quoted as stating that in some context, we are all information poor.^[61] For her, the biggest gap between users is not their differences as defined by outsiders but the yawning gap between nonexperts and expertise frozen in historical pasts and locked in specialized discourses.^[62,63]

Dervin focuses broadly on phenomena she terms sense-making and sense-unmaking. Her mandate is to understand how individuals engage internally (intrapersonally) and externally (interpersonally and via mediated communication) with the patterned matter energies that humans call by varied names—for example, observations, information, expertise, knowledge, wisdom. Since the 1970s, Dervin's writings have pivoted around a central theme—a call to focus on communication as communication rather than as transmission and to bridge gaps between research and practice with user-oriented research. Dervin's emphasis is applied to users and potential users by any other name, for example, patrons, audiences, patients, employees, citizens, leaders, constituents, customers, and so on. In addition to users of her work in LIS, Dervin's approach has been applied in numerous research communities, for example, pedagogy, media studies, public communication campaigns, citizen participation, development communication, and health communication.^[63]

While her work has gone through developmental transitions since first being labeled as focusing on sense-making,^[4,64] in its current form it consists of a comprehensive theory of how dialogue must be conceptualized to work communicatively.^[17,18,62] Dervin sees user research as an instance of dialogue. She aims to theorize human sense-making in the realm of what she calls “verbings” that rise above the specific noun-based idiosyncrasies of formalized information domains to the universals of

how humans navigate the human condition where discontinuities are ever-present constants even in the most orderly of conditions.

She shares with all those who focus on sense-making a reach for attention to human beings in ways more holistic than traditional emphases have allowed. She also shares the common emphasis on humans making sense amid uncertainty, complexity, and chaos. She shares especially with Weick and Snowden their emphases on facilitating diverse voices to speak and be heard, their use of various philosophic inputs, and their emphases on narrative and storytelling. With Snowden, she shares an interest in inventing alternative systematic forms of communicative intervention.

What differs in Dervin's Sense-Making Methodology is that of all the approaches it is the only one that moves from a generalized set of philosophic premises to a fully explicated methodology and practice for studying and engaging sense-making. In addition, Dervin's approach is not anchored in specific research contexts but has been designed to be useful in any context that involves communicating intrapersonally, interpersonally, or via mediated means.

For Dervin, research is itself treated as sense-making and is not privileged as a special stance outside the phenomena it studies. What Dervin proposes is that understanding the sense-makings of others cannot be simply a matter of using open-ended queries and inviting alternative voices to the table. Rather, it requires a designed reframing of communicative processes, a reframing that explicitly attends to philosophic assumptions implemented in visibly aligned methods.

The most well-known example of the application of Dervin's Sense-Making is to the methodology's interviewing approaches.^[62,65] These are all organized around a central Sense-Making Metaphor that draws together the approach's philosophic premises mandating that user studies attend systematically to: context, time, space, movement, gap, horizon, energy, power, history, experience, constraint, change (flexibility, caprice, chaos), and constancy (habit, inflexibility, rigidity). Briefly stated, these mandates require that users be studied as navigating situations while traversing two constant discontinuities of the human condition. The first is gappiness between times, spaces, and human as well as nonhuman entities that can never be bridged entirely with a priori information or instruction. The second is the struggle to sense-make one's own agency and to simultaneously sense-make one's engagements with external structures (e.g., communities, collectivities, organizations).

In its briefest form the metaphor is called the Sense-Making Triangle^[62–64] linking situationally-based step-takings out of specific histories to the building of bridges (e.g., cognitive, emotional, spiritual, physical) across ever-present gaps and sensing outcomes (e.g., consequences, impacts, effects that help and/or hinder) that then in

themselves become grounds for the next step-takings. This metaphor is not intended to suggest all human sense-making involves problem-solving or decision-making although these are conceptualized as among the possibilities.

Briefly, these philosophic assumptions mandate that sense-makers be seen as: changing as they move through time-space; navigating both certainty and uncertainty and the gaps between; sometimes confused, sometimes in doubt, and sometimes sure; struggling with how to be the same as others and yet be different; struggling, at least sometimes, with imposed structures and power constraints, albeit sometimes silently, sometimes unconsciously; sometimes acting as agents of structures, and sometimes acted on and resisting them.

In interviewing practice, these assumptions are applied in a series of different interviewing approaches conceptualized as implementing a fully developed theory of the interview.^[62] Each of the approaches involves eliciting from informants situated narratives anchored in descriptions of internal and external movements through time-space. The various interviewing approaches, labeled with such names as the Micro-Moment Time-Line, Life-Line, Micro-Element Interview, and Help Chaining, all involve bracketing time-space in different ways. They serve different purposes depending on research, application, or dialogic context.

At the core of every interview is repeated uses of Sense-Making Triangulation where informants are anchored in specific time-space moments and asked a roster of questions—adapted with vocabularies suitable to informants and context—based on these core elements: What happened? How did it connect with your life/past/work? What questions, confusions did you struggle with? What ideas/conclusions/insights did you arrive at? What emotions or feelings did you have? How were you helped and/or hindered? How did you hope to be helped? How did this connect to constraints and power dynamics as you experienced them? The intent of the questioning is to insofar as possible keep researcher and expert nouns and understandings from being imposed during the interviewing process.

Over the years, rosters of central Sense-Making categories have emerged that are used for systematic analyses. The categories focus on “universals” of sense-making drawn from 30 years of projects across myriad contexts and applications. One example category set addresses how users see their micromoments of situated sense-making stopped at junctures requiring new or revised sense and/or abandoning old sense. The categories use such names as: decision, barrier, spin-out, wipe-out, tightrope, time passing, waiting, being chased by time, observing, moving. The category labels illustrate how the methodology attends to context-free universals even while mandating that user narratives be elicited in context and situationally anchored ways.

The various Sense-Making categories form a basis for Sense-Making's approach to Situational Contingency Analysis.^[62,65] The primary gain from using this analytic approach to date has been to show repeatedly that users when seen through the lenses of their views of their situated movements in time-space are rarely well understood or predicted in traditional terms by measures that freeze individual users to attributes such as demography, personality, or cognitive style that transcend time-space. Likewise, users are rarely predicted well by attributes that freeze situations, tasks, domains, or contexts with expert driven framings that assume users see these as the same as they move through time-space.

The execution of Sense-Making informed studies have taken on many forms. All have interviewing as foundation, but administered in numerous ways—in person, by phone, online, text messaging, self-administered; executed in formalized surveys, laboratory settings, and in the field via participant observation and ethnographic approaches. The interviewing core has always involved the methodology's mandated structure of open-ended questions. Close-ended queries are sometimes added in ways consonant with the methodology's metatheoretic premises. Analyses involve both quantitative approaches including systematic content analyses and statistical displays, and qualitative approaches informed primarily by grounded theory^[44] and use of Sense-Making's Situational Contingency Analysis. Some applications have involved field or laboratory experimentation focused on dialogic invention and intervention. In these cases, Sense-Making Methodology informs both the design of the communication inventions and the researching of their impacts.

While cited, according to the ISI Web of Knowledge, in more than 1000 journal articles, most references to Dervin's work uses it to document a generalized call for more user-oriented approaches. About 120 authors have gone beyond this general usage to systematically applying Dervin's approach in small or large part to research that has been applied to message, information, procedure, and system design; and to the design of communicative interventions for dialogue. Among the notable full-scale applications are a series of studies spearheaded by Dervin and funded by governmental agencies at the state and federal levels. Examples include Dervin's early studies of the everyday information needs of residents in Seattle in 1976^[66] and California in 1984.^[67] The most recent application is an Institute of Museum and Library Services (IMLS) funded study of college and university users in central Ohio.^[68,69] Dervin has also supervised a large roster of doctoral dissertations that have applied the methodology to myriad kinds of users in varied contexts.

Some LIS anchored researchers who have given sustained attention to Dervin's approach include Savolainen^[70,71] at the University of Tampere, Finland, particularly with his attentions to improving user studies of HIBs; Fisher and colleagues at the University of

Washington^{[72],[73]} in their studies of the information grounds from which users move. In addition, the projects of a number of LIS researchers who have developed their own versions of a variety of user-oriented approaches to studying HIBs have drawn on Dervin particularly in the early stages of their projects. Examples include: Chatman;^[74] Durrance;^[75] Kuhlthau;^[76] Nilan;^[77] Ross;^[78] and Solomon.^[79–81] The most well-known application to design in LIS is Sense-Making Questioning originally presented as Neutral Questioning.^[62,82] This approach to the procedures of the library reference interview is still being taught in many LIS schools and used actively in some library systems.^[83]

SENSE-MAKING APPROACHES AS CLARION CALL

The approaches to sense-making described above have all been used in different contexts to focus on understanding HIBs, albeit using discourse-distinctive vocabularies. All have extracted recommendations for system designs and practices that will help humans better meet changing and often elusive situational conditions. All veer to the humanistic and veer away from the mechanistic. All move out of formerly accepted models of information exchange as transmission toward more interpretive, narrative, and phenomenological approaches.

At the same time, the approaches differ, sometimes subtly and sometimes distinctly. The fact that the approaches use common vocabularies belies how they proceed in quite different ways for quite different purposes. Some of the differences are easier to penetrate for they involve more readily identifiable differences in research intent and focus—who the research is conducted for; how it is used; what kind of HIBs it focuses on; in what kinds of contexts, situations or tasks; within the brackets of what time horizons; and, pointing to what kinds of outcome.

Other differences are far more subtle. Despite surface appearances of similarities, penetrating to the meanings deeply anchored within each of the different sense-making discourse communities takes time-consuming study. Deeply held assumptions are often unstated, understandably most often in approaches anchored in fields that privilege research applications to practice. Some approaches emphasize epistemology, focusing primarily on interpretive differences between sense-makers. Others emphasize ontology, focusing more on the different sense-making requirements of elusive and changing situations. Some focus at the micro level, some macro, and some both. All do a little bit of all these although sometimes only implicitly. The differences are a matter of emphasis in both articulation as well as procedure. More often than not, the tools that would allow the unraveling of these deeply rooted differences are themselves hidden beneath

surfaces. Most efforts to compare and contrast assume essentialist meanings and, thus, execute approaches to dialogue based on transmission rather than communicative theories of communication.^[17,18]

Clearly, while not all those who have turned to studying sense-making share an entirely common roster of assumptions, all have attempted to change traditional and accepted transmission oriented approaches in their research. They all reach as well to look at HIBs in ways that attend to complexity, chaos, and uncertainty. This a fundamental change and enlargement in the “paradigm” accepted for studying the human condition. Given the magnitude of this change and the challenges of the intellectual grounds that are being traversed, it is not surprising that there are inconsistencies, even contradictions, between the various approaches.

The move toward focusing on sense-making can be seen as having two major trajectories. One is a general trajectory in which the term sense-making serves as a clarion call, a marker of the growing energies directed at studying human beings and HIBs in more humanistic ways. The second trajectory is the way the term, in its various grammatical forms—sense-making and sensemaking—is being implemented to meet this clarion call in specific research and application contexts. The difficulty, for the reader attempting to grasp what sense-making is, is understanding that sense-making is not any one phenomena seen in any one way. The very difficulty of its defining and the inability to hold it still is itself a trace of the very sea-change in the understanding of HIBs toward which it may be said the sense-making movement directs research and design attention.

CONCLUSION

This entry has focused on how research approaches labeled as sense-making or sensemaking are used to address user-oriented research relevant to the study of human information behaviors. Starting with a focus on the turn to sense-making in user studies, this entry reviews the historical and methodological roots and context applications of the five visible approaches that have addressed sense-making systematically in four fields: HCI (Russell’s sensemaking); Cognitive Systems Engineering (Klein’s sensemaking); Organizational Communication (Weick’s sensemaking; Snowden’s sense-making/sensemaking); and LIS (Dervin’s sense-making).

Serbia: Libraries, Archives, and Museums

Staša Milojević

Department of Information Studies, University of California, Los Angeles, Los Angeles, California, U.S.A.

Abstract

This entry provides a brief historical overview of the emergence of libraries, archives, and museums in Serbia. It describes the current environment of these cultural and information institutions, including their legislation, organization, staffing, collections, automation, and services. Representative institutional profiles are also given. The entry also discusses professional education in library science, library associations, and interinstitutional cooperation.

INTRODUCTION

The Republic of Serbia is a country in Central- and South-eastern Europe. It is bordered by Hungary to the north, Romania and Bulgaria to the east, Former Yugoslav Republic of Macedonia and Albania to the south and Montenegro, Bosnia and Herzegovina, and Croatia to the west (Fig. 1). Serbia is divided into 24 districts plus the City of Belgrade. The districts and the City of Belgrade are further divided into 161 municipalities.^[1] Serbia has two provinces: Kosovo (full official name Kosovo and Metohija) and Vojvodina. The part of Serbia that is neither Kosovo nor Vojvodina is called Central Serbia. Unlike the two provinces, Central Serbia is not an administrative division. Since the armed conflict and NATO intervention in 1999, Kosovo has been governed by the United Nations Interim Administration Mission. According to the 2002 census, Serbia (without Kosovo) had a population of 7,498,001.^[2] Serbia is populated mostly by Serbs (82.9%). Significant minorities include: Hungarians (3.9%), Bosniaks (1.8%), Roma (1.5%), Croats (1%), and Slovaks (1%). The census was not conducted in Kosovo. According to the *CIA World Factbook*, Kosovo had an estimated population of 2,126,708 (Albanians 88%, Serbs 7%, and other 5%) in 2007. With 71,111 refugees from Croatia, 27,414 from Bosnia and Herzegovina, and 206,000 Serbs and Roma internally displaced from Kosovo, Serbia has the largest refugee population in Europe. The official language is Serbian, a Slavic language.

Serbia is on one of the major thoroughfares from Western Europe to Turkey and the Middle East. It is also intersected by several major navigable rivers that connect Serbia with Northern and Western Europe. Belgrade and Novi Sad are major regional Danubian harbors. Serbian terrain is extremely varied: to the north lies the rich fertile Pannonian Plain. To the east, limestone ranges and basins, and to the southeast mountains and hills. Over a quarter of Serbia's landmass is covered by forests.

Although it had a favorable economic outlook at the beginning of the process of economic transition in 1989, years of mismanagement of economy, U.N. economic sanctions (1992–1995), and the damage to the infrastructure and industry during the NATO airstrikes (1999) took their toll. In 2000, Serbia's economy was only half the size it was in 1990. And although its economy, with the GDP for 2008 estimated at \$80.717 billion and \$10,985 per capita PPP, is considered an upper-middle income economy by the World Bank, it still faces many problems, the most prominent of which are high unemployment, high export/import trade deficit, and considerable national debt. Serbian economy is based mostly on various services, industry, and agriculture.

Serbia is still developing its telecommunication infrastructure. In 2007 89% of households had fixed telephone lines, and 74.5% of households had a cell phone.^[3]

In 2008, 40.8% of households had a computer. One-third of all households had the Internet connection, of which 51.1% had a dial-up connection, 24.4% had Asymmetric digital subscriber line (ADSL), and 23.2% had cable Internet.^[4]

HISTORICAL OVERVIEW

The Serbs, a Slavic people, settled the Balkans in the seventh century. Timeline of major historical events is provided in Appendix 1. They adopted Christianity in the second half of the ninth century. From the eighth to the twelfth century they inhabited the lands under the Bulgarian and the Byzantine rule. In the twelfth century, under the Nemanjić dynasty, Serbia became a kingdom with an autonomous Orthodox Christian church. Saint Sava, son of Stefan Nemanja, the founder of Nemanjić dynasty, is accredited with writing the first Serbian prose, dealing with the life of his father. He is also acknowledged for laying the foundations of the national, religious, and

Fig. 1 Map of Serbia.

cultural identity of Serbia. The most important libraries in the medieval Serbia were those in the monasteries of Studenica (twelfth century), Žiža (thirteenth century), Gračanica (fourteenth century), Dečani (fourteenth century), and Manasija (fifteenth century). The most outstanding library was the collection of the monastery Hilandar (1199), which was founded by Serbian rulers on Mount Athos in Greece.

With the end of the Nemanjić dynasty in the fourteenth century the Serbian lands became fragmented among the competing nobility. The fragmentation made it harder to resist the advancement of the Ottomans who won two major battles against Serbs in 1371 and 1389. The country finally succumbed to the Ottoman Empire rule in the fifteenth century.

Under the Ottoman Empire rule the majority of Serbian population lived in the countryside, in small villages organized on traditional bases. The Orthodox church played a particularly important role by preserving the national identity and keeping the memory of the medieval Serbian kingdom. The center of the church was the Patriarchate of Peć (Province of Kosovo).

In the seventeenth century, Serbs helped Habsburg troops gain significant territory from the Ottomans. As the Habsburg forces were pushed back, Patriarch Arsenije III and over 30,000 families who feared massacre migrated with the retreating army to settle in the Habsburg lands. At the time of great migration in 1690 Serbs were promised freedom of religion and an autonomous church administration by the Habsburg ruler, Holy Roman Emperor Leopold I. Thus, Serbs had a relatively favorable status in the Habsburg

Empire. As in the Ottoman Empire, the church dignitaries were in practice the leaders of “shadow” Serbian secular government, with a Serbian metropolitan, established at Sremski Karlovci, at its head. Sremski Karlovci (Province of Vojvodina) became the foremost Serbian religious, cultural, and educational center. The first Serbian schools of higher education were established there.

The Orthodox church served as a major vehicle in the transmission and preservation of past traditions. It provided the only available education. Another method of the transmission of culture and history among illiterate peasants was by storytelling and oral epic and popular poetry. This oral literature had both historical and religious themes. The literary language at the time was the so-called Serbian-Slavonic, an artificial creation close to Church Slavic, but not to the speech of the common people. Vuk Stefanović Karadžić (1787–1864), the most important linguistic reformer and the great leader of the Serbian intellectual and literary renaissance, created both the modern Serbian literary language and the modern Serbian literature. He simplified Serbian orthography and introduced the “living” people’s language into literature.

After the first (1804–1813) and the second (1815) uprising against the Ottomans, the social-political and economic development in Serbia was dynamic. First secular schools were being opened right after the first uprising, replacing monastery schools. By the end of the uprising, there were around 50 schools funded by local municipalities or by parents. The first higher education institution (Velika škola) was founded in Belgrade in 1808 to educate first civil servants.

After Serbia gained the autonomy within the Ottoman Empire in 1830 the conditions became favorable for the systematic development of education and the establishment of cultural and scientific institutions. During the first decades of the autonomy, the chief intellectual influence came from the Serbs living in the Habsburg Monarchy who became an important element in the new bureaucracy. One of the first institutions to be established by the newly formed Serbian government was the Printing press in 1831. It was followed by the foundation of the National Library in 1832; the first Serbian theater and its library in 1841; The Serbian Learned Society and its library in 1842; the Library of the Serbian Lyceum in 1844, and a number of reading rooms in Belgrade and larger towns in Serbia from 1846 onward. The appearance of reading rooms (*čitališta*) in Serbia during the 1840s was important for the history of books and libraries. The reading rooms were based on the models from Western Europe. They became the public cultural institutions established by the emerging middle class to serve their cultural, national, and political development.^[5] There are records on 79 reading rooms that were active between 1846 and 1900. These reading rooms had the function of public libraries, although they were never funded by the state. The development of all types of libraries in Serbia was not the result of an

organized state policy, but came out of the need for books by different types of users. The first official librarian, Filip Nikolić, was the first person to professionally organize the National Library in the period from 1853 to 1856. He set the foundations of cataloging for the library following the Austro-Hungarian regulations, and formulated the library's first set of procedures.

The country finally gained independence with the Treaty of Berlin in 1878. As a parliamentary monarchy Serbia went through a period of economic and cultural prosperity. The 1901 Law on National Library was very important for librarianship in Serbia. This law was based on best practices in librarianship from abroad (mainly Western Europe). It also defined the role of the National Library as well as public libraries. The libraries were considered educational institutions with the aim of supporting science and educating the population. The regulation regarding the state exam for National Library personnel from 1928 is the first regulation on the obligatory education for the librarians in Serbia. However, no formal or informal library training was provided until after the end of World War II.

Serbia joined union of states (soon to be named Yugoslavia) in 1918. Its capital, Belgrade, also served as the capital of the joint state. After World War II the monarchy in Yugoslavia was abolished and the Communist Party took power and established a socialist state. Serbia was one of six federal units ("the republics") of the state. Under the leadership of Josip Broz Tito (1892–1980) and his successors Yugoslavia pursued a policy of neutrality during the Cold War, managing to steer its path between the Warsaw Pact nations and the West. It became one of the founding members of the Non-Aligned Movement along with countries like India, Egypt, and Indonesia. Besides the close ties with developing countries, Yugoslavia maintained cordial relations with the United States and the Western European countries. It was the first communist country to open its borders to all foreign visitors, and to abolish visa requirements in 1967. After the breakaway from the Soviet sphere in 1948, Yugoslavia came up with its own form of communism that allowed for some degree of free market called "market socialism." People enjoyed far greater liberties than in the Soviet Union and Warsaw Pact states. The federal state dissolved in the early 1990s, with only Serbia and Montenegro remaining in the union. The following decade brought civil war in the region and economic destruction of the country which culminated in NATO bombing campaign in 1999. In 2000 democratic changes swept the country, and Serbia entered transitional phase with aspirations of joining the European Union. In 2006 both Serbia and Montenegro became independent states.

LIBRARIES

Libraries in Serbia today are organized in a system of central libraries performing coordinating functions. The

system was set in place by 1960 Republic of Serbia Library Law. It is currently regulated by the 1994 Library Law. Central libraries manage library registers, create library catalogs, offer professional assistance, monitor professional activities, provide continuing education for library staff, analyze current conditions, and suggest improvements. The National Library of Serbia is the central library for all libraries in the country. Matica Srpska Library is the central library for all libraries in the province of Vojvodina, and University Library "Svetozar Marković" is the central library for all university, college, and research libraries in Central Serbia. This organization is regulated by the 1994 Resolution on Libraries performing coordinating functions. According to this Resolution, each county has a central library, a major public library, which oversees the functions of smaller public libraries. All coordinating activities are funded by the government. All central libraries contribute to and maintain "Serbian libraries network," a database containing statistics on all member libraries. At the end of year 2006 there were 2389 libraries in this network.

As a part of the coordinating activities, the National Library of Serbia and Matica Srpska Library conduct state professional examination of some 200 librarians twice a year. The central public libraries organize 10–20 seminars and 3–5 conferences for library staff under their jurisdiction. The National Library of Serbia, the Matica Srpska Library and the University Library "Svetozar Marković" are also the main leaders who implemented the project "Virtual Library of Serbia." The Virtual Library of Serbia^[6] has: the union catalog with over 1.9 million bibliographic records; the online library catalogs of participating institutions; a database of libraries participating in the collaborative cataloging; bibliographies; and portals to electronic journals and online databases.

In 2005 central libraries formed the Association of Central Libraries of Serbia,^[7] the role of which is enhancing coordinating functions. In 2007 the Association started the "Biblionet" project, an annual conference promoting both scholarly and professional contributions, proceedings of which are published by the Association.

The activity of libraries in Serbia is bounded by a set of laws regarding libraries, press, cultural property, and copyright. The major laws are: The Library Law from 1994; Cultural Property Law from 1994; Press Law and its amendments from 1991, 1993, and 1994; Civil Service Law from 1991; and Copyright Law from 2002. A number of new laws are in the process of being written: Culture Law, Library and Information Law, Cultural Property Law, and Legal Deposit Law.

The major library association in the country is Library Association of Serbia,^[8] founded in 1947. The aim of the society is to promote the professional interests of librarians. The Association has been an International Federation of Library (IFLA) member since 1950. It has been publishing professional journal *Bibliotekar* since 1949. The

Association has also established several awards, the most important being “Stojan Novaković” for the best book on library and information science, and the “Best librarian” award. In the last 5 years, the Association has been organizing annual international conferences.

A new type of association, the Consortium of the libraries in Serbia for Cooperative Acquisition (KOBSON),^[9] was formed in 2001. The idea for the creation of the consortium came from the directors of major academic and research libraries and the representatives from the Serbian Academic Library Association. The National Library’s Center for scientific information took a leading role in founding and managing KOBSON. The primary aim of this consortium is cooperative acquisition of scientific journals in both print and electronic format. In 2003, through the funding from the Ministry of Science, Technology, and Development, the consortium purchased 800 printed works and obtained access to 9000 electronic titles. In 2002 the consortium became an active member of the Electronic Information for Libraries (eIFL) project, the aim of which is to enable access to full text databases to countries in transition. The first publisher to participate in the project was EBSCO, providing access to eight databases with approximately 5000 journals, primarily in social sciences and medicine. Today, the project is fully funded by the Ministry of Science, Technology, and Development and offers access to full text of 35,000 journals to 387 participating libraries of all types. It also provides access to electronic books through ebrary (offering access to 30,000 scientific books) and Oxford Scholarship Online (offering access to 1300 books).

National Library of Serbia

The National Library of Serbia^[10] was founded in Belgrade in 1832 while parts of Serbia were still under the Ottoman rule. The library was first established as a town library, then served as the library of the State Printing Press (1833–1838), and as the library of Ministry of Education (1838–1870). However, from the very beginning it was receiving depository copies, thus acquiring the character of a national library. One of its missions from the outset has been to collect and preserve each Serbian book in order to document the national heritage. World War I brought losses to the library. Part of the collection was destroyed in Austrian bombing. In 1928 the library started producing the current national bibliography. In 1940 it started publishing *Glasnik Narodne biblioteke*, a refereed journal on library and information science, which is still being published.

However, World War II brought even harder blow to the library. The library was completely destroyed in German air raids on April 6, 1941. The reconstruction of the destroyed library began almost immediately, during the war at which time the library absorbed several collections (those of the Parliament, Senate, the Court, and the Saint

Sava Society), as well as personal libraries of some of the literary figures and university professors.

In 1947 the library made its collection of 133,574 items again available to the public. The library was appointed the central library of the Republic of Serbia. In 1953 the Library Center, later to become the Department for the Promotion of Library Services was founded. In 1960 the library also added the Bibliographic Department, charged with compiling the Serbian retrospective bibliography; the Palaeographical Department, whose function was to describe and register South Slav Cyrillic manuscripts; and the Conservation Laboratory for the conservation and preservation of library materials. The library started the construction of the new building in the 1960s, which was inaugurated in 1972. In the following years the National Library started using various international standards, such as International Standard Bibliographic Description (ISBD) and Universal Decimal Classification (UDC). In 1987 the library started Cataloging-in-Publication service for monographs. In 1989 it established an online catalog for all new acquisitions, and the cataloging cards stopped being produced for new acquisitions in 1991. In 1996 the library got its local computer network and Internet access, as well as its first Web site.

The National Library is the central copyright depository of the country. It also serves as a research library. The library has the collection of 5 million volumes. Its collections relate to all fields of knowledge. In particular, it collects and catalogs materials published in and pertaining to Serbia. The main emphasis of the collection is preservation of the past and promotion of the cultural heritage. The library is also a central point for the deposit of international documents (of the World Health Organization, UNESCO, European Council, Organization for Security, and Cooperation in Europe). The library prepares both retrospective and current national bibliographies. It also maintains the union catalog.

After the democratic changes in 2000, the library tried to enhance its international activities, and the Center for International Cooperation gained a more prominent role. The National Library is cooperating with other national libraries. It is a member of International Federation of Library Associations, Conference of Directors of National Libraries, Conference of European National Libraries, European Bureau of Library, Information and Documentation Associations, Consortium of European Research Libraries, and Ligue des Bibliothèques Européennes de Recherche (LIBER).

Although, the library’s main goal is to preserve accomplishments of the nation, its new and very important role is to help in building new democratic society by educating and informing the people of Serbia. Since this new mission includes building and promoting democracy and helping economic, social, and cultural revival of the country, a few new projects have been initiated to fulfill this goal. One of them has already been mentioned, the

KOBSON network for cooperative acquisition of print and electronic scientific journals. The library also took a leading role in reintroducing the cooperative cataloging efforts, which were halted in the 1990s. In 2003 it initiated project Virtual Library of Serbia,^[11] the aim of which is to connect all online catalogs of libraries in Serbia. At the moment 91 libraries participate in this project.

In addition to the other functions, the library is a thriving cultural institution, offering film screenings, concerts, book readings, and exhibitions. It is also the center for professional library training. In its regulative role it gives accreditation to librarians and decides on rank and title given at promotion. It oversees public libraries in the country. It takes an active part in drafting and proposing laws pertaining not only to libraries, but to broader issues such as the book trade. By taking a visible role in the society, the library also promotes the profession of librarianship.

The library is active in the library community. It hosts information on the professional association on its Web site. It also provides information on accreditation, exams, continuing education classes, workshops, seminars, and talks. The library presents a number of awards annually to libraries, librarians, and authors. It publishes two journals and books on library and information science.

The Digital National Library of Serbia^[12] has since 2003 grown to over half a million of digital documents organized into 70 collections. Ten collections are available through the European library portal,^[13] while four collections are Open Archives Initiative compatible. One of the earliest projects was the Serbian Children's Digital Library,^[14] which contains digital copies of 127 most notable Serbian children's books. The publishers granted copyright to post full-text in the form of scanned books.

Public Libraries

After World War II, public libraries were established in increased numbers as the result of government initiatives. Public libraries in Serbia serve four main functions: they provide for education-information needs of the people and they provide for their cultural and recreational needs. Another important activity performed by public libraries is the creation, development and, more recently, the digitization of local history collections. As of the end of 2005 there were 160 registered public libraries, 25 of which were central.^[15] The legal status of public libraries is regulated by the Civil Service Act of 1991 and the Library Law of 1994. The public library is defined as an independent cultural institution established and funded by local municipalities. In 2007 public libraries had the professional staff of 1507. In 2006 they had 457,182 members, which is 6.10% of the entire population.^[16] In order to help update library collections, in 2006 the Ministry of Culture purchased and distributed 62,082 books to all public libraries.

Public libraries have a lively programming activity. The most popular programs are exhibits, promotions of books, lectures, and round tables with wide range of topics.^[17] A good example is a series of talks, lectures, and round tables of interest to a local community and a society in transition under the name "Tea on Thursdays at 6 P.M.," held in Jagodina Public Library in 2002 and 2003. This project was supported by the Fund for an Open Society as an example of a project that affirms libraries as centers of local communities. Public libraries also publish 14 titles of professional journals and magazines.^[18]

Belgrade City Library^[19] is the largest public library in Serbia. It was founded in 1929 and opened to public in 1931. In 1961 it became the central library for municipal libraries in Belgrade. It was the first public library in the country to implement an automated library system in 1987. Today, it has 14 different departments and divisions and coordinates a network of 13 municipal libraries and their branches covering 77 locations throughout the city. According to the 2007 Belgrade City Library network annual report, the staff of 300 served the population of close to 1,300,000 by managing the collection of close to 1,800,000 items. As the central public library in Belgrade, it serves in an advisory capacity, arranges exhibits of domestic and foreign books, arranges meetings with writers, and promotes lectures and discussions about new books.

Academic Libraries

The first institution of higher education in Serbia was the Serbian Lyceum founded in 1844. In 1863, the Lyceum transformed into a college, "Velika škola," and in 1905 into the University of Belgrade, absorbing the faculties of Philosophy, Law, and Technology. The Medical School, Faculty of Theology and Faculty of Agriculture were founded in 1919 and the Veterinary School in 1936. In 2008 the University of Belgrade had 2800 faculty and 90,000 students in its 31 faculties (separate legal entities within the university) and eight institutes and centers. Other major universities are University of Fine Arts, University of Novi Sad, University of Niš, and University of Kragujevac. Higher education in Serbia is undergoing major reforms in order to comply with the Bologna Declaration, the aim of which is to create the common European higher education system by making academic degree standards and quality assurance compatible throughout Europe.

Academic libraries differ from other libraries in that they belong to two systems: that of higher education (overseen by the Ministry of Education) and that of national library network (overseen by the Ministry of Culture). Academic libraries help universities fulfill their research and education functions. There are two models of academic libraries within the university, which is made up of separate legal entities, faculties, such as Faculty of

Law, Faculty of Philology, etc. Some faculties have central libraries, while the others have a large number of department libraries. Departmental libraries are created to better meet the specific needs of their users through the development of specialized collections and the types of services they provide. Department libraries are staffed with librarians with the appropriate subject background, usually holding the degrees from the departments they serve. In 2005, academic libraries had the professional staff of 509. Since most academic libraries are department or faculty libraries it is not surprising that 46% of academic libraries were one-person libraries, 29% of the libraries had staff of two, 18% had the staff of three or four, and only 8% had the staff of five or more.^[20]

The legal status of academic libraries is governed by The Library Law, the University Law, and the Law on Scientific Research, as well as the statutes of their parent institutions. Libraries are also subject to the Cultural Property Law, Press Law, and Civil Service Law. According to the Library Law, minimum requirement for an academic library are a collection of at least 3000 volumes and one librarian. The newly founded academic libraries need to be funded by not less than 7% of their institution's budget for the first 5 years of their existence and 5% afterwards. All academic libraries receive depository copies of doctoral dissertations and master theses from their parent institutions.

The University Library "Svetozar Marković" in Belgrade^[21] is the largest university library in the country and the central library of the University of Belgrade and Art University of Belgrade as well as the central library for all libraries in institutions of higher education and special libraries in research institutes in Central Serbia.^[22] The network includes three central University libraries, 119 libraries at faculties and colleges and 98 libraries in

research institutes. As of 2007 the University Library had the staff of 96 and a collection of over 1.5 million volumes. The forerunner of The University Library "Svetozar Marković" in Belgrade was the library of the Serbian Lyceum. However, with the foundation of the University in 1905 the library was disassembled and the collection divided among a number of university institutes and the National Library. The library was reestablished in 1921, as the University Library. In 1926, through Carnegie funds, the new library building was constructed and the library regained its stature. It was the first purpose built library building in Serbia. The building is still being used (Fig. 2). After World War II the library introduced contemporary international methods and standards in the organization of the collection. Together with the National Library of Serbia it created Rules for cataloging which signified the beginning of collaborative cataloging efforts in Serbia. In 1977 the University Library became the central library for all libraries in institutions of higher education in Central Serbia. In 1987 the University Library became the center of the university information system. The library automation started in 1988, and its Web site came online in 1996.

Unlike specialized departmental and institute libraries which collect in their specialized areas, the University Library collects general works from all areas of science with an emphasis on social science and humanities. It is the depository library for all the doctoral dissertations granted in Serbia. The library also has a special museum-gallery with folk literature department, an archival collection of personal correspondence of prominent individuals from the seventeenth till the twentieth century, and a collection of old geographic maps and atlases.

There are two other central academic libraries: the Matica Srpska Library in Novi Sad for the libraries on the territory of the province of Vojvodina and the University

Fig. 2 The University Library Svetozar Marković in Belgrade.

of Priština library for the libraries on the territory of the province of Kosovo. The Matica Srpska Library is the first Serbian public and scientific library. With the establishment of the University of Novi Sad, the Matica Srpska Library^[23] became the university library in 1960 and the central library for all academic libraries in province of Vojvodina. The Matica Srpska and its library were founded in 1826 in Budapest (Hungary), but the library was not opened to the public until 1838, when a wealthy citizen, Sava Tekelija, donated his collection of 4000 volumes; at that time it was known as Tekelianum. The library's holdings were further enriched through gifts, exchanges, and purchases. The first Serbian current bibliography was begun in the library in 1842. Throughout this period the library was located in Budapest except during the 1860s when it was transferred to Novi Sad where it remained till 1875. The library was finally moved to Novi Sad after World War II. The library automation started in 1989. In 2008 the library had the staff of 150 and a collection of over 3 million volumes. It has the largest collection of Serbian books from the fifteenth to the eighteenth century and the richest collection of the Serbian periodicals from the eighteenth and the first half of the nineteenth century. The University of Novi Sad had 1610 faculty and 43,259 students in 2007. In 2003 the University founded the Central Library of the University of Novi Sad.

The University of Niš was founded in 1965. Today, it is organized into 12 faculties with over 1400 faculty and 27,000 students.^[24] The network of academic libraries in Niš consists of the University library "Nikola Tesla," founded in 1967, and 19 academic libraries. The University library Nikola Tesla has the collection of 80,000 books and 1200 titles of periodicals in print.

The University of Kragujevac Svetozar Marković was founded in 1976. Today, it is organized into 11 faculties and three centers with 600 faculty and 12,000 students. The network of academic libraries at the University of Kragujevac has the University library, founded in 1977, and 14 academic libraries. The University library has over 100,000 books and over 500 periodical titles in print.

In 1976 University of Belgrade Libraries Association was founded to help coordination among all the libraries of the university, however, it ceased to exist in the 1980s. In 1992, a new effort for better coordination resulted in the foundation of the Serbian Academic Library Association.^[25] Its members are libraries from all six public universities, as well as the libraries of major research institutes. The association publishes two journals *Visokoškolske biblioteke* and *Infoteka: Časopis za informatiku i bibliotekarstvo*.

Special Libraries

According to the current Library Law special libraries are organizational units serving library functions within other organizations. In 2003 there were 228 registered special

libraries. However, it can be claimed with certainty that the actual number is larger than that. In 2003 special libraries had close to 2.5 million volumes. The average special library collection is fairly small, around 10,000 volumes. The libraries had professional staff of 257.^[26]

One of the largest special libraries is the Library of the Serbian Academy of Science and Arts.^[27] The Serbian Academy of Science and Arts grew out of the Serbian Learned Society (1841) and the Serbian Royal Academy (1886). The library's collection started as a gift from Dimitrije Tirol, one of the first members of the society. Until 1952 the library was closed to the public, and only the members of the academy had access to it. Today the library is open to all researchers. With the collection of around 1.3 million volumes it is the fourth largest library in the country. It has a valuable collection of old and rare books with over 3000 titles. It also has a collection of 10,000 photographs of individuals active in the scientific and cultural life of the country in the nineteenth and twentieth centuries.^[28]

In 2002 with cooperation with The Council of Europe, The Organization for Security, and Cooperation in Europe and Fund for an Open Society, the National Library of Serbia opened the Center for Law Information. The center is organized as a special collection within the National Library. It is an open stacks collection of official documents with the aim of making it available to wide audience. At the same time it serves the information needs of the legal professionals, members of the parliament, and law scholars by providing comprehensive legislative information pertaining to Serbia, Europe and the international law. A similar center was opened at the University library "Nikola Tesla" in Niš.

School Libraries

School librarianship emerged and developed professionally since 1945. In 1974 Law on the Elementary School stipulated that every school must have a library with the collection consisting of at least 2500 books. Under the current laws each elementary and high school is to have a library. School libraries today are subject to both laws on education and laws on libraries, where laws on education have primacy. There are 1342 school libraries in Serbia: 980 elementary school and 362 high school libraries.^[29]

Larger school libraries developed into efficient media instructional centers. In 2006 the average elementary school library in Serbia had the collection of close to 9000 volumes. Library collections in elementary schools are divided into two separate collections: for students and for teachers. High school libraries have one collection for both students and teachers.

Among the major problems of school libraries are the lack of funds for the adequate development of the collections and the lack of permanent professionally trained staff. Prior to 2005 school library staff did not have to pass

the state professional library exam if they passed the state professional teaching exam. Now school library staff needs to pass an exam for school librarians organized by the Ministry of Education.

LIBRARY EDUCATION

The first legal act to regulate library appointments was issued in 1928, requiring a civil service examination for the employment in the National Library. The requirements of this law were extended in 1929 to positions in the University Library in Belgrade.

Professional status for most library positions is attained primarily through a system of state professional examinations. These exams also serve as a form of continuing education. There are exams for librarians, senior library assistants, and library assistants. The exam is taken after at least 9 months at a position (for high school diploma holders) and a year at a position (for the associate and college degree holders). The exam must be taken during the first 3 years of employment. The exam consists of seven parts: 1) the constitution, library legislation, and legislation regarding preservation of old and rare books; 2) introductory knowledge of library science; 3) alphabetical catalog; 4) subject catalog; 5) introduction to information science; 6) introduction to bibliography; and 7) history of book, script, and libraries. Seminars for the preparation of the exam are organized by the National Library. Exams are held twice a year in the National Library in Belgrade and Matica Srpska Library in Novi Sad, the examiners are a committee appointed by the Ministry of Culture.

In 1948 the country's first library school, Secondary Library Science School, was founded in Belgrade marking the beginnings of regular library education. The school trained students for library assistant positions until it closed in 1979.

In 1962 at the Faculty of Philology (University of Belgrade), the department of library science was established offering an undergraduate degree. However, the department was closed after only two cohorts graduated.

The next attempt of bringing library education to universities was the establishment of interdisciplinary four-semester program for juniors and seniors from all the departments of the Faculty of Philology (University of Belgrade) in 1980. The courses included an introduction to library science; the organization of libraries; cataloging; bibliography; and the history of books and libraries. The program ceased to exist in 1990, when the Faculty of Philology University of Belgrade established the Department of Library and Information Science. The department offers undergraduate and graduate degrees. The department also offers the post-undergraduate certificate for school and special librarians. After the adoption of the

Bologna Convention, the department introduced new classes on research methods, archives, and museology.^[30]

The main institution of the continuing education for libraries is the National Library. The Educational center of the National Library offers Co-operative Online Bibliographic System and Services education, state exam preparation and different seminars and courses. University of Belgrade Library "Svetozar Marković" also organizes different lectures, seminars, courses, and workshops. Other institutions offering continuing education opportunities are the Department of Library and Information Science at the University of Belgrade, Matica Srpska Library, Serbian Library Association, and Serbian Academic Library Association.

ARCHIVES

Archival collections in Serbia began to develop throughout the country after 1918 and expanded after 1945. The Archives of Serbia was the only institution of this kind to exist in Serbia prior to 1918. Preservation of archival material in Serbia is regulated by the Cultural Property Law adopted in 1994. The Decree on the division of archival jurisdiction determines a geographical division of 34 archives within Serbia (20 in Central Serbia, five in Kosovo, and nine in Vojvodina). In addition to archives organized on the geographical jurisdiction, there are specialized archives (military, film, corporate, etc.) as well as in-house archival departments.

The contemporary Serbian archives network is comprised of the Archives of Serbia as a central archives, two provincial, 30 intermunicipal, and four city archives. The Archives of Serbia^[31] was founded in 1900. It holds records from 512 institutions in Serbia, from Serbian government, from social and political organizations, and also from the University of Belgrade. It also holds records from companies, societies, associations as well as notable individuals. Today, it is responsible for archiving records produced by over 70 institutions. The archives signed an agreement with the Serbian Orthodox Church and The Ministry of Culture to preserve the clerical documents from 1830 onward.

The Archives collects records from the nineteenth century onward. There is only one older collection and some individual documents. The oldest record is *Dečanska povelja* from 1330. The archives has 937 major collections and 48 smaller collections.

The Archives is responsible for education of archivists by offering various courses. There is an exam at the end of each course, which has the character of the professional state exam. Since 1957 archive courses covering a variety of topics have been taken by 700 archivists. In 2008 the Archives started summer archives school. The Archives publishes the professional journal *Arhivski pregled*.

The Archives of the Serbian Academy of Science and Arts^[32] began its work in 1841, but became an independent institution in 1952. The main mission of the archives is to collect records relevant to the history of the Academy and the history of Serbian people. The archives contains administrative documents of the Serbian Learned Society (1864–1892), Serbian Royal Academy (1887–1944), and two defunct institutes (Institute for the study of literature (1947–1954) and The institute for the study of villages (1948–1954). It also has minutes from the Serbian Academy of Science and Arts meetings as well as the meetings of its various bodies. The archives has four collections of documents: rare book and manuscript collection (collection of Serbian manuscript books and old print books from the thirteenth to the nineteenth century); historical collection (the largest collection with 15,071 signatures covering the medieval to modern period); ethnographic collection (collection of folk literature and ethnographic material from all parts of Serbia from the nineteenth and the twentieth centuries); and the oriental collection (collection of manuscript and print books in Turkish and Arabic from the fifteenth to twentieth centuries).

Besides the main archives in Belgrade, the Serbian Academy of Science and Arts also has archives in Sremski Karlovci. This archive has over 3 million records arranged in 44 fonds and 10 smaller collections covering the period from the mid-sixteenth century to the 1970s. This archive also contains documents important for the understanding of the political, cultural, and economic history of Serbs in the Habsburg Monarchy, with particular emphasis on churches and religious life, schools, education, literature, and arts. The first inventory for this archive was created in 1719.

Yugoslav Film Archives^[33] is the national film archives founded in 1949. The archives today includes a museum and a library. In 1951 it became one of the founders and permanent members of The International Federation of Film Archives. The archive collects and preserves films and accompanying film material, photographs, posters, advertising material, documentation, props, and old equipment. The archives can be used by researchers of film and film theory. It takes an active part in educating general public and promoting film culture by organizing film screenings, lectures, round tables, and exhibits. The film collection has over 85,000 film copies, 80% of which are international. It also has a collection of documentary films pertaining to former Yugoslavia from the oldest film, *The 1904 Coronation of King Peter I*, up through the breakup of the country in 1992. It also has a valuable collection of Yugoslav movies, containing 90% of the entire production of former Yugoslavia since World War II. The library has over 21,000 books. Of special importance is the collection of scripts, scenarios, and dialog lists. The museum has a special theater that regularly shows films from its collection. In 2006 a small 18-seat theater was opened for digital media projections.

Historical Archives of Belgrade^[34] was founded in 1945. Together with the Mathematical Institute of the Serbian Academy of Science and Arts, the archives is developing an archives description program based on application of the International Standard for Archival Description (General) [ISAD(g)] and the Document Type Description for the Encoded Archival Description. The Historical Archives also translated and made available archival metadata standards ISAD(g) and the International Standard Archival Authority Record for Corporate Bodies, Persons, and Families. The archives also translated and made available all resolutions of the International Council on Archives (1994–2007).

MUSEUMS

Churches and monasteries have large collections of valuable art objects. The oldest of these is the collection at the Serbian monastery Hilandar on Mount Athos in Greece from the beginning of the twelfth century. The first museums were founded as the result of initiatives taken by prominent Serbs. In the period between 1900 and 1945 numerous specialized museums (such as ethnographic, education, and military) as well as art galleries were opened. Altogether some 70 museums were founded. Unfortunately, many museum collections were partially or completely destroyed during World War II. The oldest gallery in Serbia is Matica Srpska Gallery in Novi Sad, founded in 1847 and opened to public in 1933.

Today, museums function within the legal framework of the Cultural Property Law.

The major professional association is Serbian Museum Association,^[35] established in 2001. It continues the tradition of the previous association founded in 1962. The association has both individual and institutional members interested in the advancement of museology and museums. The association installs an annual award to the best museum and the best curator.

The National Museum

The National Museum Belgrade,^[36] founded in 1844, is the oldest and most important museum in Serbia (Fig. 3). It initiated the first archeological excavations in Serbia in 1865 and started collecting world art in 1891. Today, the museum is the central institution in the museum network of Serbia. It is also a central museum for archeological, numismatic, and art collections dating before 1900. It is the central institution for the preservation of cultural property.

The museum has 34 archeological, numismatic, art, and historic collections. Its goal is to preserve, interpret and promote cultural heritage of Serbia and its neighbors. Apart from the archeological collection, the museum also has 1700 Serbian paintings from the eighteenth and

Fig. 3 The National Museum in Belgrade.

nineteenth centuries; 3000 Yugoslav paintings from 1889 to 1999; and international collection of 1100 mainly European paintings and sculptures from fourteenth to twentieth century. The museum holds Miroslav Gospel, the first preserved Serbian Cyrillic manuscript dating from around 1180 with miniatures of outstanding beauty. It has been registered in UNESCO's Memory of the World program in 2005.

In 1957 the museum opened new conservation lab. In 1997 it founded the school for conservation "Dijana." The school is now department for preservation and conservation.^[37]

The museum has extensive educational activities. It organizes museum workshops for group visits by kindergarten and elementary school children. It also has guided tours and lectures for high school and college students.

In 1933 the museum started publishing the journal *Numizmatičar* and in 1937 the journal *Umetnički pregled*. Today, it publishes five journals: *Zbornik Narodnog muzeja u Beogradu: Arheologija*, *Zbornik Narodnog muzeja u Beogradu: Istorija umetnosti*, *Numizmatičar*, *Glasnik Društva prijatelja Narodnog muzeja u Beogradu*, and *Diana: Odeljenje za preventivnu zaštitu Narodnog muzeja u Beogradu*.

Art Museums and Galleries

The Museum of Applied Arts in Belgrade^[38] was founded in 1950. The museum has over 35,000 artifacts. It is a central museum for the applied arts in Serbia. It has collections of jewelry, textile, costume, furniture, photography, glass, architecture, and modern applied arts.

The Museum of Modern Art was founded as a Modern Gallery in 1958. The museum collects and preserves Yugoslav artwork dating since 1900. The museum

researches new methods in the area of visual culture, history, and theory of art. It has the collection of paintings from 1900 to 1945; the collection of paintings after 1945; collection of sculptures; collection of prints; and the collection of new art media (photography, film, video, etc.).

The Museum of Naïve and Marginal Art in Jagodina^[39] was founded in 1960. It contains about 2500 artworks from about 280 painters and sculptors. The museum organizes naïve art colonies and biennials.

The Gallery of the Serbian Academy of Science and Arts was opened in 1968. It is an organizational unit within the Academy. The gallery collects and preserves art objects owned by the Academy. It has paintings, prints, and sculptures of some 270 artists, 50 of them Academy members. The gallery organizes various art, science, and culture exhibits, public lectures, regular concert program and has a lively publishing activity. The gallery is funded by the academy, i.e., The Ministry of Science, Technology and Development. Some projects are funded by the Ministry of Culture, and the City of Belgrade Committee on Culture.

Science Museums and Galleries

The Natural History Museum,^[40] founded in 1895, is one of the oldest museums and one of the oldest specialized scientific institutions in Serbia. It is the only natural history museum in the country, and with the collection of 1.5 million objects it is one of the largest natural history museums in southeastern Europe. Before the foundation of the museum, in the first half of the nineteenth century, a large number of natural history artifacts was held in the Lyceum. The first exhibit in the Museum was held in 1904 with the king present at the opening. The same year museum participated in the World Fair in Paris. During

World War I and World War II, parts of the collection were damaged or destroyed, including the museum archives and parts of the library. Today, the museum has 118 collections. It is one of the few museums in Serbia having a scientific research department. Its education department collaborates with numerous schools in Belgrade and Serbia. The museum also has a special library, one of the oldest scientific libraries in the country, founded in 1903. The museum has been publishing a scientific journal from 1948 to 1998. In 2008 it started publishing a new journal *Bulletin of the Natural History Museum in Belgrade*. The museum has also started the digitization project.

The Science and Technology Museum^[41] was founded in 1989. The mission of the museum is the preservation of scientific and technological heritage in Serbia. Museum aims at popularizing science and enhancing scientific and technological culture by collecting, researching, preserving, and exhibiting objects related to science and technology.

The Science and Technology Gallery of the Serbian Academy of Science and Arts was founded in 1988, and started having exhibits in 1997. From 1997 till 2005 the program of the gallery, including exhibits and lectures was handled by the Science and Technology Museum. The gallery started organizing its own programs in 2006 with the emphasis on the history of science and technology in Serbia. The mission of the gallery is popularization of science and technology. The Gallery is also home to the Science and Technology Museum's special library.

The Nikola Tesla Museum^[42] was founded in 1952. The museum holds personal documents and belongings of Nikola Tesla, making it the most significant institution for the study of life and work of this famous inventor. It has over 160,000 documents, over 2000 books and journals, 1200 historical technical artifacts, 1000 blueprints and drawings, and 1500 photographs and photographic plates of the original instruments. The museum has Nikola Tesla Archive, a unique collection of manuscripts, photographs, and scientific and patent documentation. The archive was registered in UNESCO's Memory of the World program in 2003. The museum also has Tesla's personal library with 786 book titles, 323 titles of periodicals, and about 70,000 newspaper clippings.

The Science and Technology Museum initiated the foundation of the Science and Technology Museum Association of Serbia in 1991. Through this association the museum coordinates 16 museums and collections in Serbia, including the Automobile Museum, the Aviation Museum, the Mining Metallurgy Museum, the Serbian Medical Museum, the Natural History Museum, the Agricultural Museum, and the Serbian Railway Museum. One of the accomplishments of the association is the creation of standards for processing technical cultural assets. As of 2003, the association started publishing a newsletter *NAVOJ*. Its primary goals are improving the cooperation among

museums, contributing to the development of the profession, and informing expert and general public of the work that is being done for the protection of the technological heritage of Serbia.

Historical and Ethnographic Museums

The Historical Museum of Serbia was founded in 1963 to collect and preserve historical artifacts related to the economic, political, and cultural history of Serbia.

The Ethnographic Museum^[43] was founded in 1901. It has been collecting artifacts from Serbia and the Balkans. In 1926 it started publishing the journal *Glasnik Etnografskog muzeja* which is still published today. The museum has one of the richest ethnographic libraries in the Balkans. It has an active educational unit and conducts ethnographic research. It also organizes workshops to teach the traditional crafts. Since 1992 the museum has been organizing the International Festival of Ethnographic Film.

CONCLUSION

Because of its location at the crossroads, Serbia was for centuries shaped by the cultural boundaries between the East and the West. Its cultural and information institutions shared its tumultuous history. Periods of greatness and prosperity were followed by periods of devastation. Throughout the history, wars would decimate the country's printed and cultural heritage and the institutions preserving that heritage. But, the institutions would soon rebuild and consolidate themselves and move forward. Such a history left the country constantly torn between striving for modernization and preserving its traditions and cultural heritage.

Present-day institutions started to be developed only in the midnineteenth century when the conditions became favorable for the systematic development of education and the establishment of cultural and scientific institutions. Chief intellectual influence for the development of these institutions came from the Western Europe, introduced to Serbia by the Serbs living in the Habsburg Monarchy. Thus, its first reading rooms were based on the models from Western Europe and the first library catalog in the National Library followed Austro-Hungarian regulation. The first libraries and museums were not result of an organized state policy, although the state supported them financial and developed appropriate legislation relatively early.

Much greater involvement of the state came during the communist rule after World War II. During that time Serbia organized a countrywide system of central libraries performing coordinating functions which is still in place. The system provides libraries greater visibility, streamlined funding, and more clout. It is also conducive to

larger projects such as the reintroduction of cooperative cataloging through the Virtual Library of Serbia project or cooperative acquisition of scientific periodicals through the KOBSON project. In recent years Serbian libraries have increased cooperation with Western European countries.

APPENDIX

Table A.1 Timeline of Major historical events

Seventh century	Serbs, a Slavic people, settled the Balkans
Ninth century	Serbs adopted Christianity
Ninth century	Cyrillic alphabet introduced
Thirteenth century	Serbia became a kingdom with an autonomous Orthodox church
Fourteenth century	Serbia fell under the Ottoman Rule
1493	First Serbian printing office opened in Cetinje (Montenegro)
1494	First book printed in Serbian language
1690	Great migration of a part of Serbian population to Habsburg Empire
1768	First Serbian magazine published in Venice (Italy)
1791	First Serbian newspaper published in Vienna (Austria)
1808	Velika škola, the first higher education institution, was opened in Belgrade
1814	First grammar of the reformed language, <i>Pismenica</i> , by Vuk Karadžić was printed in Vienna (Austria).
1823	Srpska velika gimnazija (Serbian High Gymnasium) founded in Novi Sad
1825	First literary magazine, <i>Serbski letopis</i> , started in Buda (Hungary)
1826	Matica Srpska founded in Pest (Hungary)
1827	First bindery and bookstore opened in Belgrade
1830	Serbian principality granted a fully autonomous status by the Ottoman government
1831	State Printing Press established in Belgrade
1832	National Library founded; Legal deposit for the National Library introduced; First Serbian book printed by the state printing press in Belgrade
1834	First newspaper published in Serbia
1838	Licej Kneževine Srbije (Serbian Lyceum) founded
1842	Serbian Library Association founded; First Serbian current bibliography begun at Matica Srpska Library; Serbian Learned Society (Društvo Srpske Slovesnosti) founded; Library of the Serbian Learned Society founded
1844	Library of the Serbian Lyceum founded; National Museum Belgrade founded
1846	Reading room (čitalište) in Belgrade founded; First scientific journal published by the Serbian Learned Society
1847	Matica Srpska Gallery in Novi Sad founded

(Continued)

Table A.1 Timeline of Major historical events (Continued)

1853	First official librarian, Filip Nikolić, appointed in the National Library
1860	First private printing press opened
1867	Vuk Karadžić's new simplified orthography officially accepted
1869	First bibliography produced
1870	First Press Law
1871	Law dividing the National Library and the National Museum into separate institutions
1878	Serbia's independence from the Ottoman Empire recognized at The Congress of Berlin
1881	First law on The National Library
1891	Ministry of Education arranged interlibrary loan exchanges between the college library in Belgrade and the Court Library in Vienna
1895	Natural History Museum founded
1898	Law on the State Archives
1900	Archives of Serbia founded
1901	Law on the National Library and The Rules on Internal Organization and Work in the National Library; Ethnographic Museum founded
1918	Serbia joined the Kingdom of Serbs, Croats, and Slovenes
1928	Legal act to regulate library appointments requiring a professional examination for the employment in The National Library; National Library started producing the current national bibliography
1929	Kingdom of Serbs, Croats and Slovenes changed name to the Kingdom of Yugoslavia
1930	First union catalog of the University of Belgrade libraries created
1938	International standard format cataloging cards introduced
1940	Library journal, <i>Glasnik narodne biblioteke</i> , started being published
1941	National Library completely destroyed in German bombing
1945	Historical Archives of Belgrade founded
1946	Federal People's Republic of Yugoslavia proclaimed. Monarchy abolished
1947	Library Association of Serbia founded
1948	First library science degree program, Secondary Library Science School, founded in Belgrade
1949	Yugoslav Film Archives founded
1953	Library center (to become Department for the promotion of library services) founded in National Library
1958	Museum of Modern Art opened
1962	First undergraduate degree program in library science established at the University of Belgrade
1963	Name of the country changed to Socialist Federal Republic of Yugoslavia
1974	National Library started using UDC
1976	National Library accepted new international standards for bibliographic description, ISBD
1987	National Library started Cataloging-in-Publication service for monographs; Belgrade City Library implemented automated library system

(Continued)

Table A.1 Timeline of Major historical events (*Continued*)

1989	National Library started using the online catalog for all new acquisitions; Science and Technology Museum founded
1990	Department of Library and Information Science at the Faculty of Philology University of Belgrade founded
1991	Science and Technology Museum Association of Serbia founded
1992	Slovenia, Croatia, Bosnia and Herzegovina, and Macedonia gained independence from Yugoslavia
1992	Serbian Academic Library Association founded
1996	National Library established Internet access as well as its first Web site
1999	NATO bombing campaign; U.N. Administration of Kosovo
2001	Consortium of the libraries in Serbia for Cooperative Acquisition (KOBSON) formed
2003	National Library started Cataloging-in-Publication service for serials
2004	National Library became National ISSN center
2005	Association of Central Libraries of Serbia formed
2006	Serbia and Montenegro dissolved their union and became independent states

Serials Collection and Management [ELIS Classic]

Sarah Sutton

Mary and Jeff Bell Library, Texas A&M University-Corpus Christi, Corpus Christi, Texas, U.S.A.

Abstract

This entry discusses the selection and management of serials in libraries. It provides an overview of the process of serials collection and management as well as current issues and controversies. Relevant definitions are provided as well as a brief history of serials management. Focus is on recent developments (standards, technologies) and their impact. Selection, acquisition, access, processing (including cataloging), maintenance, preservation, and weeding of serials in all formats are covered and important players in each process are identified.

INTRODUCTION

Serials are publications that are characteristically issued in discrete, separate parts without a predetermined date on which publication of successive issues will conclude. The parts are commonly differentiated from one another by numerical or chronological designations. Serials exist in the middle of the hierarchy of related terms; they are a type of continuing resource and encompass periodicals. These characteristics differentiate serials from other types of publications and are at the heart of the challenge that their collection and management presents to libraries.

The process of collecting and managing serials is cyclical rather than linear. Serials management is an open system subject to outside influences. Budgets set outside the library, technology, and in particular, changing users and user preferences directly impact what and how a library collects. Selection and management activities mirror the users' information seeking activities as is depicted in Fig. 1. The users' process is depicted in the inner cycle. An information need is identified and leads to information seeking and identification. Information identification can lead the users to the identification of new information needs or to obtain the identified information. Information obtained is used to create new information and/or for the identification of additional information or information needs. The outer cycle reflects (albeit simplistically) the cycle of serials information management. Serials are selected, acquired, and processed before they are made accessible to the user. Maintenance of serials requires both additional processing of issues that continued to be received over time as well as preservation of existing issues. Periodic weeding is often required as items to be preserved or discarded are identified. Selection is based on the users' information needs. Acquisition, processing, and the provision of access to serials support the users' information seeking and identification, and allows them to obtain information. Some but not all users will use

the information they obtain to create new information which may then be selected for inclusion in the library collection.

This entry is organized on the basis of the cycle of serials management presented in Fig. 1. Issues and controversies among members of the serials information chain will be noted and explained as they arise in the text. For the most part, electronic serials are not dealt with separately but rather discussion of them is included in the discussion of the processes of serials selection and management, again with differentiations noted as needed. Although the introduction of electronic formats caused upheaval in the world of librarianship during recent decades, we have since, to some extent, become accustomed to rapidly changing formats; certainly they have become ubiquitous to users. Thus the focus should not be on formats alone but on the processes of selection and management with notation of the upheaval, etc. where it has recently been the greatest.

DEFINITIONS

A discussion of serials collection and management should begin with the precise definition of terms to be used in the discussion. Although often used interchangeably, definitions of the terms serial, periodical, and continuing resource are in fact different and hierarchically related to one another. The International Organization for Standardization (ISO), the body that assigns a unique International Standard Serial Number (ISSN) to serial publications, defines a serial as "a publication in any medium issued under the same title in a succession of discrete parts, usually numbered (or dated) and appearing at regular or irregular intervals with no predetermined conclusion."^[1] The National Serials Data Program (NDSP) defines a serial as "print or nonprint publications issued in parts, usually bearing issue numbers and/or dates. A serial is

Fig. 1 The cycles of serials management and the user information process.

expected to continue indefinitely. Serials include magazines, newspapers, annuals (such as reports, yearbooks, and directories), journals, memoirs, proceedings, transactions of societies, and monographic series.”^[2] These definitions as well as definitions of serials from other authoritative sources like the second edition of the Anglo American Cataloging Rules (AACR2) have in common a number of characteristics that differentiate serial publications from other types of publications, namely:

- Successive parts
- Typically differentiated from one another by numerical or chronological designations
- No predetermined date of termination^[2]

Serials exist in the middle of the hierarchy of related terms; they are a type of continuing resource and encompass periodicals. Continuing resources are defined in AACR2 as being “issued over time with no predetermined conclusion, including bibliographic resources issued successively in discrete parts and integrating resources into which updates are incorporated without remaining discrete. Examples include serials (periodicals, newspapers, etc.), monographic series, and updating loose-leaf services, databases, and Web sites.”^[2] The term periodical encompasses newspapers, popular magazines, scholarly journals, and trade magazines. They are, by definition, serials and thus share all of the characteristics of serials. They are usually intended to be published regularly (although in practice this may not always be the case).^[3]

Typically, a newspaper is printed on newsprint, published daily or weekly,^[2] and contains editorial comment, regular columns, advertising, and/or cartoons. Popular magazines can often be distinguished by being printed on glossy paper and contain a larger proportion of advertising than other categories of periodicals (since much of their costs is covered by advertising) and subscription rates are typically low.^[2] Trade journals are usually intended for a specialized audience and often contain advertisements,^[2] book reviews and listings of employment opportunities. Scholarly journals contain few, if any advertisements and are devoted to publishing the results of original research. Research articles are usually peer-reviewed, that is, they are critiqued by a panel of experts before they are accepted for publication.^[3,4]

Although the physical form of periodicals has been used here as a distinguishing characteristic, almost all types of periodicals may also be published electronically. Serials published in electronic form are defined by the Library of Congress’s Cooperative Online Serials (CONSER) program and AACR2 as being delivered online via a network.^[1] It is important to note that other types of continuing resources are also often delivered online via a network and, in fact, this method of delivery is considered to be particularly effective for their timely delivery.

Almost every library’s collection includes serials but the type and number varies widely from one library to the

next. In general, public libraries collect fewer serials than do academic or special libraries. Public libraries spend far less of their budgets on serials (6% vs. 42% according to Black).^[2] They may collect a larger proportion of popular periodicals (magazines, trade publications, and newspapers) to scholarly journals. Academic libraries collect more scholarly journals and, often, more trade publications than public libraries although, of course, all library serials collections are based on the needs and interests of their users. Scholarly journals are usually more expensive than trade publications (sometimes a great deal more expensive), thus a larger proportion of an academic library's budget is spent on serials subscriptions. The extent of serials collecting by special libraries (for example, law libraries and corporate libraries) is more difficult to generalize since it will depend on the population the library serves.

HISTORY

A comprehensive history of serial publications itself is beyond the scope of this entry. In addition to an excellent but relatively brief review of the history of the serial provided in the second chapter of Nisonger's *Managing Serials in Libraries*,^[5] several useful and comprehensive books have been written on the subject including Davinson's *The Periodicals Collection*^[6] and Houghton's *Scientific Periodicals: Their Historical Development*.^[7] This section will focus on only the historical development of serials collection and management.

The first indexes developed at almost the same time as the first scholarly journal, around 1683 and the first abstracting service developed around 1830.^[5] A number of currently well-known indexes developed during the later nineteenth century and early twentieth centuries: Poole's index to Periodical Literature which was published from 1848 to 1907, H. W. Wilson's Reader's Guide to Periodical Literature which began publication in 1900, and Ulrich's International Periodicals Directory which was initially published under the name "Periodicals Directory: A Classified Guide to a Selected List of Current Periodicals Foreign and Domestic in 1932."^[5]

The late nineteenth century also saw initial forays into serials subscription management by agencies. Both the Faxon company (in the United States) and Blackwell's (in the United Kingdom) can trace their origins to this era. The earliest automated subscription services were introduced by Faxon and EBSCO in the 1980s.^[9]

Bibliographic control of serials was hugely advanced in the 1960s and 1970s with the development of the ISSN and the ISSN Network. The ISSN Network consists of centers throughout the world which are responsible for the assignment of ISSNs and key titles both of which are unique identifiers and are immensely helpful in differentiating serials with similar titles. ISSNs can be assigned to a serial in any format.^[5] In 2001, as the AACR2 chapter

dealing with serials was revised and renamed, ISSNs began to be assigned to continuing resources. In 2007 the standard for the creation and assignment of ISSNs was revised to include a linking ISSN or ISSN-L. The ISSN-L is a mechanism for bringing together the various formats in which a continuing resource may be published (each of which may have been assigned a unique ISSN). The ISSN-L is separate from the ISSN enabling it to be coded separately in metadata records. This provides for identification of a serial regardless of the number of different formats it is published in, by OpenURL services and in machine readable cataloging (MARC 21) records.^[8]

Additional events in library automation that impacted serials management include the development of bibliographic utilities, integrated library systems, and the Online Public Access Catalog (OPAC). Bibliographic utilities like Online Computer Library Center (OCLC) and Research Libraries Information Network (RLIN) in the United States and Auto-Graphics, Inc. in Canada provide their members with access to a database of bibliographic records which they can download, create, and modify and which rely on machine readable cataloging as well as recording serials holdings information which facilitates interlibrary loan.²¹ Noncomputer serials management systems were being developed in libraries as early as the 1940s but it would be the 1980s before computerized integrated library systems (ILS) would be developed. Initially this took place in libraries (mainly academic libraries). During the 1980s vendors like Readmore and Faxon began marketing their own ILS. Advances and widespread use of communication technologies like the Internet during the 1990s and 2000s provided libraries with greater and greater control over serials and all other library materials as well as for access to them through the OPAC.

SELECTION

Librarians, library staff members, and library users traditionally participate in serials selection either separately or through committees. The combination of selectors will vary by type of library (academic, public, special, etc.). In all cases, the users' needs are a primary selection criterion. Users may make their needs known directly, indirectly, or both. Direct communication of needs may occur through participation on selection committees or, as is often the case in academic libraries, through a program for faculty participation. Indirect communication of needs may occur through use which may or may not be formally measured.

Selection criteria related to user needs will reflect the mission of the institution and may include support for academic curricula and research, user interest, and relevance to the rest of the library collection. Additional selection criteria include access to the content through indexes, peer review of content (for scholarly journals), cost, anticipated level of use, publisher reputation, citation rates and

impact factors, physical quality, level of topical coverage in relation to existing subscriptions, type and frequency of requests, longevity, availability elsewhere, reviews, availability of desired format, inclusion in core lists, and available space in the library. The exact combination of criteria a library uses will vary by type of library and, often, within a single library over time. Some selection criteria are more universal than others, particularly format and cost.

Format. The increasing ubiquity of electronic serials in the twenty-first century makes selection decisions regarding format more complex. Prior to the development of technologies that make the delivery of serials in electronic format attractive to both users and librarians, serials subscriptions were delivered in either print or microform. Print subscriptions were generally preferred and microforms were selected based on the library's need to either conserve shelf space or to preserve content or both. Electronic subscriptions provide similar space-saving advantages to microforms and can be made accessible to patrons inside and outside of the library building virtually 24 hours a day, 7 days a week. However licensing agreements for electronic subscriptions rarely allow libraries to preserve content locally. This loss of control over content preservation has created a fear among librarians that electronically subscribed content may disappear. Thus, despite the advantages of electronic serials, a library may elect to purchase serials in print or microform rather than or in addition to an electronic version.

Advantages and disadvantages of electronic subscriptions also vary depending on the type of serials being considered. The preceding discussion focused on periodicals including scholarly journals. Additional advantages exist for purchasing continuing resources in electronic format, and, in fact, there is a trend away from publication of continuing resources in print. Continuing resources in print require substantial library staff time to remove discarded pages and replace them with pages containing updated information. Examples of this include legal materials, medical materials, and business materials, particularly stock, bond, market, and industry information. The processing time required to make these materials available in print (printing, mailing, as well as in-library processing) delays users' access to time sensitive information. These disadvantages are eliminated by making them available electronically.

Cost. Serials subscription costs became a point of contention between publishers and libraries during the 1970s and 1980s when increases in annual subscription prices began to rise at a rate above (sometimes far above) the rate of inflation. Conditions that contribute to these increases are generally accepted to be increases in the volume of published research; increases in the number of serial publications; fluctuations in the rates of foreign currency exchange; and market dominance, particularly in the fields of science, technology, and medical, of a few, profit-oriented publishers. Also contributing is the cycle of

subscription cancellations by libraries who can no longer afford a particular subscription, which results in publisher price increases made to make up for a smaller subscription base, which, in turn, results in another round of subscription cancellations by libraries, and so on. These conditions and the resultant rapidly increasing subscription costs are known as the serials crisis.

The serials crisis impacts academic and medical libraries to a greater extent than it does public libraries because more of their budgets are allocated to the purchase of serials. Academic libraries have responded by shifting funds previously earmarked for other types of library materials to their serials budgets. A 1992 study indicates that college library serials subscription expenditures increased from 31.13% of their budgets in 1973–1974 to 42.12% of their budgets in 1988–1989.^[1] The annual Library Journal Periodicals Price Survey (published in the April 15 issue each year) reports changes in periodicals prices and predicts changes for the upcoming year. Other sources of serials subscription price increases are available from the Association of Research Libraries and the Association for Library Collections and Technical Services (ALCTS) division of the American Library Association (ALA).

Most academic libraries and many public libraries develop collection development policies to guide materials selection including serials subscriptions. A serials collection development policy typically includes a list and description of approved selection criteria. Serials collection development policies may also include guidelines for the acceptance of gift subscriptions and serial back issues. An academic library is likely to describe levels of collecting by subject discipline in its policy as well as strategies for conserving shelf space like setting specific lengths of retention for periodical back issues and for selecting titles for preservation. A serials collection development policy may also address the issue of access to versus ownership of serials titles (also known as just-in-case vs. just-in-time), that is, it may contain a plan for selecting which titles are relevant enough to require individual subscriptions (ownership) and which are only tangentially relevant and for which access may be provided via document delivery services like interlibrary loan or via a full text electronic aggregation (access but not necessarily ownership).

ACQUISITION

Once a serial has been selected, the next step in its management is to purchase a subscription, to acquire it. In simple terms, an order for a new subscription is placed by the library with the publisher; the publisher is paid for the subscription and subsequently begins delivery of issues to the library. At the end of the subscription period, the subscription is either renewed or cancelled. Seldom, however, is the process really this simple.

To begin with, a library is likely to have multiple subscriptions. Small public or special libraries may have as few as 10 or 20 subscriptions while large research libraries may have tens of thousands of subscriptions. In addition to a small number of serials subscriptions, small libraries generally have small staffs and while large research libraries have larger staffs, it is easy to see how ordering, renewing, tracking receipt of, and issuing payments for multiple serials subscriptions can begin to take up a great deal of library staff time in any library. For this reason, many libraries choose to purchase the services of a subscription agent to handle these functions for the library.

A subscription agent will typically place orders, make payments, and cancel or renew subscriptions on behalf of the library. The library pays one bill to the subscription agent for multiple subscriptions plus a service charge to the agent. The agent sends the library a list of subscriptions once a year for them to approve subscription renewals and make cancellations. The agent will also alert the library to changes in their subscriptions, for instance, changes to titles, publishers, subscription rates, and publication delays and will take some of the burden of communicating with the publishers about claiming missed issues of print serials and resolving access issues to electronic serials. A subscription agent handling a large proportion of a library's subscriptions can provide the library with valuable reports describing patterns in, for example, cost increases, delayed publications, and/or claims sent and fulfilled.

Recently, in response to increasing serials costs, libraries have begun to collaborate in the purchase of bundles of periodicals. Consortial purchases benefit libraries by providing them with buying power that they would not have individually and allow them to provide their users with access to periodicals that they would not otherwise have. Subscription agents often play a part in consortial purchases by providing centralized management of the titles included in the bundles and customized billing to consortia members who may pay different percentages of the total cost of the bundle based on their institution's estimated usage of titles in the bundle or number of users or both. Publishers benefit from the agent's management of title lists and by receiving a single payment for the bundled subscription. Consortia and member libraries benefit from the management of institutional title lists (which may vary among the consortia member libraries) and by the agent's ability to customize billing to each member library.

The services of a subscription agent generally apply to subscriptions to print, electronic, and sometimes microform serials and are considered to be worth the service fees charged. Care should be taken in selecting a subscription agent. Criteria for selecting a subscription agent include the quality of services provided and the agent's reputation and financial stability. The importance of an agent's financial stability became clear in 2002 when the

divine/RoweCom/Faxon Library Subscription Service filed for bankruptcy leaving many libraries with paid but unfulfilled subscription orders.

PROCESSING

Check-In

Unlike monographic purchases, serials subscription purchases require constant tracking of receipt of multiple issues. This process is called check-in and occurs upon receipt by the library of each serial issue. In most libraries it is an automated process in which receipt of an issue is noted in the ILS where records of all of the materials owned by the library are stored and made available to users. Although check-in provides a record of receipt of materials purchased required by many institutions, there is some debate over whether check-in, particularly in the case of electronic serials, is worth the time spent on it by library staff. Some libraries have done away with check-in for serials issues in any format.

Check-in often alerts libraries to the existence of missing issues. Missing issues can then be requested directly from the publisher or from the publisher through the subscription agent. This process is called claiming. Claiming is often automated and conducted using the library's ILS. The ILS has the capability of creating a list or report of missing or late issues. The list can be printed and e-mailed or faxed to the subscription agent or publisher or it can be transmitted via electronic data interchange (EDI). EDI is a standard for structuring data so that it can be exchanged between computers quickly and efficiently. It is used by libraries and subscription agents for exchanging data required for claims as well as for prompt delivery of invoices.

Check-in also facilitates the provision of serials holdings information to users. Holdings information describes exactly which volumes and issues (or other parts) of a serial the library owns and/or provides access to. Also unlike monographic materials, libraries may provide multiple access points to serials. Holdings may be displayed in the OPAC but may also be displayed in separate lists. A current popular term for such a separate list is A-to-Z list, that is, a searchable alphabetical list of a library's or group of libraries' serial holdings. Another term for a list containing the serials holdings of two or more libraries is called a union list.

Cataloging

Although in libraries the term cataloging traditionally refers to the creation and maintenance of records containing bibliographic information in a library catalog (either paper or electronic) in order to provide access to the materials described in those records, maintaining

bibliographic information describing serials (and other materials) in A-to-Z lists, union lists, and link resolvers as well as the OPAC can be (and is) described as cataloging. Cataloging of serials in the traditional sense is accomplished by most libraries through importing bibliographic records from a national bibliographic database like the OCLC. The Library of Congress's Program for Cooperative Cataloging Cooperative Online Serials (CONSER) program provides standards for traditional serials and continuing resources cataloging. These are used in conjunction with the standards for cataloging of other materials (including serials and continuing resources) described in AACR2 and MARC 21.

During the late twentieth century, as library catalogs began to be automated, some libraries chose not to include bibliographic records for serials in the OPAC but rather to provide lists of serials titles to display holdings and to shelve periodicals in alphabetical order by title in order to promote finding.^[5] Advances in technology improved flexibility in OPACs and the emergence of electronic journals and the capability of OPACs to link to them have combined to make the inclusion of serials records in OPACs much more desirable and easily accomplished today. However, the question of whether or not to catalog serials lives on through the emergence of electronic journals and subsequent decisions required about ownership versus access.

Libraries in the early twenty-first century have the capability to make far more serials available to users electronically than they could in print and microform alone. The ability to purchase bundles of electronic serials either from publishers or from third party aggregators makes this possible. The time and staff required to catalog the much larger number of serials to which the library now provides access can be extensive. While catalog-ready MARC 21 records are often available for purchase with a bundle, some library resources are still required to download them and edit them to local standards. Libraries lacking the resources to purchase and process MARC 21 records for their electronic journal bundles often continue to elect to catalog in their OPACs only those journals to which they actually subscribe (as opposed to those to which they simply provide access).

Once the decision is made to include bibliographic records for serials in the OPAC, the library must determine the extent and level of cataloging. Libraries that shelve their print periodicals separately from the main collection and arrange them in alphabetical order by title may choose to catalog them to a lesser extent, with fewer subject headings and no classification numbers assigned, since neither are required in order to find the periodical on the shelf. Including classification numbers in periodicals' bibliographic records allows the library to arrange their print subscriptions in order by classification which has the advantage of collocating titles by subject (facilitating browsing) and either integrating them with the main

collection or not. This practice also allows the library to shelve more closely together periodicals that have undergone changes in title.

The fact that periodicals titles do change raises another issue with regard to cataloging. Until the first edition of the Anglo American Cataloging Rules (AACR) that was adopted in 1967, libraries used a method called latest entry cataloging to represent periodicals in their catalogs. In latest entry cataloging, all titles under which a single periodical has been published are integrated into a single bibliographic record which contains a complete history of the publication. The AACR and later, AACR2, calls for successive entry cataloging of periodicals. Successive entry cataloging requires the creation of a new bibliographic record for each new iteration of a periodical, for example, when the title or publisher changes. In successive entry cataloging, the new record is linked to the old record providing access to the title's publication history. Clearly, successive entry cataloging created the potential for large numbers of new bibliographic records. This was eventually seen to have resulted in too many new bibliographic records and the 2002 revision of AACR contained detailed instructions for catalogers regarding the differences between major title changes (when a new bibliographic record was required) and minor title changes (when an update to the existing bibliographic record would suffice and no new record was required).

The AACR2 and MARC 21 also call for separate bibliographic records to be created for each format in which a serial (and many other types of library materials) is available. MARC 21 Concise Format for Bibliographic Data in particular makes possible the differentiation of a wide variety of formats in which information may be contained. Each format has its own specific fields, thus the fields contained in a bibliographic record that describes material presented in electronic format will differ substantially from the fields in a record that describes material presented in print or in microform. In practice, it is argued, multiple bibliographic records describing the same material in different formats are confusing to library users. Thus some libraries choose to integrate the information from multiple records, that each describes material in a single format, into a single record that points to the library's holdings of that material in all formats. The debate has become particularly lively among serials librarians with the advent of electronic serials.

The future may hold still more changes for serials cataloging. During the 1990s, the International Federation of Library Associations' (IFLA) Study Group on Functional Requirements for Bibliographic Records (FRBR) developed a new conceptual model of the structure of the bibliographic record and its relationship with other records. In 2005, the Joint Steering Committee for Revision of AACR became the Joint Steering Committee for Development of Resource Description and Access (RDA)

and began work on a new set of cataloging codes that encompass the FRBR conceptual model.

Advances in technology have provided libraries with tools for creating and maintaining list of serials subscribed to or for which access is available as well as for linking from those lists directly to the electronic version of a serial or a fuller description of the library's print and/or microform holdings. Two of these tools are link resolvers and federated search engines. These tools use the Z39.50 standard for metadata exchange to facilitate information retrieval at the article, issue, volume, and title levels for serials. Although not restricted to serials, a link resolver facilitates a users' search for full text of a journal article, for instance, based on data from a citation discovered in an electronic index among the library's electronic resources. Based on that data, the link resolver searches the library's resources for access to the full text of the cited article.

Both link resolvers and federated search engines contain databases (sometimes referred to as knowledge bases) of bibliographic records that describe the electronic journals and other electronic resources to which the library subscribes. Serially published information is described on the article, journal, and aggregation level. That is, a knowledge base may contain records that describe the bibliographic characteristics of articles, journals, and/or collections of journals. Rules for the creation of these records vary from system to system but every library that makes such finding tools available to their users must first populate the systems' knowledge base with records describing their holdings. In other words, they must catalog them.

ACCESS BEYOND THE CATALOG

As noted in the previous section, the trend in access to serials in libraries extends beyond the OPAC. Technology allows access to serials for library users via lists like union lists and A-to-Z lists, collections of serials titles from publishers and aggregators, federated search engines, and link resolvers. Libraries also provide access to serials through services like interlibrary loan, course reserves, and document delivery. But advances in technology also complicate the library's provision of such services.

Historically, more than half of all interlibrary loan transactions are for serials. In 1976, the U.S. House of Representatives commissioned an ad hoc committee to create guidelines for interlibrary loan. The committee, the National Commission on New Technological Uses of Copyrighted Work (known as CONTU), created guidelines that allow libraries to distribute not more than six articles per year from any one serial but limited the application of this rule to issues published within the past five years.^[1]

While the availability of electronic serials improves the ability of academic libraries to work with faculty to make electronic versions of articles available to their students

via the library's Web site, the Digital Millennium Copyright Act of 1998 requires that permission be obtained and fees be paid to the authors and/or publishers. The Copyright Clearance Center (CCC) (<http://www.copyright.com>) is a clearinghouse through which such permissions may be obtained and fees paid. Many libraries assist faculty in doing so by maintaining an account with the CCC and, sometimes, budgeting for the payment of fees through the CCC.

Protection of copyright is also at issue when libraries make electronic serials available to users. Publishers and aggregators require libraries to restrict access to electronic serials to authorized users. Although authorized users usually includes anyone within the walls of the physical library, remote users (e.g., those using the library's Web site from outside the library) are usually required to identify themselves somehow (authenticate) before being allowed access to an electronic serial via the library's Web site.

Restricting access to authorized users is currently accomplished by the library in several ways. The library may choose to register the Internet Protocol (IP) addresses of computer workstations within the library. Only those patrons who are using computer workstations whose IP addresses are recognized by the publisher or aggregator's servers are allowed access. This, however, requires that users be physically in the library in order to access electronic serials. Libraries may also choose to allow users who are outside the library building to access electronic serials by implementing a system of authorization. A list of authorized users is maintained in the library's ILS. Each time an off-site user wishes to access an electronic serial to which the library subscribes they are required to enter identifying information that matches information stored in their record in the ILS before being granted access.

Because of the restrictions placed on access to electronic serials, publishers and aggregators almost always require the library to sign a contract or license agreement in which the library agrees to restrict electronic serials access to authorized library users. The negotiation of license agreements is often seen as a cumbersome and time-consuming practice for librarians. Library participation in consortial purchases of electronic serials can alleviate this to some extent since license agreements for consortial purchases are usually negotiated once on behalf of all participating libraries. There is also currently a desire among librarians to develop a standard license agreement that would alleviate the need for every library to negotiate a new (and often different) license for every electronic serial subscription or bundle that is purchased. One such initiative is SERU: Shared E-Resources Understanding (<http://www.niso.org/committees/seru>).

Not all electronic serials publishers restrict access to their publications through the payment of subscription fees. Dubbed Open Access (OA) publications, these electronic serials are made freely available to anyone with

Internet access. OA publications may be (and many are) peer reviewed and contain reports of scholarly research. In lieu of garnering profit from subscription payments, many publishers require authors to pay a fee (upon acceptance of an article by reviewers or editors) for publishing in their journals. This practice remains controversial and has yet to gain the full acceptance of authors. In 2005, the U.S. National Institutes of Health (NIH) issued a policy that "requests and strongly encourages all investigators to make their NIH-funded peer-reviewed, author's final manuscript available to other researchers and the public" (NIH, 2005). A list of OA journals may be found in the Directory of Open Access Journals (DOAJ) (<http://www.doaj.org/>).

MAINTENANCE

Serials in all formats require maintenance in order to remain findable to users. Technological advances provide vastly improved means of serials maintenance. The adoption of ILS and OPACs in libraries in particular allows libraries to more accurately track and maintain serials.

Prior to migrating to the ILS, libraries tracked receipt of serials via KARDEX, a series of cards filed in alphabetical order by title on which the receipt of each new issue was recorded. Card catalogs provided information as to whether or not a library held a subscription to a serials title but a trip to the shelves (or microform cabinets) was required in order to discover whether the volume and issue sought was available. The ILS provides electronic check-in cards as well as linking between electronic check-in cards and bibliographic records. Electronic check-in cards are displayed in the OPAC (along with holdings statements) and provide information such as the expected date on which the next issue of a serial will be received and the status of each issue (e.g., on the shelf or at the bindery).

Use of an ILS in conjunction with EDI allows libraries not only to electronically transmit claims information to publishers and subscription agents but also to receive electronic invoices from them. Electronic receipt of invoices reduces the time required to obtain and process them. It also reduces human error in entering the volume and issue or other payment information into electronic payment or order records (which, like electronic check-in records are linked to bibliographic records) in the ILS since line items from electronic invoices can be downloaded automatically.

Tracking serials in an ILS dramatically improves the library's ability to identify not only late or missing issues but also to identify lapsed subscriptions. An ILS also has the capability of processing reports of library expenditures on serials, serials holdings by subject (which can be invaluable in selection), and circulation levels.

The adoption of the ILS is only one way in which automation assists libraries with serials maintenance. As

noted above, links from bibliographic serials records have the capability to provide the user with links to electronic journals. But, as has also been noted, libraries often provide multiple access points to serials, all of which require some maintenance. For instance, when an electronic journal changes publisher, the new publisher information (and likely a new link) will need to be added to an A-to-Z list and the old information removed. When a publisher pulls a publication from an aggregation or bundle, this information must be edited in A-to-Z lists as well as in link resolvers and federated search engines. Luckily, most of these tools include some level of automated communication with aggregators and publishers so that many times the editing of records in knowledge bases happens as a matter of course.

ILS and other electronic tools that provide serials access also usually provide usage statistics which can be extraordinarily helpful in making selection and deselection decisions. Automated usage statistics for electronic serials have a reputation for being much more accurate than measures of print and microform serial usage. Usage of noncirculating print and microform serials collections in particular is notoriously difficult to measure accurately although use of radio frequency identification (RFID) technology in conjunction with the ILS offers more accuracy than do hand counts. Project Counting Online Usage of Networked Electronic Resources (COUNTER) is an international initiative that sets standards for the collection and reporting of usage statistics. It allows libraries to compare usage statistics reported by different vendors, publishers, and aggregators giving an assurance that all entities involved are using terms and statistics consistently. The provision of "COUNTER compliant" usage statistics is often a criterion used to evaluate a vendor of electronic serials.

Automation via ILS and other electronic tools allow libraries to more easily identify gaps in serials holdings. Gaps may occur in serial holdings in any format although they are most prevalent in print holdings. Filling gaps in print collections facilitates preservation by allowing libraries to bind full volumes of serials. Gaps in recent holdings may be filled via claiming but most publishers set a time limit beyond which they cannot guarantee their ability to fulfill a library's claim. Other means of filling gaps in print serials collections include back file purchases and participation in duplicate exchanges. Back file purchases, that is, the purchase of older issues of a serial, may be made from publishers or firms that specialize in providing fulfillment of older serials issues. Duplicate exchange services are groups of libraries which communicate the availability of duplicate issues (or issues that are to be pulled from a collection for other reasons) of print and microform serials. Communication is often accomplished electronically via e-mail or listserv. Needed issues are donated to the needy library for the cost of postage or shipping.

PRESERVATION

Print serials have long been preserved by binding loose issues in hard cover or by replacing print issues with microform (which has the advantage of saving shelf space). Preservation is particularly important for print serials, which are subject to loss or damage because of their size and shape, in order to provide continuing access to their contents.

Binding may be accomplished by a professional bindery or in-house. Professional binding being preferred since it generally ensures a more durable unit than does in-house binding, via binders, binder rings, and/or string and cardboard covers. In 1986, the Library Binding Institute published standards for library binding and they were included in American National Standards Institute/National Information Standards Organization (ANSI/NISO) standard Z39.78 for Library Binding. The standard describes the technical specifications for binding serial publications for libraries. For instance, a bound periodical should have a strong spine that is flexible enough to allow it to be opened face down on a copier or scanner so that a complete page image can be obtained without breaking the spine.

As mentioned, an alternative to binding serials for purposes of preservation is replacing them in another, often more compact format from which individual pages or issues can be less easily removed. Traditionally this meant microform although during the late 1990s there was a surge of serials publication on CD-ROM. Both formats share the advantage of taking up less space in the library and the disadvantage of requiring the use of machinery in order to access the content (a reader printer in the case of microforms and a computer workstation with a CD-ROM drive and sometimes additional software in the case of a CD-ROM). One of the reasons for the short-lived popularity of serials preservation on CD-ROM was that it was followed so quickly by the widespread use of the Internet for delivery of serials.

The availability of serials on the Internet has sparked controversy in discussions of preservation. Electronic communications technology allows libraries to provide their users with access to more and more serial publications but, as noted above, the library does not necessarily own all of these publications. Librarians are understandably concerned about the loss of control over their ability to provide their patrons with perpetual access to serials. License agreements prevent libraries from downloading the entire contents of one or more serial publications, even for purposes of preservation. Some license agreements for electronic journals provide for perpetual electronic access and some do not. Often, perpetual access rights can increase the cost of an electronic serial. And even if the publisher or aggregator promises perpetual access it is easy to imagine scenarios in which that access might be lost and the promise reneged upon (e.g., bankruptcy or even mergers between publishers).

In response to concerns over preservation of electronic content including serials, the Lots Of Copies Keep Stuff Safe (LOCKSS) program was initiated at Stanford University in 1999. It was released into production in 2004 and now is funded by contributions from the member libraries of the LOCKSS Alliance. LOCKSS allows libraries to create, preserve, and archive local collections thus promoting ownership of electronic information. "A library uses the LOCKSS software to turn a low-cost PC into a digital preservation appliance (a LOCKSS box) that performs four functions" (LOCKSS Web site): collect content, searches for changes in that content and makes replacements as necessary, provides access to stored content for library users, and provides Web-based administration that allows library staff to manage their LOCKSS box. LOCKSS allows libraries and publishers to retain their traditional roles in the serials information chain and provides for the safe keeping of otherwise ephemeral content.

The Controlled LOCKSS (CLOCKSS) initiative is a private LOCKSS network currently being pilot tested by seven host libraries. Whereas LOCKSS allows libraries to preserve their own collections, the function of CLOCKSS is to comprehensively preserve scholarly information and to make it available to the public if and when "no publisher has current responsibility for, nor is providing electronic access to selected content" <http://www.clockss.org/clockss/Home>. Current membership is made up of six U.S. and one U.K. libraries and eleven publishers. The pilot program is expected to conclude in 2008 at which time membership will be opened to additional libraries and publishers.

WEEDING

Although the technological advances of the late twentieth and early twenty-first centuries provide libraries with numerous alternatives to removing serials titles from their collections libraries can and do still weed. Shrinking shelf space and the publication of more and more new serials titles continue to make weeding or alternatives to weeding, like off-site storage, necessary. Users and user needs continue to change and serials titles that were relevant to users at the time they were selected often become less relevant and relatively more expensive to house and maintain. Weeding need not be a controversial or painful task in these days of electronic serials, especially if done on a consistent schedule, since alternatives like trading ownership for access or document delivery exist.

Criteria for weeding closely resemble criteria for selection and a well-written and maintained serials collection development policy can make weeding the serials collection less of a chore. Measured use of serials in all formats facilitates weeding. Unused titles may be replaced in a more compact format or made accessible via document delivery. In some disciplines, the information contained

in serials will become obsolete more quickly than in others. On the other hand, some serials may be of greater historical value than others. Bound volumes are often lesser candidates for weeding because of the financial investment in their preservation. As in selection, support of user activity and/or interest should be considered as should availability of finding tools like indexes.

In addition to the alternatives to complete deselection from the library's collection mentioned above, a library may consider off-site storage for relatively low use print and microform serials. Larger libraries in particular may choose to store less used print or microform serials in a storage facility separate from or in a remote part of the main library. There are costs to be considered for this choice including the cost of the space in which the serials are housed; either in terms of rent or in terms of other uses to which the space might be put. Also to be considered is the cost in staff time in retrieving items from off-site or remote storage when they are requested by users. The cost of off-site storage of print and microform serials makes it less likely to be considered by smaller libraries.

CONCLUSION

The past two decades have been full of upheaval and change for serials management. New technologies allow libraries to make far more serials available to their users than ever before and to manage those serials more efficiently and effectively as well. Textbooks on the topic of serials management that were written in the 1990s often included a chapter or section containing predictions about the future of serials management. For example, Nisonger^[5] correctly predicted the delivery of faculty research via university servers. Faculty research is being made available via institutional as well as disciplinary repositories like the California Digital Library, the Texas Digital Library, and the ArXiv.org Physics Archive.

Other predictions that have yet to come to pass include the full acceptance of the scholarly writing in electronic journals, required OA to articles describing the results of federally funded research, and the demise of the print and/or microform versions of serials. Some of these predictions may yet occur and may even already be occurring and some may never occur. The one constant that can currently be applied to serials selection and management is change.

Serials Vendors [ELIS Classic]

Karalyn Kavanaugh

Account Services Manager, EBSCO Information Services, Birmingham, Alabama, U.S.A.

Abstract

Libraries spend a substantial portion of their budgets on subscriptions to serial publications, such as journals, newspapers, yearbooks, and other periodical literature. Serials vendors do not house the publication issues; they act as the intermediary between the library and the publisher on behalf of the library. The consolidation of orders with one vendor makes serials management easier because of the combined, streamlined efforts made by the vendor on the customer's behalf with the publishers.

INTRODUCTION

Academic libraries spend 50%^[1] or more of the materials budget on subscriptions, some of which are electronic journal subscriptions. Medical, public, school, corporate, and special libraries and organizations spend 20–40% of their materials budget on serials. The price of journals in all categories of library organizations has increased dramatically. In 2002, colleges and universities spent approximately 36% more for subscriptions than they did in 1998 (Table 1). With the growth of publications in print and online, higher periodicals prices, and the decline of materials budgets in the late twentieth century and early twenty-first century, the role of the serials vendor is an important one in the purchasing and management of serials.

OVERVIEW

What Is a Serials Vendor?

Serials vendors are also called subscription vendors, periodical vendors, subscription agents, jobbers or dealers, and in the early days field agents or trade agents. Serials vendors do not house the publication issues; they act as the intermediary between the library and the publisher on behalf of the library. There are many serials vendors in the world, but as larger agencies swallow the smaller ones, fewer choices remain. See the American Library Association's publication, *International Subscription Agents*,^[2] for a list of the world's serials vendors. This book provides information needed to help make vendor choices. It includes information such as phone numbers, fax numbers, cable addresses, and toll-free numbers. Services offered, handling charges, invoicing procedures, prepayment policies, the transition process when moving from one vendor to another, as well as the agent's technological capabilities are included. It is arranged alphabetically by agent and by country.

In a broad sense, a term used to refer to all types of suppliers of serial publications (i.e., both Continuation dealers and Subscription Agents), and to distinguish them from suppliers of monographs. The term sometimes is used in a narrow sense to refer to vendors who supply serials other than periodicals (i.e., continuation dealers) and to distinguish them from Subscription agents. Serials Acquisitions Glossary, prepared by the Serials Section Acquisitions Committee of the Association for Library Collections and Technical Services, Association for Library Collections and Technical Services, 1993. Copyright 1993 by the American Library Association.

How Vendors Work?

Almost any publication of a serial nature from any place in the world can be ordered through large serials vendors. Newsletters, reports, newspapers, periodicals, magazines, journals, annuals, and yearbooks are the standard fare. The consolidation of orders with one vendor makes serials management easier because of the combined, streamlined efforts made by the vendor on the customer's behalf with the publishers. With one invoice, one renewal list, and one monthly follow-up claiming system, subscriptions are managed more effectively (Fig. 1).

Because customers do not always have all the subscription orders ready at one time, vendors will accept orders throughout the year. Often, the vendor will work with the customer and publishers to arrange a common expiration date for as many publications ordered as possible, which makes the process a more efficient one. At the time of renewal, the serials vendor sends the customer a renewal list showing the expiration date(s). The list is sent about 6 months before the subscriptions expire. Once the customer reviews the list for changes and additions and sends it back, the serials vendor places the orders and pays publisher in time for the subscription

Table 1 Five year price analysis from EBSCO information services, 2001. Five-year journal price increase history (1998–2002) data are based on proprietary sales data of select EBSCO subscription services customers of various library types. A sample of customers in good standing with a representative mix of U.S. and non-U.S. titles were selected for analysis

Library type	% of total titles	% of total expenditure	1998–1999 % increase	1999–2000 % increase	2000–2001 % increase	2001–2002 % increase	1998–2002 % increase
<i>ARL</i>							
U.S. titles	66.2	45.7	8.85	8.88	8.75	7.89	39.05
Non-U.S. titles	33.8	54.3	7.37	7.40	6.12	6.55	30.38

Fig. 1 Using a vendor versus ordering subscriptions directly with publishers, EBSCO Information Services, page 1.

to start the following year. This all seems fairly simple, but many exceptions arise when working with subscriptions. Publications aren't always published when the publisher says they will be. Titles can change names, change frequency, change format (i.e., from print to electronic), have delivery problems, be discontinued,

suspend publication, resume publication, merge with other journals, split off into two or more journals, or cease entirely. Publishers go out of business, merge with other businesses, publish through an organization that sponsors them, or set up other publishing arrangements. All of these events play into managing subscriptions.

Serials vendors help keep track of these changes and communicate them to the customers.

Reasons to Use a Vendor

Approximately 95% of libraries use one or more serials vendors to manage subscriptions. Customers find the ease of ordering, paying, and renewing their entire list of subscriptions annually through an agency saves time and labor. A large international vendor allows access to information on foreign and domestic periodicals and will provide price quotations, catalogs, and offer their years of experience with foreign publishers and currencies. Vendors use the relationships they have established with publishers to communicate the needs of their customers.

Some serials vendors provide the customer with one salesperson, one account manager, and one customer service representative who provide continuity in managing subscriptions. Technology has allowed smaller vendors to have equal footing with larger vendors in many ways. E-mail or online ordering allows for “instant” orders. Orders, invoices, claims, renewal lists, and serials management reports can be produced from the information housed in most vendor databases. Not all aspects of the serials-ordering process can be handled electronically, however. Some publishers and vendors do not have electronic data interchange (EDI) capability.

Two advantages of using a large vendor are their strong relationships with publishers and the number of print and on-line publications found in their more comprehensive databases. International serials vendors are also more likely to be able to communicate with and provide payments to publishers in their own language and currency. The advantage to libraries is that when the vendor does this part of the process, it frees the librarian to perform other aspects of the job.

Research Library Needs

The decision by a research library to begin a subscription to a journal has long-term effects. It usually requires a commitment to that publication for many years because the library hopes to provide the information from that journal to its users to fulfill their research needs. Research libraries strive to provide historical materials for as many years as the information is valuable to the users, which often requires the purchase of a back file for the new journals to which they subscribe. Vendors can often acquire the necessary journal volumes for the customer.

Organizational/Corporate Subscriptions

Organizations and corporations subscribe to many publications through serials vendors. The subscription service works the same for organizations as it does for libraries, although often the publications are ordered for individual

rather than organizational use. The organization gives the vendor the list of publications to order and the dates on which to start them. The vendor places the order with the publishers, pays for the subscriptions, and then invoices the organization for all the subscriptions ordered. The organization in turn pays the vendor's invoice. The vendor manages any problems that arise with orders or delivery of issues, which frees staff to do other jobs. This service also reduces the number of purchase orders and checks written that an organization might process if they were ordering each publication directly from the publisher. Libraries and other organizations may subscribe to thousands of subscriptions or as few as five. Although processing five checks to pay five publishers is not a huge task, writing thousands of checks to thousands of publishers is unmanageable and extremely costly and time-consuming. Accounting and business offices appreciate the services that serials vendors provide. Administrators can also track the flow of information coming into the organization based on reports provided by the serials vendor.

How Vendors Make Money

Serials vendors earn revenue from the discounts they receive from the various publishers whose titles are included in each customer's subscription order. By calculating the average publisher discount and comparing this to the estimated cost to service the customer's account, a vendor determines if a service charge or discount to the customer is warranted. The calculation is based on the mix of the list of titles ordered, those for which the publisher offers a discount versus those for which they do not. The current trend by publishers is to keep the discount formerly given to vendors, thereby making their titles “net” or “no discount” to customers. Some serials vendors have determined it is necessary to impose a “net title” charge, a flat fee, when the publisher does not give any discount to the vendor. This charge is intended to help the vendor recoup a portion of lost revenue. The vendor's concerns are to stay in business, stay solvent, serve their existing customers' needs, keep up with technology and expand their services while at the same time offering full service by handling all titles that publishers allow agents to order and service.

HISTORY

Subscription services have been around for many years. References in early library management books are few, but some references to vendor services have been noted since 1961. One of the first agencies to offer a consolidated subscription service to libraries was Frederick W. Faxon in 1886. The beginnings of EBSCO Information Services started in the late 1940s. Elton B. Stephens sold magazines door-to-door to pay his way through college,

and then continued by managing a periodical sales force through the Great Depression. The company he founded is now one of the largest serials vendors in the world.

New subscription agencies have started and others have expanded since the early 1960s. The U.S. federal government infused monies into research organizations to keep up with the rush to conquer space, which created programs that increased college enrollment. The number of serials titles published to support those programs led to larger library collections. Serials agents, such as Faxon, EBSCO, Moore-Cottrell, Hanson-Bennett, Franklin Square, Mayfair, Clark, Goldstein, Walter Johnson, Turner, and others, all small field agencies until that time, began to expand. As the publishing industry grew, so did libraries, library budgets, library buildings, etc., and likewise the need for a subscription agency to provide more journal titles and subscription management tools. Through the years, many agents bought smaller ones, both domestic and foreign, and the trend continues today. For example, EBSCO has purchased Franklin Square, Moore-Cottrell, Majors, McAinsh (Canada), Hill (New Zealand), Offilib (France), Lange and Springer (Germany), and others.

Publishers gave good commissions to field and trade agents in those days because the volume sold increased circulation. Higher circulation statistics allowed publishers to offer greater advertising opportunities and, in turn, reach greater sales and profit growth. As library orders grew, the commissions from publishers to agents did not. Often, the types of journals that were being ordered to support research were not those with advertising that would raise the publisher's revenue. Scientific, technical, and medical (STM) journals generally do not have advertising to boost revenue; therefore, publishers rely solely on paid subscriptions. Agents began adding a service charge to handle library accounts, their services to colleges, universities, research organizations and other types of libraries became more complex and even more essential. Commissions for handling such subscriptions are generally small. And most librarians believe that the service charge costs the library less than if it were to manage subscriptions in-house.

Early on, the management process was completely manual. Some agents kept records for orders to publishers in a card file called a wheelindex. Orders were hand-typed on 3" × 5" cards and filed in a box by publisher name. At the end of the week, they were counted by hand, photographed, and stored on microfilm. A summary of the orders and a check was typed and mailed to the publishers. All checks were hand-signed. Problem orders could be traced by reviewing the microfilm. Invoices to the customer were hand-typed and produced on a special ditto machine. They were hand-folded and mailed to customers biweekly. Renewal lists were produced at the same time as invoices and did not include prices. The renewal lists were filed by date and sent out approximately 6 months before time to renew. Follow-up reminder notices, when

necessary, were sent approximately 3 months later. Automating to use of keypunch cards in the 1960s allowed agents to place orders and keep records rapidly. Some management reports were produced on the basis of keypunched data. Automatic renewal list generation was developed. By the early 1970s, three of the large U.S. subscription agencies, Faxon, EBSCO, and Franklin Square, were automated, making the placement of orders, invoicing, claiming, and report generation easier and more efficient.

Changes in Libraries

The past 20 years have seen a dramatic change in libraries. Card catalogs of library materials have been replaced with online catalogs. Serials and other information vendors now interface with all aspects of acquisition, databases access, and management of serials and reference materials. Few printed indexes are being published. Content in electronic format, such as databases with indexes and abstracts, full-text articles, and individual journals, are available. There is a movement toward providing more full-text information in electronic format through the World Wide Web, with less physical space being required for shelving (i.e., "the virtual library"). Books available in electronic format are accessible through library workstations, handheld devices, or personal computers. But readers continue to enjoy printed books and periodicals; libraries will likely continue to subscribe to a combination of print and (electronic) e-resources.

Naturally, serials vendors are expected to remain current with changing information access capabilities and are helping to lead the way. Some now handle e-databases, e-journals (full text), e-indexes and abstracts, e-tables of contents, pay-per-view articles, alerting services, e-books, e-payment and procurement services, and e-resource usage and analysis reports.

Libraries are looking to vendors to assist with archiving data and preserving materials, but publishers are reluctant to give data to vendors for storage and management. Librarians are creating their own electronic archives for serial and monographic materials. It is a challenge to librarians, publishers, and vendors to resolve the issue of archiving and preserving digital data.

Interfaces with Integrated Library Systems

To manage and maintain materials in their collections, most librarians use automated or integrated library systems (ILS). The ILS is used for the public access catalog, circulation system, interlibrary loan, collection management, and report writing. It is, therefore, important for librarians to choose a serials vendor with proven interfacing experience with their current or planned ILS. Electronic Data Interchange (EDI) invoices are provided by some vendors for payment through the customer's

serials acquisitions module. For an exact exchange of data, some serials vendors and system vendors apply EDI $\times 12$ standards to their processes. Frequently used $\times 12$ transaction sets are Invoice, 810; Publisher price list, 832; Purchase order, 850; Claim, 869; and Functional acknowledgement, 997.^[3]

For the ILS to “talk” with the serials vendor database for claiming and invoicing, a link must be established between the two. Each record must have a vendor identification number and a Serial Item and Contribution Identifier (SICI) number, which is the ISSN from the bibliographic record. Several standards have been developed for library systems, as well as existing ones applied; these include the following: ANSI/NISO Z39; Electronic Data Interchange for Administration; Commerce and Transport (EDIFACT); and TRADACOMS (the UK standard for teleordering of books) with the help from the Serials Industry Systems Advisory Committee (SISAC). The International Committee for EDI in Serials (ICEDIS) was formed to standardize various parts of the routine exchange of business forms.

Serial orders in an ILS are different from book orders. Each book order is processed one time, and each order represents a unique item. The purchase order is entered into the ILS when the book is placed on order with a publisher; when the book arrives, it is processed and the bibliographic record is added to the catalog. Serial processing does not stop when the order is placed and the payment is made. A subscription is reordered each year and during the year issues arrive daily, weekly, biweekly, monthly, bimonthly, semimonthly, quarterly, annually, biannually, or even triannually. Each piece is received and recorded separately. Subscriptions might have billing adjustments or credits applied to them during the year. The ILS should be flexible enough to allow for all types of invoice activities and publication pattern changes.

Electronic Journals

At this time less than 10% of journals from the 60,000 active publishers in the world have developed electronic versions of their publications. Currently, electronic journals are primarily in the scientific, technical, and medical (STM) areas. As the titles change during the subscription term from print to print plus online or online only, some serials vendors provide the customer with updated information to adjust journal records in the ILS. As publishers become more comfortable with electronic publishing and provide access to the full text online, they usually change the offering to include a charge for online use. This charge is most often a percentage of the cost of the print publication. Initially some publishers required libraries to purchase print subscriptions to obtain the online full text.

Some large STM publishers offer their electronic journals only directly to libraries in a package, for a set fee. Because a serials vendor does not play its traditional role in the acquisition of these journals, this arrangement makes it difficult for a library's vendor to assist its staff with the management of those subscriptions. The librarian loses the benefit of vendor-supplied cost/invoice data on individual titles in the package as well as that of comprehensive serial management reports because those titles are acquired separately from the rest of their serial collection.

VENDOR SERVICES

Ordering

From the serial vendor's database of titles, the customer may choose from a few to thousands of titles. Orders usually can be placed through a Web-based ordering system, e-mail, fax, or produced in print form and mailed through the postal system. Large, international vendors handle most titles to which a customer might want to subscribe, currently approximately 260,000 titles from around the world. Most often, libraries order subscriptions for 1 year at a time, but subscriptions of 2- or 3-year terms are sometimes offered by publishers. Methods offered to aid in selection of publications typically include a print and/or online catalog of available titles, listing such information as title, price, publisher, ISSN, country of origin, currency, Library of Congress code, Universal/Dewey Code, term, where the publication is indexed, language, and publisher restrictions. Delivery options, such as surface, airmail, or electronic version, could also be included in the data.

Invoicing

Consolidated invoicing provided by a serials vendor reduces check writing and the numbers of invoices that accounting departments must handle. Consistent layout of the vendor's paper invoices and their inclusion of vital serial data usually make these documents valuable to librarians. Receipt of electronic invoices from the vendor through file transfer protocol (FTP) with EDI or EDIFACT standards also makes processing invoices easier.

Claiming

It is inevitable that some issues of a publication will not arrive at their destination as expected. For a research library with the purpose of collecting materials for research use, it is important to have every issue of every publication ordered. When an issue does not arrive as scheduled, the library staff must track it down to

complete the volume for binding. Serials vendors take on the task of asking the publisher to send the issue that did not arrive. This is called “claiming.” Claims are a major part of a vendor’s service. Sometimes the customer judges the vendor solely on its claim resolutions. Serials vendors who have developed good claiming systems and a reputation for getting fast results for issues claimed on behalf of their customers often use this fact in marketing their services. Most serials vendors assign customer service representatives to handle individual accounts; they establish a relationship with the customer to better meet the customer’s needs both in placing orders and resolving claims. Some integrated library systems and serials vendors have devised automated claiming procedures that pass from one system to another and onto the respective publisher, making claim resolution faster and more streamlined.

Renewals

Approximately 6 months before a subscription term ends, the serials vendor sends the customer a list of the titles ordered in the past year to use as a reminder to place renewal orders. After reviewing the list and making changes and additions, the customer sends it back to the serials vendor for renewal, allowing time for the orders to be entered. Once the vendor enters orders into its database, orders are sent with payment to the publishers in time to ensure uninterrupted service for the customer. Because it takes 6–10 weeks for a subscription to start, it is important for all parties to adhere to the renewal schedule to avoid gaps in service. By placing all orders at the same time, a customer pays one invoice for all of the subscriptions. The serials vendor pays each publisher with one transaction or money transfer for many customers’ orders.

Reports

Serials vendors not only offer title choices, place orders, send invoices, communicate with publishers, and solve claiming issues, they also provide reports based on the customer’s subscription list. Sorting subscription data in various ways allows the customer to evaluate the collection based on criteria such as cost, subject, or publisher. Reports can be designed to help librarians determine the titles published in a particular area of interest. Such reports can be programmed to show the titles on subscription or those to which the library does not subscribe. Collection managers can use these data to further develop the serial collection or to streamline it to better meet users needs. The vendor may allow the customer to use a fund/cost code to keep track of departmental expenditures. The vendor enters the designated fund/cost code and can then provide reports sorted accordingly to show the dollars spent in

that area of interest or for a specific customer department. Most serials vendors assign a subject or classification code to each entry in their title database so that reports can be produced by using various cataloging systems, such as the Library of Congress, the Dewey Decimal System, or the National Library of Medicine. Subscription price data collected by the vendor over time provides a way to review the collections based on cost history and pricing trends over a five year period. A customer may want to create lists by title, by cost per title, by country of origin, by publisher, by frequency of publication, and so forth, to meet their particular needs. The sorting and reporting capabilities are tremendous.

Services to Publishers

Serials vendors act as intermediaries between libraries and publishers and as partner with both. As many as 60,000 publishers work with serials vendors. Serials vendors develop relationships with publishers that are useful to their customers. Those relationships are based on a good understanding of each other’s services and years of doing business together. The vendor can act on behalf of the library to solve claiming issues and to work out areas of mutual concern (e.g., a name change of a publication, a change in numbering sequence, or other significant changes affecting subscriptions).

Serials vendors not only provide services to libraries and other organizations but to publishers around the world. Vendors provide customers to publishers. Orders and claims information are sent from vendors to publishers in EDI format when the publisher has the capability to accept electronic data. This speeds up transactions and eliminates keying errors. From translating correspondence to delivering payment with the orders, publishers receive comprehensive subscription service from vendors. Some vendors are involved in the delivery of serial information in all formats from the content supplier to the user.

Relationships with Other Organizations

Serials vendors enjoy relationships with other organizations and associations such as the Serials Industry Systems Advisory Committee (SISAC), International Committee on EDI for Serials (ICEDIS), CONSER, and numerous library and information-related associations. These organizations work together to standardize procedures and operating practices in the publishing world and to foster relations and increase understanding among the many and varied parties playing key roles in the distribution of information. Groups such as the North American Serials Interest Group (NASIG), the Timberline Institute, The College of Charleston Conference, and the North Carolina Serials Interest Group bring together vendors, publishers, and

librarians to discuss serial issues of mutual concern. Of interest to serials librarians might be the discussion list SERIALST, currently found at <http://www.uvm.edu/~bmacleenn/serialst.html>.

FUTURE ROLES

With the Internet and the Web-based services developed by serials vendors, customers can now generate renewal lists, management reports, and copies of invoices themselves. Serials vendors can interface with library systems such as SIRSI, Ex Libris, Innovative Interfaces, Inc., Endeavor/Voyager, and many more. EDI capabilities commonly assist technical service personnel in placing orders, paying invoices, and making claims. New automated business systems such as SAP, Ariba, Commerce One, and Oracle are being used in organizations. Each one can accept EDI to speed transactions, which helps manage information and library materials. Today more and more automated processes are being developed and used by key players in the serials industry. These greatly impact the efficiency of publisher, library, and serials vendor operations.

Future of Serials Vendors

Librarians want their vendor to be able to supply electronic journals and to negotiate the price and license agreement with the publishers. Some serials vendors include handling these requests as part of their basic services; others will do so in the future. Researchers want access to the top electronic journals in their fields. Customers expect serials vendors to provide a greatly expanded range of value-added services to assist with the myriad of tasks required to effectively manage electronic

journal subscriptions in addition to those for print publications. When ordering electronic journals for customers, the vendor needs to provide access services such as “turning on” (activating) the subscription. In the past, serials vendors worked primarily with serials and acquisitions departments in libraries and purchasing departments in organizations. Now they must also communicate with collection development staff, reference departments, campus legal departments, webmasters, and information systems staff. Other services that customers require for access to electronic journals include providing IP addresses to publishers, links to publisher websites, publisher contacts, contracts with consortia, and the archiving of license agreements.

A generic Standard License Agreement orchestrated by John Cox of John Cox Associates (UK), in association with five subscription vendors, is an example of the type of services serials vendors are providing to their customers. The license is in the form of a template that can be modified to accommodate the needs of libraries and corporations.

Libraries and other organizations have overwhelmingly embraced electronic content, and it continues to grow at breakneck speed (Fig. 2). Digitizing data (converting content into electronic format) enables a publisher to distribute content globally online and is provided through the operations of some serials vendors. The management of linking electronic journals to databases using OpenURL and SFX technology is taking place. The serials vendor continues to be the electronic serial manager for a library and can act as the aggregator of electronic information. Aggregators provide electronic gateways to many publishers' websites and full-text e-journals.

Publishers are looking for ways to control the financial stability of their companies and solutions to the concern

E-Journal Progression

Fig. 2 Rise in number of electronic journals, EBSCO Information Services, page 9.

for preservation of materials. The issues of copyright and fair options to access are also critical to publishers. Serials vendors are working with the publishers and programmers, the courts and the librarians, and library organizations to keep these issues from colliding. All concerned parties are awaiting court decisions on various matters of copyright. Just as they have for decades with print publications, serials vendors play a vital role in the delivery of information in all formats, whereas librarians, vendors, and publishers continue to work together to reach their common goal of providing serial information to their users.

Abstract

Shared libraries are partnerships between school libraries and public libraries, university libraries and public libraries, community college libraries and public libraries, and any number of other combinations of library organizations. This entry will discuss the shared library as a distinct library type, outlining the major political, fiscal, management, planning, information technology, public policy, and evaluation issues. Examples of shared libraries will be described as a means of illustrating differing management models and to identify areas of the world where joint libraries are most prevalent.

INTRODUCTION

Shared libraries or joint-use libraries as they are sometimes called have been in existence in the United States and other parts of the world for decades. Historically, these libraries have been school-housed libraries where the public library has located a community branch library in a school building. Increasingly, joint-use libraries include university, college, and community college libraries partnering with public libraries to create a shared-use facility that serves as the university or college's academic library and serves as either the main library or branch library of a public library system.

DEFINITIONS

Joint-use libraries can be defined in a number of different ways. Dr. Alan Bundy, past University Librarian at the University of South Australia and prolific writer on the topic defines a joint-use library as "a library in which two or more distinct library services providers, usually a school and a public library, serve their client groups in the same building, based on an agreement that specifies the relationship between the providers."^[1] Ken Haycock, Director of the Graduate School of Library and Information Sciences at San José State University, defines dual-use libraries as "a common physical facility from which library services are provided to two ostensibly different communities of users."^[2]

TYPES OF JOINT LIBRARIES

Virtually, any type of library can merge or partner with another type of library to form a shared-use or joint-use

library. For example, there are and have been many joint school/public libraries in existence in rural areas of the United States and other parts of the world, specifically Australia and New Zealand since early in the twentieth century. The first Joint-Use Libraries International Conference held in 2007 included presentations representing many different kinds of joint-use libraries, including public, school, community college, university, health care, community center, municipal government, and vocational libraries—all partnering in some manner with another to form a shared-library space. These partnerships are similar in that two or more different library client groups are served from one shared-space facility while at the same time each is developed in a way unique to the local community needs, whether political, fiscal, or cultural.

POLITICAL AND FISCAL MOTIVATIONS

The impetus for the development of a shared-use library often comes from policy makers that perceive it as a way to address several goals and problems. Commonly, two different levels of government publicly fund such libraries. Sharing the costs of building, staffing, maintaining, and developing collections can be more cost effective than building and operating separate library facilities. In addition, the resources included in these buildings, including the collections, technology, staff, and facilities such as group study rooms and meeting rooms are readily available to more of the taxpayers who are the primary funders. Private, philanthropic funders may be more willing to contribute to a joint-use library. Policy makers are well aware that the access to information available today via the Internet makes it increasingly difficult to justify the barriers to access that exist when libraries serve more limited communities of users.

Many school/public libraries are developed to serve rural population or communities that are growing and now have a need for both new schools and community amenities, such as parks and public libraries. Policy makers see an opportunity to place such amenities in one central convenient location.

BENEFITS AND OPPORTUNITIES

Every proposal for a joint-use library has the potential of synergy, of creating a whole that is greater than the sum of its parts. Fulfilling that potential begins with the intergovernmental agreement for construction, operation, and the building's physical design. The intergovernmental agreement will specify the mission of the library, the roles of the partners, their funding and staffing obligations, ownership of the building and its contents, its governance, and conflict resolution. It may have a finite length, or specify terms and conditions of termination of the agreement. The building design will reflect the terms of the agreement. For example, if the agreement stipulates that two libraries will operate as entirely separate entities, the building design will allow for separate entrances, collections that are in an area accessible only to a specific group of users, and different hours of service.

Dr. Alan Bundy has identified a number of specific ways in which joint-use libraries can provide more efficient use of public money. These include sharing of design, construction, and facility maintenance costs, sharing of staffing costs, and access to collections, including online resources. Less obvious, but also very important, is the opportunity to locate local history and archival information of interest to the entire community in one place and the possibility of providing more hours of service. Another advantage of having more staff members than the partners would each have in stand-alone facilities is that the skills, talents, and interests of the staff are broader and deeper. In a small joint-use library, staff may have more variety of tasks, as well as opportunities for professional growth and stimulation.^[3]

OPERATIONAL ISSUES

Every joint-use library must address a number of the same issues about how the library will function. Many of these will be specifically included in the intergovernmental agreement; others will be developed as specific procedures or policies that are documented in supplementary agreements that can be modified by operational managers as needed. Operational policies, accompanied by specific procedures in larger or more complex shared libraries, must be developed for the entire range of services. These include in-house use and circulation of materials, use of computers and online resources, and collection development

policies. Licensing agreements for online resources need to provide for use by all library patrons. The partners will have to decide on ownership of collections (shared or separate). Most commonly, each partner retains ownership over materials purchased with its funds in order to ensure that the needs and requirements of its users are met. If shared, the partners must decide how the acquisitions budget will be apportioned to best meet the needs of all users.

The management and operation of technology in the shared library requires careful planning and ongoing attention. Often, one or both of the partners in a shared-use library operate other library facilities and therefore the joint-use library may be part of a larger network or networks. The holdings of the joint-use library and of other libraries in the network need to be included in an Online Public Access Catalog (OPAC). A shared-library Web site can present the library to all users as one library serving different user groups. Policies and procedures regarding use of computer resources must be set. As bandwidth requirements increase, the partners must develop and implement improvements to their network.

Library services and collections change more quickly now than in the past. The partners must have a way to alter these, as well as the way space is used in the library, as user needs change. In addition, provision for future expansion of the building should be addressed in the agreement and design. The library will eventually require renovation and replacement of building systems (i.e., lighting, electrical, heating, and air conditioning) and how the partners will share those costs should be included in their agreement. The partners must agree about building operations, including janitorial services, building maintenance and repair, security, and utilities. They must agree about who will provide these functions and how the costs will be shared.

Many joint-use libraries are located on a school, community college, or university campus. It is important that the building be sited in a way that makes its accessibility to both the campus community and the general public both clear and obvious. Often, this means that the library is located at the entrance to a campus or on an edge of the campus adjacent to the community. The College Hill Library in Colorado is a library shared by the City of Westminster and Front Range Community College. The library is located on the edge of the campus. A public parking lot is near the entrance to the first floor, designated as the Westminster Public Library. The second floor, allocated as the community college library, can be accessed via stair or elevator from the first floor, as well as from an entrance that faces the other community college buildings and student/staff parking.^[4]

Key to the long-term success of a shared library is its ability to meet the needs of its different user groups and of the partner organizations to provide library services. Effective decision-making and administrative accountability are necessary. The administrative and staffing

model for the shared library will be identified in the intergovernmental agreement. There are several options, each of which brings with it operational challenges. A director can be employed by one of the partners that have agreed to be responsible for the management and operation of the shared library. All other staff are employed by that partner. In those cases, the second partner may have a consultative role in the selection and evaluation of the manager of the library and perhaps of the other staff too. In essence, the second partner is contracting for services from the first. The second partner may feel that the needs of its users or of the parent organization itself are difficult to assert and negotiate, especially as they change over the years. It is also possible that the contracting partner may lose commitment to and interest in the partnership over time.

In a second model, the intergovernmental agreement establishes a governing board consisting of representatives from the two partners. The governing board employs a director who reports to it. Generally, one partner acts as fiscal agent and employer of remaining staff, who report to the director. Staff previously employed by the partner that is not the fiscal agent may become employees of the fiscal agent, and in that case the specifics of a change of employment including salaries, benefits, seniority, and other terms and conditions must be worked out. The governing board sets the schedule of operation and other policies to meet the needs of both partners.

In a third staffing model, codirectors hired by each partner share the responsibility for managing the library. Each partner has employees working together under the direction of their respective codirector in the shared library. In these cases, issues of differing methods and standards for performance evaluation, varying job descriptions, career paths and pay scales, arise and must be dealt with. In addition, a staffing model that has employees of two jurisdictions working together requires that the codirectors and employees be flexible enough to create a shared organizational culture while participating effectively in the cultures of their parent institutions. It is essential that the codirectors be committed to the success of the shared library and can work as a team. Although administratively the most complex of the options, each of the codirectors is responsible for ensuring that the needs of their users and partner organization are met.^[5]

ORGANIZATIONAL MODELS OF MANAGEMENT

University/Public Joint Libraries

Within the parameters of the various definitions given for shared libraries, a variety of university/public library models have been developed. NOVA Southeastern University, a private university, administers the Alvin Sherman Library, Research, and Information Technology Center, an integrated joint-use library with Broward County Public

Library system. In this scenario, the University manages the large shared facility including supervision of all staff and librarians who have become university employees. The County provided funding for the construction of the building, which opened in 2001 and provides funding to the University for operating expenses. All services and programs, as well as access to all collections, are available for all members of the community, both the university community and the Broward County community at large.

In St. Paul, Minneapolis, the Metropolitan State University Library and the Dayton's Bluff Branch of the Saint Paul Public Library System, cohabitate within a shared-use library facility. In this model, each of the library organizations controls, staffs, and manages their respective collections, services, programs, and other functions. Although library users aged 13 and up have reciprocal borrowing privileges from both collections, there are two circulation desks and two library cards. This model, where the public library leases space in the building from the University, is characterized as a partnership and not a merger.

A third model, unique to the previous two examples, is the Dr. Martin Luther King, Jr., Library (King Library), a partnership between the San José State University Library and the San José Public Library (Fig. 1). Like the Metropolitan State University Library and the City of St. Paul, the university library and the public library have retained their autonomy and identity as a university and a public library organization, respectively. However, like NOVA Southeastern University and Broward County Public Library, the libraries have merged services, programs, collections, and most significantly, staffing in four of the major functional areas of the library—circulation, information technology, reference, and technical services. All library users have access to all collections and reciprocal borrowing privileges, as well as use of the entire building. This hybrid model, where the shared library space is comanaged by two distinct and autonomous library organizations, is the largest such library in the world.

Joint School/Public Libraries

The most common type of joint-use library is the public school/public library combination. Research shows that there are common issues, advantages, and disadvantages to these partnerships, whether in the United States, Canada, or Australia. As with any type of library, the school library and the public library have missions and goals that are unique to their community, as it is defined. A public school librarian's goals are to support the school curriculum and to collaborate with classroom teachers to teach information literacy across the curriculum. The public library has a much broader mission—that of providing access to information, recreational resources, and lifelong learning for the entire community, not just the school-aged. Although these

distinct missions can create tensions within a joint library, many such libraries have been highly successful. Dr. Ken Haycock identifies 10 criteria for potential success including the necessity for a legal written document, one librarian in charge of the library, a fully integrated facility, and a single independent decision-making board among others.^[6]

JOINT LIBRARIES AROUND THE WORLD

South Australia has been a leader in the world in developing joint-use libraries and formulating strong public policy that supports school/community libraries. In addition to Australia, New Zealand, Sweden, and Canada, there is ongoing development and planning of such partnerships in England and Scotland. Although the United States has had school/public shared-use libraries since the early twentieth century, with the exception of the joint libraries in Florida and the San José model, the development of new joint-use libraries has been slow.

JOINT LIBRARIES AS REPLICABLE MODELS

The question regarding joint-use libraries that needs to be addressed is whether the models that now exist, as varied and unique as they are, can be replicated in other settings. The Dr. Martin Luther King, Jr., Library in San José, California, receives visitors from around the nation and the world. The impetus for many of these visits is a desire

on the part of a municipal official or university administrator who seeks to explore the idea of a joint library as a means to mitigate the costs of building a new library facility for their constituency. After 4 years, the King Library remains the largest joint library in the world and the number of joint university and public libraries has not grown significantly. Will the joint libraries now in existence serve as models for future development? Will other large metropolitan city libraries partner with large university libraries, thus building on the NOVA Southeastern University and San José State University partnerships with the public library systems in their regions? If this does not come to pass it may be because the joint library phenomenon is tied to the specifics of the region, the organizations, and the leadership at a given time in the history of the community. In each of the joint libraries that have been developed in the United States in recent years, there have been strong local leaders and unique regional factors that made the project both feasible and ultimately successful.

EVALUATION AND ASSESSMENT

Evaluation and assessment of libraries, their services, programming, access, collections, and relevance to library users is essential for creating truly library-user centered libraries. Academic libraries as integral players in the educational institutions within which they serve have been moving from identifying inputs and outputs to becoming

more outcomes based. Joint libraries, regardless of the management model, are complex organizations requiring significant attention and intentionality with all decisions and new initiatives, whether they are specific to one or the other of the organizations, or to the joint operation. Evaluation and assessment in this context requires that not only the success of the joint library must be evaluated, but also the effectiveness of the services and support to the home constituency must also be examined critically. In order for the joint library to be successful, the service to the individual constituencies must be as good as or better than it was before the partnership. The Dr. Martin Luther King Jr., Library made provisions for the evaluation of the effectiveness of the merger well before the library opened. Surveys were conducted to measure the satisfaction level of library users prior to the merger and then twice after the merger. Overall, customer perceptions of the library programs had improved after the merger. As the library now begins to develop a more user-centric philosophy of service, a new approach to evaluation will be needed.

PUBLIC POLICY AND JOINT-USE LIBRARIES

Joint libraries have prospered in regions where public policy makers have advocated for such partnerships. This has occurred in South Australia, the United Kingdom, and in the United States. For example, in the United Kingdom, public policy actions have supported the development of many new joint libraries in the recent years. These joint initiatives are seen as politically attractive in light of New Labour policy initiatives.^[7] Many of the joint-use libraries in the United States were initiated because of the expected cost savings and not because of explicitly stated public policy issues such as bridging the digital divide, building economic development in the community, the importance of a well-informed citizenry to participate in civic matters, the need to build social capital, or the public good inherent in providing lifelong learning opportunities for all of the community. As joint libraries evolve and demonstrate through research, evaluation, and assessment that the benefits to the communities are significant, these policy matters may become more explicit.

CONCLUSION

Shared libraries have developed around the world in response to local needs, strong and creative leadership, and actions of public policy makers. As these libraries evolve over time, and as new joint initiatives take shape, their efficacy will be determined. In each case, many of the same issues are of concern—those of staffing, budgeting, management, alignment of missions, development of policies and procedures, the use of emerging technologies to provide service, and access to collections. The benefits and

opportunities, as well as the challenges that present themselves are considerable, thus making the joint library a significant institution in society.
